• Accessory drive belt noise, squeal or chirping	• Defective/worn or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of the accessory drive belt or pulleys • Damaged or worn accessory drive belt tensioner • Damaged pulley grooves	• CARRY OUT the Engine Accessory Test. REFER to **NOISE, VIBRATION AND HARSHNESS** article. INSPECT components and INSTALL new parts as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Clunking noise	• Coolant pump has excessive end play or imbalance	• CHECK the coolant pump for excessive end play. INSPECT the coolant pump for imbalance with the drive belt off. INSTALL a new coolant pump as necessary. REFER to **ENGINE COOLING** article. TEST the system for normal operation after the repair.

• Whine or moaning noise	• Air intake system	• CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
• Whistling noise - normally accompanied with poor idle condition	• Air intake system	• CHECK the air intake ducts, air cleaner, Throttle Body (TB) and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary. TEST the system for normal operation after the repair.
• Hissing noise - occurs during idle or high idle that is apparent with the hood open	• Vacuum leak	• USE the EngineEAR/ChassisEAR to locate the source. SCAN the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new component. TEST the system for normal operation after the repair.
	• Vehicles with a plastic intake manifold	• Acceptable condition. Some plastic intake manifolds exhibit this noise, which is the effect of the plastic manifold.
• Grinding noise - occurs during engine cranking	• Incorrect starter motor mounting	• INSPECT the starter motor for correct mounting. REPAIR as necessary. REFER to **STARTING SYSTEM** article. TEST the system for normal operation after the repair.
	• Starter motor	• CHECK the starter motor. INSTALL a new starter motor as necessary. REFER to **STARTING SYSTEM** article. TEST the system for normal operation after the repair.
	• Incorrect starter motor drive engagement	• INSPECT the starter motor drive for wear or damage. INSTALL a new starter motor as necessary. REFER to **STARTING SYSTEM** article. TEST the system for normal operation after the repair. • INSPECT the flywheel/flexplate for wear or damage. INSTALL a new flywheel/flexplate as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, front of engine - knocking noise from lower front	• Damaged or separated crankshaft pulley/damper	• CHECK for obvious signs of damage or wobble during operation. INSTALL new as necessary. Refer to the appropriate Engine article for the procedure. TEST the system

of engine		for normal operation after the repair.
• Engine noise, front of engine - ticking, tapping or rattling noise from the front of the engine	• Timing drive components	• REMOVE the accessory drive belt. Refer to the appropriate Engine article for the procedure. • USE the EngineEAR to isolate the noise to the engine front cover. • REMOVE the engine front cover and INSPECT the timing drive components. INSTALL new parts as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, upper end - ticking noise near the fuel rail and intake manifold	• Fuel rail clip	• CHECK for loose or damaged fuel rail clip (s). REPAIR as necessary.
	• Fuel injector	• USE the EngineEAR to isolate the noisy injector(s). INSTALL a new injector(s) as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, upper end - ticking, knocking or rattle noise that occurs during idle or high idle during the first cold start of the day and may disappear as the engine warms	• Valve train noise (bled down lash adjuster)	• CARRY OUT the **Valve Train Analysis**. INSTALL new parts as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, upper end - occurs mostly with a warm engine at light/medium acceleration	• Worn or damaged spark plugs	• REMOVE the spark plugs. INSPECT and INSTALL new as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
	• Carbon accumulation in combustion chamber	• Bore scope the cylinder. ELIMINATE carbon buildup. TEST the system for normal operation after the repair.
• Engine noise, upper end - rattling noise from	• Low oil level	• CHECK the oil level. FILL as necessary.

the valve train. Worse when the engine is cold	• Thin or diluted oil • Low oil pressure • Worn valve train components • Worn valve guides	• INSPECT the oil for contamination. If the oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter. • CARRY OUT an oil pressure test. If not within specifications, REMOVE the engine oil pan. Refer to the appropriate Engine article for the procedure. INSPECT for a blocked oil pick up tube. • CARRY OUT the **Valve Train Analysis**. INSTALL new parts as necessary. TEST the system for normal operation after the repair. • CARRY OUT the **Valve Guide Inner Diameter**.
	• Excessive runout of the valve seats on the valve face	• CARRY OUT the **Valve Seat Inspection**.
• Engine noise, upper end - pinging noise	• Gasoline octane too low • Knock Sensor (KS) operation • Incorrect spark timing • High operating temperature • Spark plug	• VERIFY with customer the type of gasoline used. CORRECT as necessary. TEST the system for normal operation after the repair. • CHECK the KS. INSTALL a new KS as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair. • CHECK the spark timing. REPAIR as necessary. TEST the system for normal operation after the repair. • INSPECT the cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. VERIFY the engine operating temperature is within specifications. REPAIR as necessary. TEST the system for normal operation after the repair. • CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary. TEST the system for normal operation after the repair.

	• Catalytic converter	• COMPARE with a similar vehicle for what is acceptable noise.
• Engine noise, lower end - ticking or knocking noise near the oil filter adapter	• Oil pump	• USE the EngineEAR to verify the oil pump as the source of the noise at low rpm. REPAIR as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, lower end - light knocking noise, also described as piston slap. Noise is most noticeable when the engine is cold with light to medium acceleration. The noise disappears as the engine warms	• Excessive clearance between the piston and the cylinder wall	• INSTALL a new short block. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, lower end - light double knock or sharp rap sound. Occurs mostly with a warm engine at idle or low speeds in drive. Increases in relation to engine load. Associated with a poor lubrication history	• Excessive clearance between the piston and the piston pin	• INSTALL a new short block. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, lower end - light knocking noise. The noise is most noticeable when the engine is warm. The noise tends to decrease when the vehicle is coasting or in NEUTRAL	• Excessive clearance between the connecting rod bearings and the crankshaft	• INSTALL a new short block. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.

• Engine noise, lower end - Deep knocking noise. The noise is most noticeable when the engine is warm, at lower rpm and under a light load and then at float	• Worn or damaged crankshaft main bearings	• INSTALL a new short block. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine noise, rear of engine - knocking noise at rear of engine	• Damaged flywheel/flexplate	• CARRY OUT the **Flywheel Inspection** or the **Flexplate Inspection**.
• Engine vibration - vibration felt at all times	• Excessive engine pulley runout	• CARRY OUT the Engine Accessory Test. REFER to **NOISE, VIBRATION AND HARSHNESS** article. INSTALL a new engine pulley as necessary. TEST the system for normal operation after the repair.
	• Damaged or worn accessory component	• CARRY OUT the Engine Accessory Test. REFER to **NOISE, VIBRATION AND HARSHNESS** article. REPAIR or INSTALL a new component as necessary. TEST the system for normal operation after the repair.
• Engine vibration - at idle, a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan	• Cylinder misfire	• Using the scan tool, CARRY OUT the cylinder power balance and the relative compression test. REPAIR as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
	• Engine or torque converter out of balance	• VERIFY the torque converter to crankshaft pilot clearance is correct. REPAIR as necessary. RE-INDEX the torque converter on the flexplate by 120 degrees for a 3-bolt converter or 180 degrees for a 4-bolt converter. Refer to the appropriate Automatic Transmission article for the procedure. TEST the system for normal operation after the repair.
		• CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the

• Engine vibration - is felt with increases and decreases in engine rpm	• Powertrain mount(s)	appropriate Engine article for the procedure. For automatic transmission, Refer to the appropriate Automatic Transmission article for the procedure. For manual transmission, REFER to **MANUAL TRANSAXLE/TRANSMISSION** article. TEST the system for normal operation after the repair.
	• Engine or transmission grounded to chassis	• INSPECT the powertrain/drivetrain for correct clearances. REPAIR as necessary. TEST the system for normal operation after the repair.
• Engine vibration - increases intensity as the engine rpm is increased	• Engine out-of-balance	• CARRY OUT the Neutral Engine Run-Up (NERU) Test. REFER to **NOISE, VIBRATION AND HARSHNESS** article. ROTATE the torque converter, 120 degrees for 3-bolt or 180 degrees for 4-bolt. INSPECT the torque converter pilot outer diameter-to-crankshaft pilot inner diameter. REPAIR as necessary. Refer to the appropriate Automatic Transmission article for the procedure. TEST the system for normal operation after the repair.
• Engine vibration - mostly at coast/neutral coast. Condition improves with vehicle acceleration	• Combustion instability	• CHECK the ignition system. INSTALL new components as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
• Engine vibration or shudder - occurs with light to medium acceleration above 56 km/h (35 mph)	• Worn or damaged spark plugs	• INSPECT the spark plugs for cracks, high resistance or broken insulators. INSTALL a new spark plug(s) as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
	• Plugged fuel injector	• REPAIR or INSTALL a new injector as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
	• Contaminated fuel	• INSPECT the fuel for contamination. DRAIN the fuel system and refill. TEST the system for normal operation after the repair.

Component Tests

The following component tests are used to diagnose engine concerns.

Engine Oil Leaks

NOTE: If an overnight drive is done, the fan air or road air blast can cause erroneous readings.

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean the cylinder block, cylinder heads, valve covers, oil pan and flywheel with a suitable solvent to remove all traces of oil.

Engine Oil Leaks - Fluorescent Oil Additive Method

Use the 12 Volt Master UV Diagnostic Inspection Kit to carry out the following procedure for oil leak diagnosis.

1. Add 29.6 ml (1 oz) of gasoline engine oil leak detection dye to a minimum of 0.47L (1/2 qt) and a maximum of 0.95L (1 qt) engine oil and fill through the engine oil fill. Thoroughly premix the gasoline engine oil dye or it will not have enough time to reach the crankcase, oil galleries and seal surfaces during this particular 15 minute test. The additive must be mixed well with oil and added through the oil fill. Check the level on the oil level indicator to determine what amount of oil to premix. If it is in the middle of the crosshatch area or below the full mark, use 0.95L (1 qt). If it is at the full mark, use 0.47L (1/2 qt).
2. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Leak Detector Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.
3. At the end of test, make sure the oil level is within the upper and lower oil indicator marks. Remove oil as necessary if it registers above the full mark.

Leakage Points - Underhood

Examine the following areas for oil leakage:

- Valve cover gaskets
- Cylinder head gaskets
- Oil cooler, if equipped
- Oil filter adapter
- Engine front cover
- Oil filter adapter and filter body
- Oil level indicator tube connection
- Oil pressure sensor

Leakage Points - Under Engine, With Vehicle on Hoist

Examine the following areas for oil leakage:

- Oil pan gaskets
- Oil pan sealer
- Engine front cover gasket
- Crankshaft front seal
- Crankshaft rear oil seal
- Oil filter adapter and filter body
- Oil cooler, if equipped

Leakage Points - With Transmission and Flywheel Removed

Examine the following areas for oil leakage:

- Crankshaft rear oil seal
- Rear main bearing cap parting line
- Flexplate mounting bolt holes (with flexplate installed)
- Pipe plugs at the end of oil passages

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the dye method.

Compression Test

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.
2. Set the throttle plates in the wide-open position.
3. Install a compression gauge such as the Quick Disconnect Compression Tester in the No. 1 cylinder.
4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes necessary to obtain the highest reading.
5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

COMPRESSION PRESSURE LIMIT CHART

Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1,131 kPa (164 psi)	848 kPa (123 psi)	1,338 kPa (194 psi)	1,000 kPa (146 psi)	1,544 kPa (224 psi)	1,158 kPa (168 psi)
938 kPa (136 psi)	703 kPa (102 psi)	1,145 kPa (166 psi)	855 kPa (124 psi)	1,351 kPa (196 psi)	1,014 kPa (147 psi)	1,558 kPa (226 psi)	1,165 kPa (169 psi)
952 kPa (138 psi)	717 kPa (104 psi)	1,158 kPa (168 psi)	869 kPa (126 psi)	1,365 kPa (198 psi)	1,020 kPa (148 psi)	1,572 kPa (228 psi)	1,179 kPa (171 psi)
965 kPa (140 psi)	724 kPa (106 psi)	1,172 kPa (170 psi)	876 kPa (127 psi)	1,379 kPa (200 psi)	1,034 kPa (150 psi)	1,586 kPa (230 psi)	1,186 kPa (172 psi)
979 kPa (142 psi)	738 kPa (107 psi)	1,186 kPa (172 psi)	889 kPa (129 psi)	1,303 kPa (202 psi)	1,041 kPa (151 psi)	1,600 kPa (232 psi)	1,200 kPa (174 psi)
933 kPa (144 psi)	745 kPa (109 psi)	1,200 kPa (174 psi)	903 kPa (131 psi)	1,407 kPa (204 psi)	1,055 kPa (153 psi)	1,055 kPa (153 psi)	1,207 kPa (175 psi)
1,007 kPa (146 psi)	758 kPa (110 psi)	1,214 kPa (176 psi)	910 kPa (132 psi)	1,420 kPa (206 psi)	1,062 kPa (154 psi)	1,627 kPa (154 psi)	1,220 kPa (177 psi)
1,020 kPa (148 psi)	765 kPa (111 psi)	1,227 kPa (178 psi)	917 kPa (133 psi)	1,434 kPa (208 psi)	1,075 kPa (156 psi)	1,641 kPa (238 psi)	1,227 kPa (178 psi)
1,034 kPa (150 psi)	779 kPa (113 psi)	1,241 kPa (180 psi)	931 kPa (135 psi)	1,448 kPa (210 psi)	1,083 kPa (157 psi)	1,655 kPa (240 psi)	1,241 kPa (180 psi)
1,048 kPa (152 psi)	786 kPa (114 psi)	1,255 kPa (182 psi)	936 kPa (136 psi)	1,462 kPa (212 psi)	1,089 kPa (158 psi)	1,669 kPa (242 psi)	1,248 kPa (181 psi)
1,062 kPa (154 psi)	793 kPa (115 psi)	1,269 kPa (184 psi)	952 kPa (138 psi)	1,476 kPa (214 psi)	1,103 kPa (160 psi)	1,682 kPa (244 psi)	1,262 kPa (183 psi)
1,076 kPa (156 psi)	807 kPa (117 psi)	1,282 kPa (186 psi)	965 kPa (140 psi)	1,489 kPa (216 psi)	1,117 kPa (162 psi)	1,696 kPa (246 psi)	1,269 kPa (184 psi)
1,089 kPa (158 psi)	814 kPa (118 psi)	1,296 kPa (188 psi)	972 kPa (141 psi)	1,503 kPa (218 psi)	1,124 kPa (163 psi)	1,710 kPa (248 psi)	1,202 kPa (186 psi)
1,103 kPa (160 psi)	827 kPa (120 psi)	1,310 kPa (190 psi)	979 kPa (142 psi)	1,517 kPa (220 psi)	1,138 kPa (165 psi)	1,724 kPa (250 psi)	1,289 kPa (187 psi)
1,110 kPa (161 psi)	834 kPa (121 psi)	1,324 kPa (192 psi)	993 kPa (144 psi)	1,631 kPa (222 psi)	1,145 kPa (166 psi)	-	-

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil meeting Ford specification on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are worn or damaged.
2. If compression does not improve, valves are sticking or not seating correctly.
3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.

Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Cylinder Leakage Detection

When a cylinder produces a low reading, use of the Engine Cylinder Leak Detection/Air Pressurization Kit will be helpful in pinpointing the exact cause.

The leakage detector is inserted in the spark plug hole, the piston is brought up to Top Dead Center (TDC) on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, a special gauge included in the kit will read the percentage of leakage. Leakage exceeding 20% is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve will be heard in the Throttle Body (TB). A leak at the exhaust valve can be heard at the tailpipe. Leakage past the piston rings will be audible at the PCV connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator.

Excessive Engine Oil Consumption

Nearly all engines consume oil, which is essential for normal lubrication of the cylinder bore walls and pistons and rings. Determining the level of oil consumption may require testing by recording how much oil is being added over a given set of miles.

Customer driving habits greatly influence oil consumption. Mileage accumulated during towing or heavy loading generates extra heat. Frequent short trips, stop-and-go type traffic or extensive idling, prevent the engine from reaching normal operating temperature. This prevents component clearances from reaching specified operating ranges.

The following diagnostic procedure may be utilized to determine internal oil consumption. Make sure that the concern is related to internal oil consumption, and not external leakage, which also consumes oil. Verify there are no leaks before carrying out the test. Once verified, the rate of internal oil consumption can be tested.

A new engine may require extra oil in the early stages of operation. Internal piston-to-bore clearances and sealing characteristics improve as the engine breaks in. Engines are designed for close tolerances and do not require break-in oils or additives. Use the oil specified in the Owner's Literature. Ambient temperatures may determine the oil viscosity specification. Verify that the correct oil is being used for the vehicle in the geographic region in which it is driven.

Basic Pre-checks

1. For persistent complaints of oil consumption, interview the customer to determine the oil consumption characteristics. If possible, determine the brand and grade of oil currently in the oil pan. Look at the oil filter or oil-change station tags to determine if Ford-recommended maintenance schedules have been followed. Make sure that the oil has been changed at the specified mileage intervals. If vehicle mileage is

past the first recommended drain interval, the OEM production filter should have been changed.

2. Ask how the most current mileage was accumulated. That is, determine whether the vehicle was driven under the following conditions:
   - Extended idling or curbside engine operation
   - Stop-and-go traffic or taxi operation
   - Towing a trailer or vehicle loaded heavily
   - Frequent short trips (engine not up to normal operating temperature)
   - Excessive throttling or high engine-rpm driving
3. Verify that there are no external leaks. If necessary, review the diagnostic procedure under **Engine Oil Leaks**.
4. Inspect the crankcase ventilation system for:
   - disconnected hoses at the valve cover or TB.
   - loose or missing valve cover fill cap.
   - missing or incorrectly seated engine oil level indicator.
   - incorrect or dirty PCV valve.
   - a PCV valve grommet unseated in the valve cover (if so equipped).
5. Inspect for signs of sludge. Sludge affects PCV performance and can plug or restrict cylinder head drainback wells. It can also increase oil pressure by restricting passages and reducing the drainback capability of piston oil control rings. Sludge can result from either excessive water ingestion in the crankcase or operation at extremely high crankcase temperatures.
6. Inspect the air filter for dirt, sludge or damage. A hole in the filter element will allow unfiltered air to bypass into the air induction system. This can cause premature internal wear (engine dusting), allowing oil to escape past rings, pistons, valves and guides.
7. If the engine is hot or was recently shut down, wait at least 5 minutes to allow the oil to drain back. Ask the customer if this requirement has been followed. Adding oil without this wait period can cause an overfill condition, leading to excessive oil consumption and foaming which may cause engine damage.
8. Make sure the oil level indicator (dipstick) is correctly and fully seated in the indicator tube. Remove the oil level indicator and record the oil level.

Detailed Pre-checks

1. Check the thermostat opening temperature to make sure that the cooling system is operating at the specified temperature. If it is low, internal engine parts are not running at specified internal operating clearances.
2. Verify the spark plugs are not oil saturated. Oil leaking into one or more cylinders will appear as an oil soaked condition on the plug. If a plug is saturated, a compression check may be necessary at the conclusion of the oil consumption test.

Oil Consumption Test

Once all of the previous conditions are met, carry out an oil consumption test.

1. Drain the engine oil and remove the oil filter. Install a new manufacturer-specified oil filter. Make sure

the vehicle is positioned on a level surface. Refill the oil pan to a level **one liter (quart) less** than the specified fill level, using manufacturer-specified oil.

2. Run the engine for 3 minutes (if hot) or 10 minutes (if cold). Allow for a minimum 5-minute drainback period and then record the oil level shown on the oil level indicator. Place a mark on the backside of the oil level indicator noting the oil level location.
3. Add the final one liter (quart) to complete the normal oil fill. Restart the engine and allow it to idle for 2 minutes. Shut the engine down.
4. After a 5-minute drainback period, record the location of the oil level again. Mark the oil level indicator with the new oil level location. (Note: Both marks should be very close to the MIN-MAX upper and lower limits or the upper and lower holes on the oil level indicator. These marks will exactly measure the engine's use of oil, with a one liter (quart) differential between the new marks.) Demonstrate to the customer that the factory-calibrated marks on the oil level indicator are where the oil should fall after an oil change with the specified fill amount. Explain however, that this may vary slightly between MIN-MAX or the upper and lower holes on the oil level indicator.
5. Record the vehicle mileage.
6. Advise the customer that oil level indicator readings must be taken every 320 km (200 mi) or weekly, using the revised marks as drawn. Remind the customer that the engine needs a minimum 5-minute drainback for an accurate reading and that the oil level indicator must be firmly seated in the tube prior to taking the reading.
7. When the subsequent indicator readings demonstrate a full liter (quart) has been used, record the vehicle mileage. The mileage driven between the 2 readings should not be less than 1,500 miles. The drive cycle the vehicle has been operated under must be considered when making this calculation. It may be necessary to have the customer bring the vehicle in for a periodic oil level indicator reading to closely monitor oil usage.

Post Checks, Evaluation and Corrective Action

1. If test results indicate excessive oil consumption, carry out a cylinder compression test. The cylinder compression test should be carried out with a fully charged battery and all spark plugs removed. See the **Compression Test** for pressure range limits.
2. Compression should be consistent across all cylinders. Refer to the **Compression Test**. If compression tested within the **SPECIFICATIONS**, the excessive oil consumption may be due to wear on the valve guides, valves or valve seals.
3. A cylinder leak detection test can be carried out using an Engine Cylinder Leak Detection/Air Pressurization Kit. This can help identify valves, piston rings, or worn valve guides/valve stems, inoperative valve stem seals or other related areas as the source of oil consumption.

NOTE: **An oil-soaked appearance on the porcelain tips of the spark plugs also indicates excessive oil use. A typical engine with normal oil consumption will exhibit a light tan to brown appearance. See Spark Plug Inspection for details. A single or adjoining, multiple cylinder leak can be traced by viewing the tips.**

4. If an internal engine part is isolated as the root cause, determine if the repair will exceed cost limits and proceed with a repair strategy as required.

5. Once corrective action to engine is complete and verifying that all pre-check items were eliminated in the original diagnosis, repeat the Oil Consumption Test as described above and verify consumption results.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is conducted. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.

Intake Manifold Vacuum Test - Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

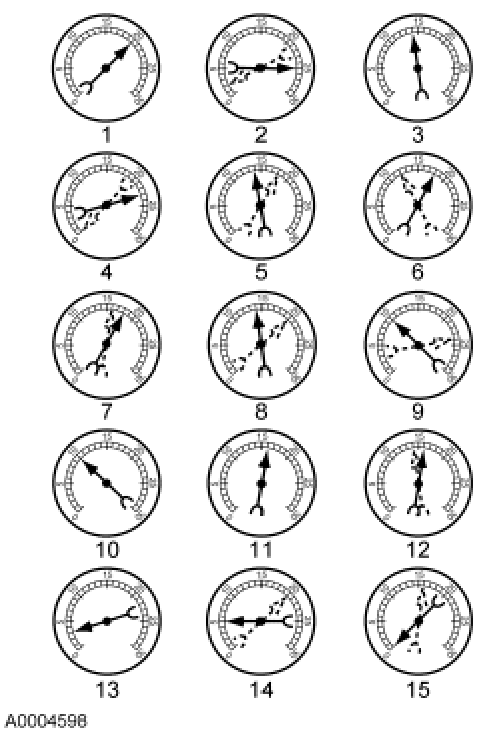

Fig. 1: Potential Vacuum Gauge Readings Chart
Courtesy of FORD MOTOR CO.

1. NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.
2. NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.
3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP: The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.
4. WORN RINGS OR DILUTED OIL: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).
5. STICKING VALVES: When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.
6. BURNED OR WARPED VALVES: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient valve clearance will also cause this reaction.
7. POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.
8. WORN VALVE GUIDES: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.
9. WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.
10. LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.
11. IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady but somewhat low reading.
12. INSUFFICIENT SPARK PLUG GAP: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.
13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.
14. BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.
15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler, kinked tailpipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.
16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster, the unit will not function correctly. Always fix vacuum leaks.

Oil Pressure Test

1. Disconnect and remove the oil pressure sensor from the engine.
2. Connect the Oil Pressure Gauge to the oil pressure sender oil galley port.
3. Run the engine until normal operating temperature is reached.
4. Run the engine at the specified rpm and record the gauge reading.

5. The oil pressure should be within specifications; for additional information, refer to the **SPECIFICATIONS**.
6. If the pressure is not within specification, check the following possible sources:
    - Insufficient oil
    - Oil leakage
    - Worn or damaged oil pump
    - Oil pump screen cover and tube
    - Excessive main bearing clearance
    - Excessive connecting rod bearing clearance
    - Chain tensioner leak

Valve Train Analysis

The following component tests are used to diagnose valve train concerns.

Valve Train Analysis - Engine Off, Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis - Camshafts

- Check for broken or damaged parts.
- Check for loose mounting bolts on camshaft caps.

Valve Train Analysis - Camshaft Roller Followers and Hydraulic Lash Adjusters - 3.0L Engine

- Check for broken or damaged parts.
- Check for incorrectly installed roller followers.
- Check for collapsed hydraulic lash adjusters.

Valve Train Analysis - Valve Tappet - 2.3L and 3.5L Engines

- Check for valve tappet face wear.
- Check for excessive valve tappet clearance. Refer to Valve Clearance Check. For the 2.3L engine, refer to **ENGINE - 2.3L** article. For the 3.5L engine, refer to **ENGINE - 3.5L** article.

Valve Train Analysis - Valve Springs, Valve Spring Retainers and Valve Spring Retainer Keys

NOTE: Valve tappers must be removed on 2.3L and 3.5L engines.

- Check for broken or damaged parts.
- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

Valve Train Analysis - Valves and Cylinder Head

NOTE: Valve tappets must be removed on 2.3L and 3.5L engines.

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check for damaged hydraulic lash adjuster.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

Valve Train Analysis - Camshaft Lobe Lift

Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the spark plugs.
2. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of the dial indicator is on top of the camshaft lobe and on the same plane as the valve tappet (2.3L and 3.5L) or hydraulic lash adjuster (3.0L).
3. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

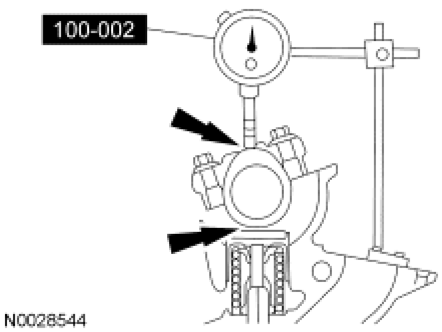

Fig. 2: Checking Camshaft Lobe Lift
Courtesy of FORD MOTOR CO.

4. Zero the dial indicator. Continue to rotate the crankshaft until the high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).
5. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat Steps 1 through 6.
6. If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers.
7. Install the spark plugs.

GENERAL PROCEDURES

SPROCKETS

1. Inspect the sprockets for cracks and worn or chipped teeth.

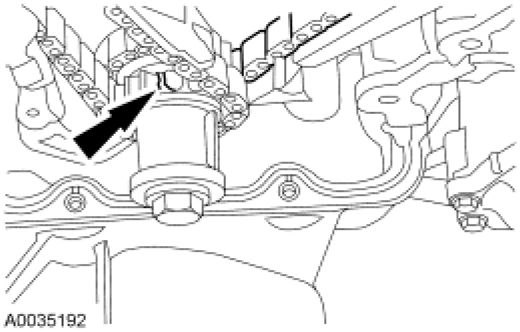

Fig. 3: Inspecting Sprockets For Damage
Courtesy of FORD MOTOR CO.

CAMSHAFT BEARING JOURNAL DIAMETER

NOTE: Refer to the SPECIFICATIONS.

1. Measure each camshaft journal diameter in 2 directions.

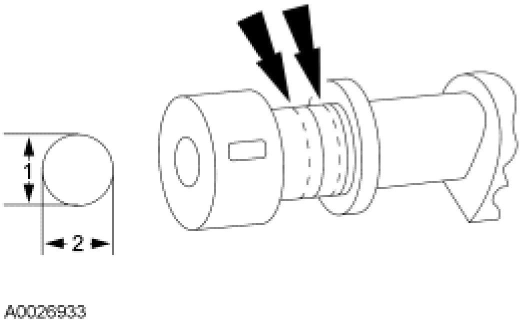

Fig. 4: Locating Areas For Measuring Camshaft Journal Diameter
Courtesy of FORD MOTOR CO.

CAMSHAFT JOURNAL TO BEARING CLEARANCE - OHC ENGINES

NOTE: Refer to the SPECIFICATIONS.

NOTE: The camshaft journals must meet specifications before checking camshaft journal clearance.

1. Measure each camshaft bearing in 2 directions.

- Subtract the camshaft journal diameter from the camshaft bearing diameter.

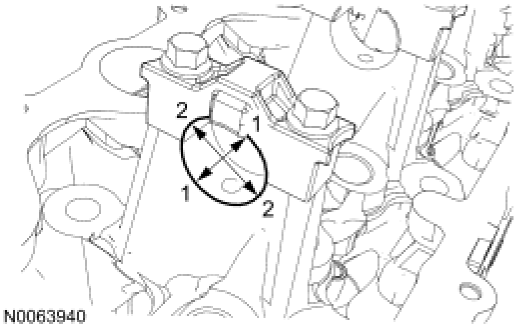

Fig. 5: Measuring Camshaft Bearing In 2 Directions
Courtesy of FORD MOTOR CO.

CAMSHAFT END PLAY - OHC ENGINES

Special Tools

Illustration	Tool Name	Tool Number
	Dial Indicator Gauge with Holding Fixture	100-002 (TOOL-4201-C) or equivalent

NOTE: **Refer to the SPECIFICATIONS.**

1. Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft end play.
2. Position the camshaft to the rear of the cylinder head.
3. Zero the Dial Indicator Gauge.
4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play.
   - If camshaft end play exceeds specifications, install a new camshaft and recheck end play.
   - If camshaft end play exceeds specification after camshaft installation, install a new cylinder head.

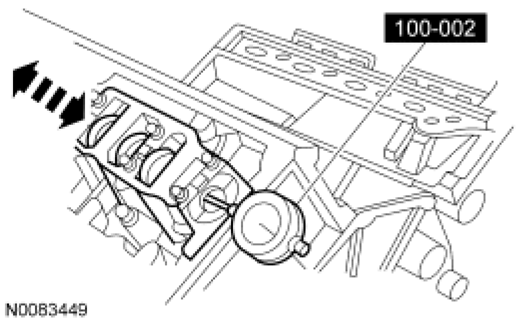

Fig. 6: Recording Camshaft End Play

Courtesy of FORD MOTOR CO.

CAMSHAFT SURFACE INSPECTION

1. Inspect camshaft lobes for pitting or damage in the contact area. Minor pitting is acceptable outside the contact area.

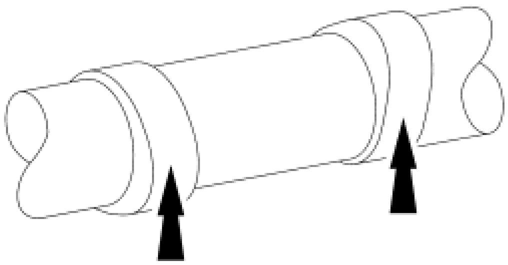

Fig. 7: Inspecting Camshaft Lobes
Courtesy of FORD MOTOR CO.

CAMSHAFT LOBE LIFT

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Dial Indicator Gauge with Holding Fixture	100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the SPECIFICATIONS.

1. Use the Dial Indicator Gauge with Holding Fixture to measure camshaft intake/exhaust lobe lift.
   - Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading to figure the camshaft lobe lift.

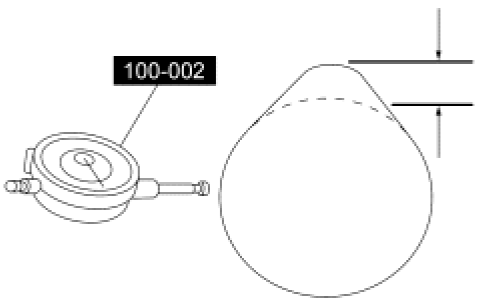

Fig. 8: Using Dial Indicator Gauge
Courtesy of FORD MOTOR CO.

CAMSHAFT RUNOUT

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Dial Indicator Gauge with Holding Fixture	100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the SPECIFICATIONS.

NOTE: Camshaft journals must be within specifications before checking runout.

1. Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft runout.
   - Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading.

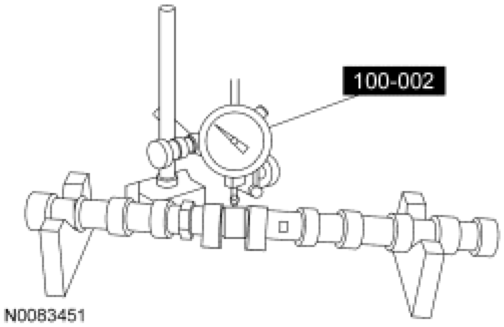

Fig. 9: Using Dial Indicator Gauge
Courtesy of FORD MOTOR CO.

CRANKSHAFT END PLAY

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Dial Indicator Gauge with Holding Fixture	100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the SPECIFICATIONS.

1. Install the Dial Indicator Gauge with Holding Fixture.
2. Position the crankshaft to the rear of the cylinder block.
3. Zero the Dial Indicator Gauge.
4. Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

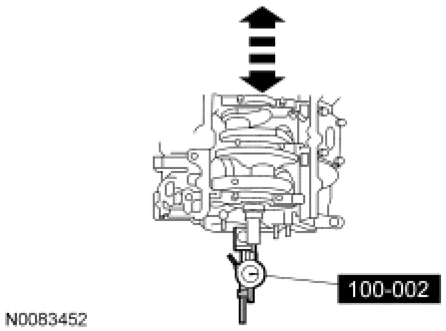

Fig. 10: Recording Crankshaft End Play
Courtesy of FORD MOTOR CO.

VALVE STEM DIAMETER

NOTE: **Refer to the SPECIFICATIONS.**

1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.

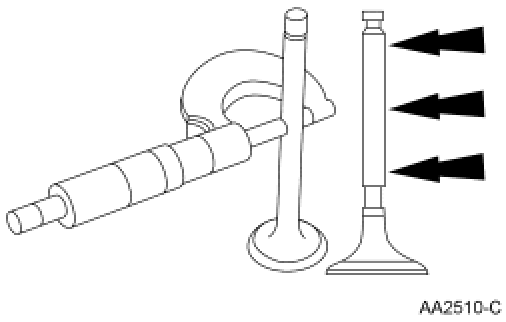

Fig. 11: Measuring Diameter Of Valve Stem
Courtesy of FORD MOTOR CO.

VALVE INSPECTION

1. Inspect the following valve areas:
    1. The end of the stem for grooves or scoring.
    2. The valve face and the edge for pits, grooves or scores.
    3. The valve head for signs of burning, erosion, warpage and cracking.
    4. The valve margin for wear.

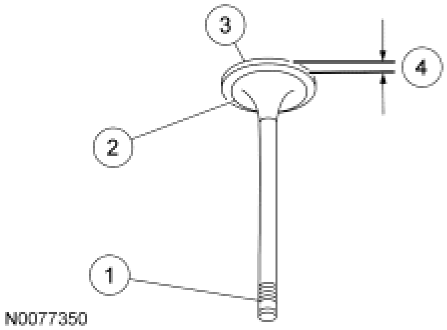

Fig. 12: Inspecting Valves
Courtesy of FORD MOTOR CO.

VALVE GUIDE INNER DIAMETER

NOTE: Refer to the SPECIFICATIONS.

NOTE: Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide, if necessary.

1. Use a ball gauge to determine the inside diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.

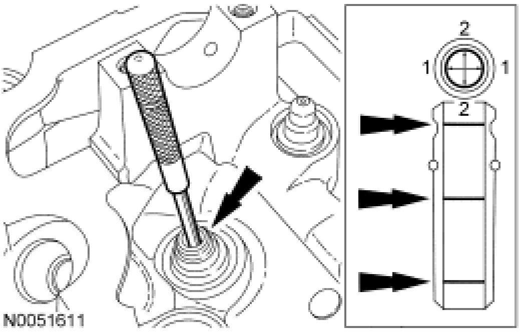

Fig. 13: Measuring Valve Guide Inner Diameter
Courtesy of FORD MOTOR CO.

2. Measure the ball gauge with a micrometer.

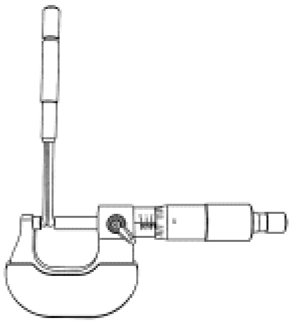

Fig. 14: Measuring Ball Gauge With Micrometer
Courtesy of FORD MOTOR CO.

3. If the valve guide is not within specifications, install a new cylinder head assembly.

VALVE STEM TO VALVE GUIDE CLEARANCE

Special Tools

Illustration	Tool Name	Tool Number
	Clearance Gauge, Valve Guide	303-004 (TOOL-6505-E) or equivalent
	Dial Indicator Gauge with Holding Fixture	100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the SPECIFICATIONS.

NOTE: The valve stem diameter must be within specifications before checking valve stem-to-valve guide clearance.

NOTE: If necessary, use a magnetic base.

1. Install a Valve Guide Clearance Gauge on the valve stem and install a Dial Indicator Gauge with Holding Fixture. Lower the valve until the clearance gauge contacts the upper surface of the valve guide.

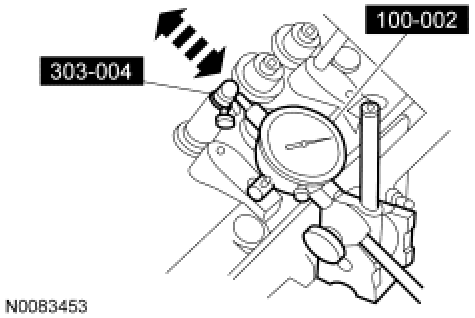

Fig. 15: Installing Valve Guide Clearance Gauge
Courtesy of FORD MOTOR CO.

2. Move the Valve Guide Clearance Gauge toward the Dial Indicator Gauge with Holding Fixture and zero the Dial Indicator Gauge. Move the Valve Guide Clearance Gauge away from the Dial Indicator Gauge with Holding Fixture and note the reading. The reading will be DOUBLE the valve stem-to-valve guide clearance.

VALVE SPRING INSTALLED LENGTH

NOTE: Refer to the SPECIFICATIONS.

1. Measure the installed length of each valve spring.

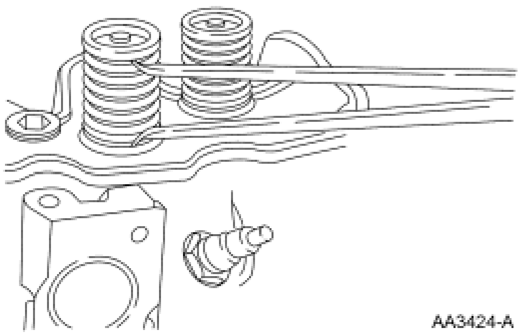

Fig. 16: Measuring Installed Length Of Valve Spring
Courtesy of FORD MOTOR CO.

VALVE SPRING FREE LENGTH

NOTE: Refer to the SPECIFICATIONS.

1. Measure the free length of each valve spring.

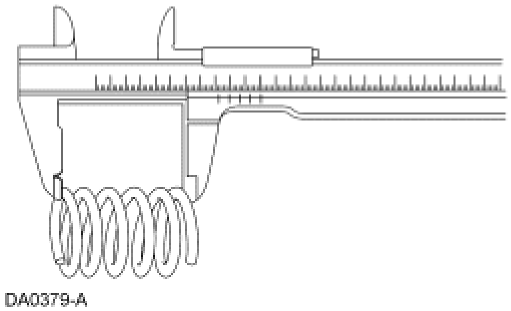

Fig. 17: Measuring Free Length Of Valve Spring
Courtesy of FORD MOTOR CO.

VALVE SPRING SQUARENESS

1. Measure the out-of-square on each valve spring.
    - Turn the valve spring and observe the space between the top of the valve spring and the square.

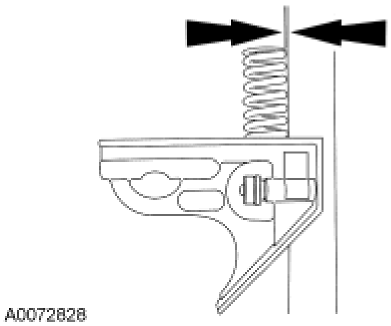

Fig. 18: Measuring Valve Spring Out-Of-Square
Courtesy of FORD MOTOR CO.

VALVE SPRING STRENGTH

Special Tools

Illustration	Tool Name	Tool Number
	Pressure Gauge, Valve/Clutch Spring	303-006 (TOOL-6513-DD) or equivalent

NOTE: **Refer to the SPECIFICATIONS.**

1. Use the Valve/Clutch Spring Pressure Gauge to check the valve spring for correct strength at the specified valve spring length.

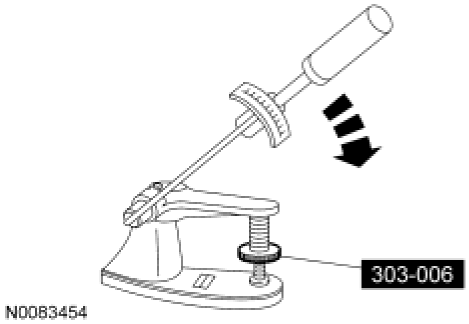

Fig. 19: Using Valve/Clutch Spring Pressure Gauge
Courtesy of FORD MOTOR CO.

VALVE SEAT INSPECTION

Valve and Seat Refacing Measurements

NOTE: Refer to the SPECIFICATIONS.

NOTE: After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.
    - Check valve angles.
    - Check margin width.
    - Be sure margin width is within specification.

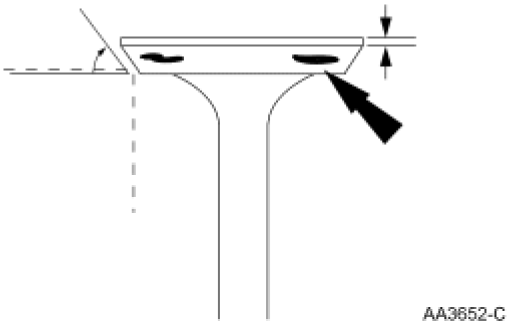

Fig. 20: Checking Valve Head And Seat
Courtesy of FORD MOTOR CO.

2. Inspect for abnormalities on the valve face and seat. Install a new cylinder head assembly if abnormalities are found.

VALVE SEAT WIDTH

NOTE: Refer to the SPECIFICATIONS.

1. Measure the valve seat width. If necessary, grind the valve seat to specification.
    - Measure the intake valve seat width.
    - Measure the exhaust valve seat width.
    - Recheck the valve spring installed length after the seats have been ground, and shim the valve springs as necessary to achieve the correct installed spring length.

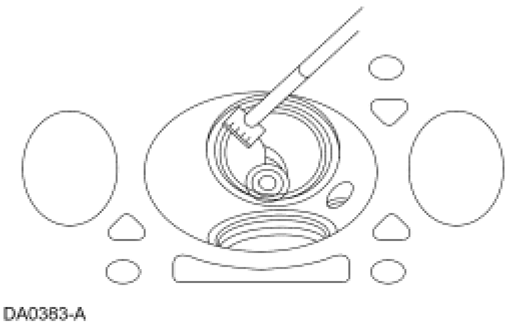

Fig. 21: Measuring Valve Seat Width
Courtesy of FORD MOTOR CO.

VALVE SEAT RUNOUT

NOTE: Refer to the SPECIFICATIONS.

1. Use a valve seat runout gauge to check valve seat runout.

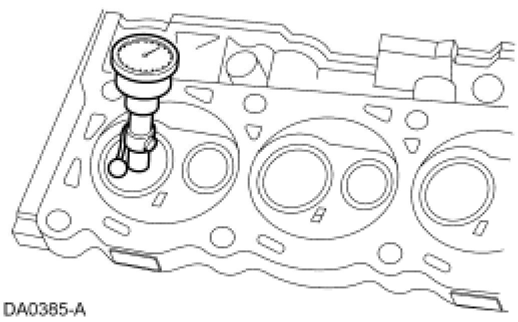

Fig. 22: Measuring Valve Seat Runout
Courtesy of FORD MOTOR CO.

FLEXPLATE INSPECTION

1. Inspect the flexplate for:
    1. any cracks.
    2. worn ring gear teeth.
    3. chipped or cracked ring gear teeth.

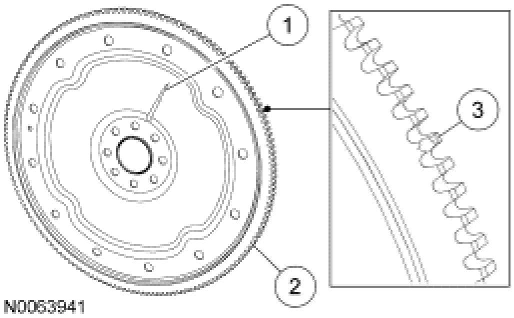

Fig. 23: Inspecting Flexplate
Courtesy of FORD MOTOR CO.

FLYWHEEL INSPECTION

NOTE: The flywheel cannot be resurfaced, it must be replaced.

1. Inspect the flywheel for:
    1. any cracks.
    2. worn ring gear teeth.
    3. chipped or cracked ring gear teeth.
    4. scratches, nicks and discoloration.

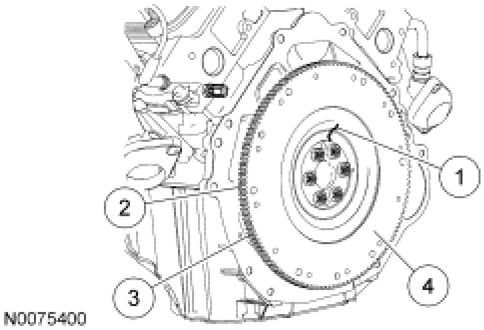

Fig. 24: Inspecting Flywheel For Damages
Courtesy of FORD MOTOR CO.

CYLINDER HEAD DISTORTION

Special Tools

Illustration	Tool Name	Tool Number
	Feeler Gauge Set	303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the SPECIFICATIONS.

NOTE: Make sure all cylinder head surfaces are clear of any gasket material, silicone sealant, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

1. Using a Straightedge and a Feeler Gauge Set, inspect the cylinder head for flatness in the sequence shown.

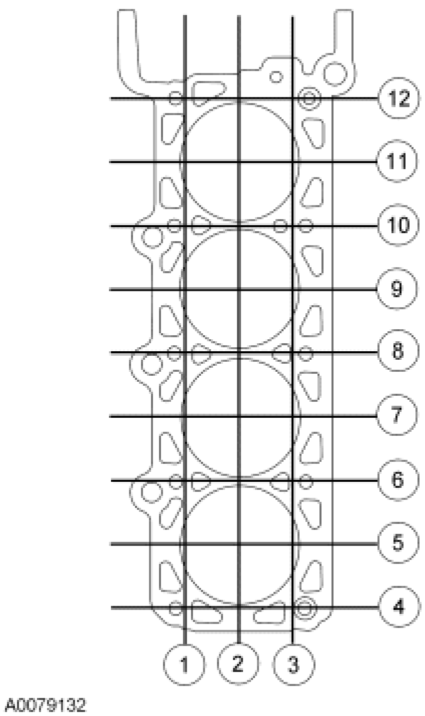

Fig. 25: Inspecting Cylinder Head For Flatness
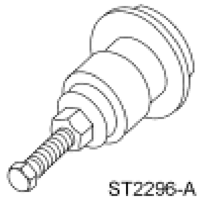
Courtesy of FORD MOTOR CO.

CYLINDER BLOCK DISTORTION

Special Tools

Illustration	Tool Name	Tool Number
	Feeler Gauge Set	303-D027 (D81L-4201-A) or equivalent



NOTE: Refer to the SPECIFICATIONS.

NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

1. Use a Straightedge and a Feeler Gauge Set to inspect the cylinder block for flatness.

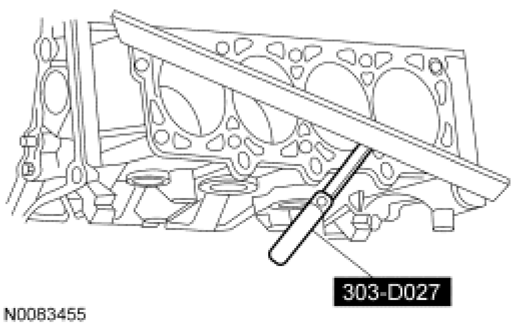


Fig. 26: Inspecting Cylinder Block
Courtesy of FORD MOTOR CO.

EXHAUST MANIFOLD CLEANING AND INSPECTION

Special Tools

Illustration	Tool Name	Tool Number
	Feeler Gauge Set	303-D027 (D81L-4201-A) or equivalent

1. Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.

NOTE: New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

2. Using the Straightedge and a Feeler Gauge Set, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 in), install a new exhaust manifold.

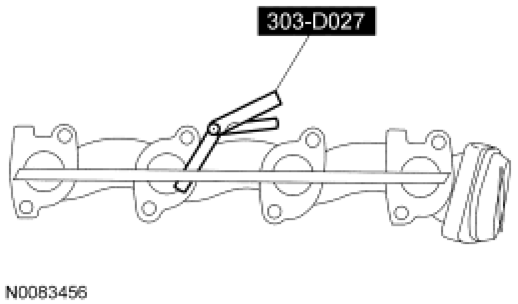

Fig. 27: Checking Exhaust Manifold Sealing Surface For Warpage
Courtesy of FORD MOTOR CO.

CORE PLUG REPLACEMENT

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	Slide Hammer	100-001 (T50T-100-A)

Material

Item	Specification
LOCTITE® Retaining Compound 620 High Temperature Loctite 620/Permatex 62050	WSK-N2G349-A9
Threadlock 262 TA-26	WSK-M2G351-A6

NOTE: It is necessary to use Loctite® Retaining Compound 620 High Temperature sealant on all 3 valve modular engine cylinder head cup plugs. If not used, the cylinder head cup plugs could leak or seep, causing serious engine damage.

All core plugs

NOTE: Cylinder block core plug shown, cylinder head core plug similar.

1. Use the Slide Hammer or a suitable tool to remove the core plug.

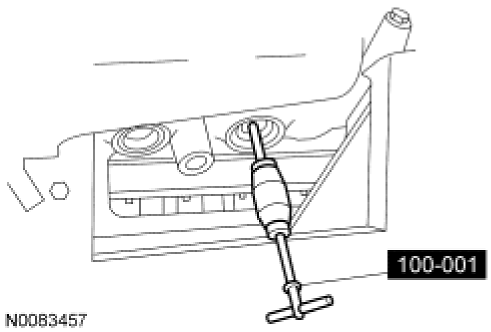

Fig. 28: Identifying Cylinder Block Core Plug
Courtesy of FORD MOTOR CO.

NOTE: Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

2. Inspect the core plug bore for any damage that would interfere with the correct sealing of the plug. If the core plug bore is damaged, bore for the next oversize plug.

Cup-type

NOTE: Use care during this procedure so as not to disturb or distort the cup sealing surface.

NOTE: When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.

3. Coat the cup-type core plug and bore lightly with sealant and install the core plug.
   - Use a suitable tool to seat the cup-type core plug.

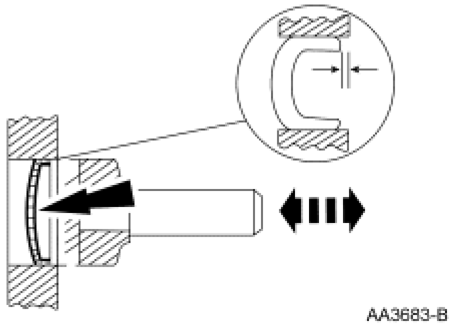

Fig. 29: Seating Cup-Type Cylinder Block Core Plug
Courtesy of FORD MOTOR CO.

Expansion-type

NOTE: Do not contact the crown when installing an expansion-type core plug. This could expand the plug before seating and result in leakage.

4. Coat the expansion-type core plug and bore lightly with sealant and install the core plug.
    - Use a suitable tool to seat the expansion-type core plug.

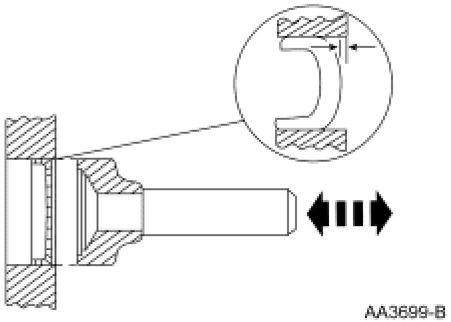

Fig. 30: Seating Cup-Type Cylinder Block Core Plug
Courtesy of FORD MOTOR CO.

SPARK PLUG INSPECTION

1. Inspect the spark plug for a bridged gap.
    - Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.
    - Install a new spark plug.

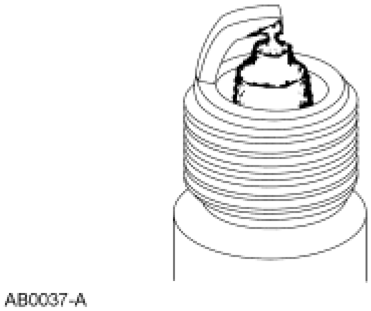

Fig. 31: Identifying Spark Plug With Bridged Gap
Courtesy of FORD MOTOR CO.

2. Check for oil fouling.
    - Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
    - Correct the oil leak concern.

- Install a new spark plug.

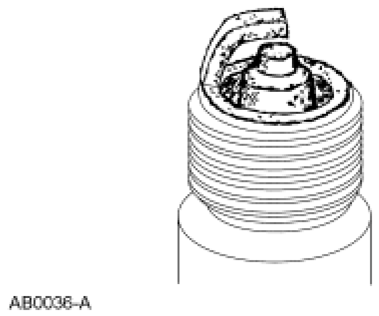

Fig. 32: Identifying Oil Fouled Spark Plug
Courtesy of FORD MOTOR CO.

3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
    - Install new spark plugs.

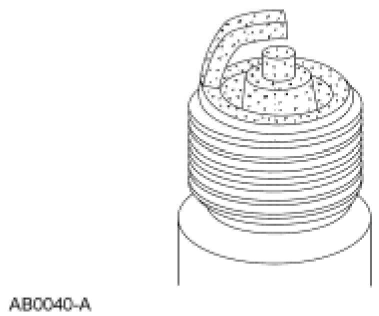

Fig. 33: Identifying Spark Plug Carbon Fouling
Courtesy of FORD MOTOR CO.

4. Inspect for normal burning.
    - Check for light tan or gray deposits on the firing tip.

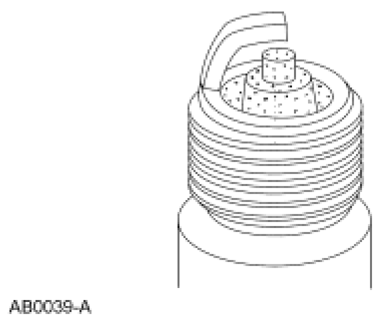

Fig. 34: Identifying Normal Burning Spark Plug

Courtesy of FORD MOTOR CO.

5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a heli-coil insert in place of the spark plug threads.
    - Install a new spark plug.

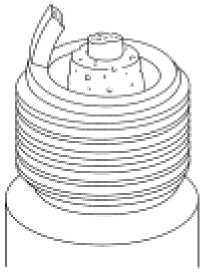

Fig. 35: Identifying Spark Plug With Pre-Ignition Condition
Courtesy of FORD MOTOR CO.

6. Inspect for overheating, identified by white or light gray spots and with a bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.
    - Install a new spark plug.

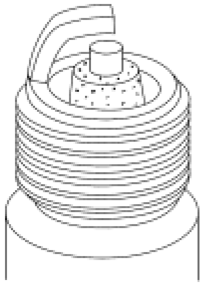

Fig. 36: Identifying Overheated Spark Plug
Courtesy of FORD MOTOR CO.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.
    - Install new spark plugs.

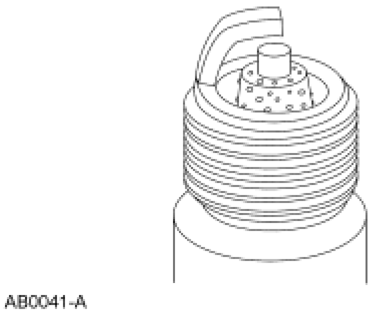

Fig. 37: Identifying Spark Plug With Fused Deposits
Courtesy of FORD MOTOR CO.

VALVE TAPPET INSPECTION

1. Inspect the valve tappet for damage, especially in the indicated areas. If any damage is evident, inspect the camshaft lobes and valves for damage. Install new components as necessary.

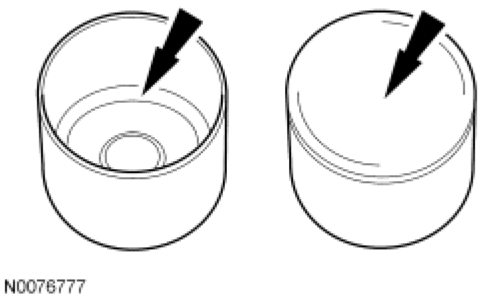

Fig. 38: Inspecting Valve Tappet
Courtesy of FORD MOTOR CO.

ROLLER FOLLOWER INSPECTION

1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.

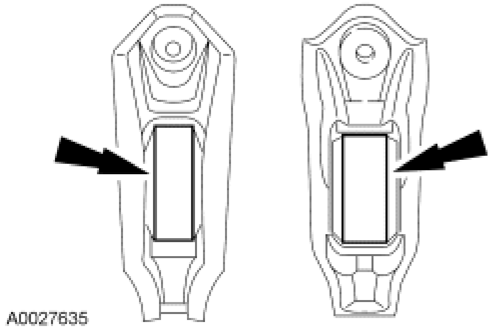

Fig. 39: Inspecting Roller Follower For Flat Spots/Scoring
Courtesy of FORD MOTOR CO.

HYDRAULIC LASH ADJUSTER INSPECTION

1. Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage.

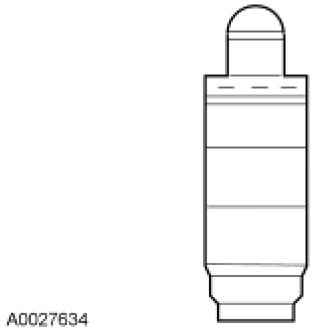

Fig. 40: Identifying Roller Follower/Valve Tappet
Courtesy of FORD MOTOR CO.

POWERTRAIN/DRIVETRAIN MOUNT NEUTRALIZING

NOTE: Refer to the appropriate part and procedure for special instructions on loosening and tightening mount fasteners.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
3. Lower the vehicle.

NOTE: Do not twist or strain the powertrain/drivetrain mounts or damage to the mounts may occur.

4. Start the vehicle and move it in forward 0.6-1.2 m (2-4 ft). Then move the vehicle in reverse the same distance.
5. Raise and support the vehicle.
6. Tighten the powertrain/drivetrain mount fasteners.
7. Lower the vehicle.
8. Test the system for normal operation.

2008 ENGINE PERFORMANCE

Evaporative Emissions - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Evaporative Emission (EVAP) canister bolts	6	-	53
EVAP canister nuts	6	-	53
Fuel tank filler pipe heat shield nuts	10	-	89
Fuel tank filler pipe hose clamp	4	-	35
Fuel tank strap bolts	40	30	-

DESCRIPTION AND OPERATION

EVAPORATIVE EMISSIONS

NOTE: **The vehicle emission vacuum routing diagrams are contained in the Description and Operation subsection of the Engine Emissions Control section. Refer to the appropriate Section 303-08.**

The Evaporative Emission (EVAP) system consists of the:

- EVAP canister purge valve.
- EVAP canister (includes the dust separator and the vent solenoid).
- fuel vapor tube assembly (includes the Fuel Tank Pressure (FTP) sensor).
- fuel tank filler cap.

The EVAP system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister, that are generated during vehicle operation or hot soak, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the PCM which, using various sensor inputs, calculates the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the vapor tube.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor vent valve.

- to the EVAP canisters through a vapor tube.
- from the EVAP canister to the engine when the EVAP canister purge valve is opened by the PCM.

The FTP sensor (part of fuel vapor tube assembly):

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBD II leak test.

The fuel vapor tube assembly:

- is located under the rear of the vehicle.
- is used to monitor fuel pressure and relay information to the PCM.
- includes the FTP sensor.

The EVAP canister:

- is located under the rear of the vehicle.
- includes the dust separator and vent solenoid.
- contains activated carbon.
- stores fuel vapors.

The fuel tank filler cap:

- relieves system vacuum below -3.5 kPa (-16.00 in H_2O).

The EVAP canister vent solenoid:

- is normally open.
- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBD II leak and pressure tests.
- is serviced as part of the EVAP canister.

The EVAP canister purge valve:

- is normally closed.
- regulates the purging of the EVAP canisters.
- is controlled by the PCM.
- is repaired as a separate item.
- is mounted on the cowl.

The dust separator:

- is attached to the EVAP canister vent solenoid.

- prevents suspended dust and dirt particles from entering the EVAP system.
- is serviced as part of the EVAP canister.

The EVAP system monitor:

- is a self-test strategy within the PCM which tests the integrity of the EVAP system.
- monitors the EVAP system for leaks.
- monitors electronic EVAP components for irrationally high or low voltages.
- monitors for correct EVAP system operation.
- uses negative and positive leak test methods to test and activate the EVAP system.

The engine ON EVAP leak-check monitor:

- is executed by the individual components of the enhanced EVAP system. Intake manifold vacuum is utilized to reach a target vacuum on the EVAP system. The FTP sensor is used by the engine ON EVAP leak-check monitor to determine if the target vacuum necessary to carry out the leak-check on the EVAP system has been reached. Once target vacuum on the EVAP system is achieved, the change in EVAP system vacuum over a calibrated period of time determines if a leak exists.

The Engine Off Natural Vacuum (EONV) EVAP leak-check monitor is executed:

- once the engine ON EVAP leak-check monitor is completed and the key is turned OFF. The EONV EVAP leak-check monitor determines if a leak is present when the naturally occurring change in the fuel tank pressure or vacuum does not exceed a calibrated limit during a calibrated amount of time. A separate, low-power consuming microprocessor in the PCM manages the Engine Off Natural Vacuum (EONV) leak-check. The engine OFF EVAP leak-check monitor is executed by the individual components of the enhanced EVAP system.

DIAGNOSTIC TESTS

EVAPORATIVE EMISSIONS

Refer to the **Introduction - Gasoline Engines** article.

GENERAL PROCEDURES

EVAPORATIVE EMISSION SYSTEM LEAK TEST

Special Tools

Illustration	Tool Name	Tool Number
	VACUTEC Smoke Machine Fuel Evaporative Emission System Tester	218-0002 or equivalent

 ST2574-A		
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Phase 1 - Leak Verification

1. Run the EVAP Test with the scan tool.

NOTE: Some small leaks may not be detected using the EVAP Test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.

2. If the Evaporative Emission (EVAP) system failed the EVAP Test, then proceed to Phase 2.

Phase 2 - System Leak Check

1. Disconnect the upper vapor tube-to-EVAP canister purge valve quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
2. Connect the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to the upper EVAP canister purge valve fitting. For additional information, refer to the manufacturer's instructions.

NOTE: The battery ground cable was previously disconnected in the vapor tube quick connect coupling procedure.

3. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

NOTE: In the scan tool, the EVAP canister purge valve is referred to as the EVAP vapor management valve.

4. Open the EVAP canister purge valve with the scan tool.
5. Close the canister vent solenoid with the scan tool.
6. Carefully turn the fuel tank filler cap counterclockwise until the thread disengages and position aside.

NOTE: If smoke does not exit the fuel tank filler pipe neck area after the system is pressurized, open the canister vent solenoid with the scan tool to allow the air to purge. Once smoke is seen at the canister vent solenoid, close the canister vent solenoid with the scan tool.

7. Introduce smoke from the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.
8. Install the fuel tank filler cap once smoke is observed exiting the fuel tank filler pipe neck area.
9. Continue to enter smoke into the system for 60 seconds to obtain pressure.
10. Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.
11. Use the halogen light provided with the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).
12. Repair any leaks as necessary.
13. Repeat the leak test until the system passes.

REMOVAL AND INSTALLATION

EVAPORATIVE EMISSION CANISTER PURGE VALVE

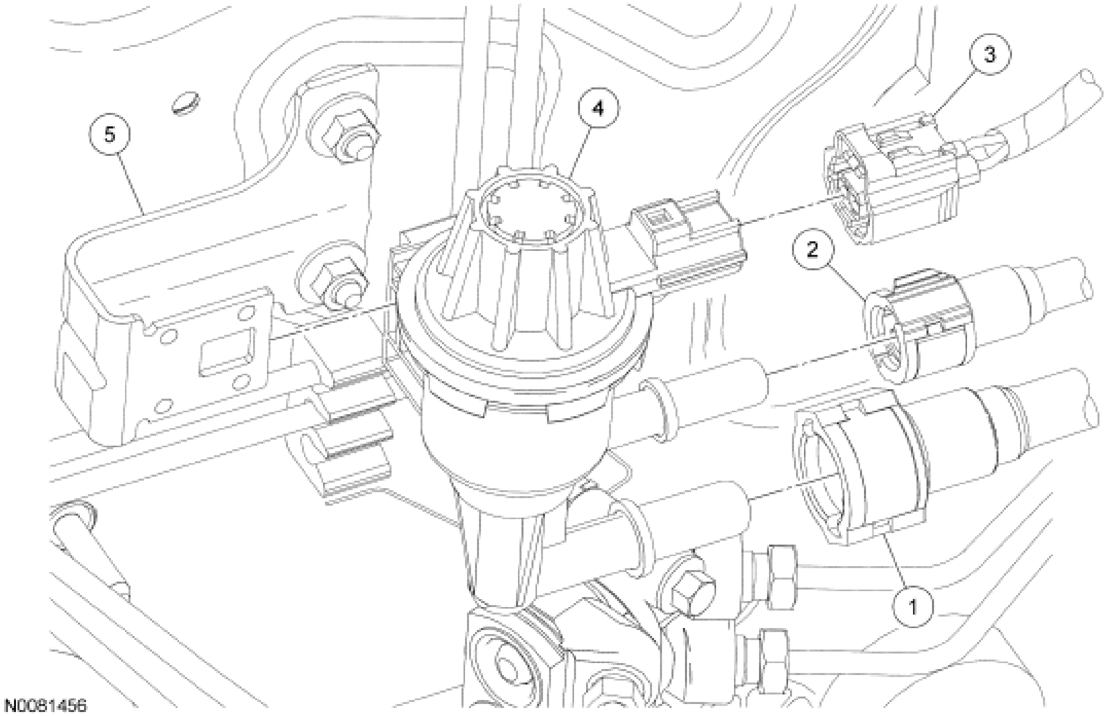

Fig. 1: Exploded View Of Evaporative Emission Canister Purge Valve
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Vapor jumper tube-to-Evaporative Emission (EVAP) canister purge valve quick connect coupling (part of 9G279)
2	-	Vapor jumper tube-to-EVAP canister purge valve quick connect coupling (part of 9G271)

3	14A464	EVAP canister purge valve electrical connector (part of 14290)
4	9G641	EVAP canister purge valve
5	9F931	EVAP canister purge valve bracket

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

3.0L and 3.5L vehicles

NOTE: The lower cowl panel grille must be removed to access the Evaporative Emission (EVAP) canister purge valve.

1. Remove the lower cowl panel grille. For additional information, refer to the Cowl Panel Grille procedure in **FRONT END BODY PANELS** article.

   All vehicles

2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Disconnect the EVAP canister purge valve electrical connector.
4. Disconnect the 2 vapor jumper tube-to-EVAP canister purge valve quick connect couplings. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
5. Depress the tab and remove the EVAP canister purge valve from the bracket.

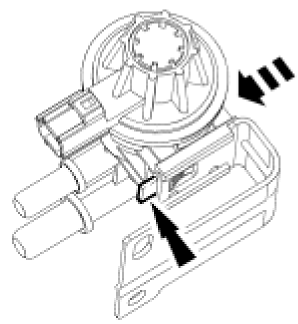

Fig. 2: Removing EVAP Canister Purge Valve From Bracket
Courtesy of FORD MOTOR CO.

6. To install, reverse the removal procedure.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to **Evaporative Emission System Leak Test**.

EVAPORATIVE EMISSION CANISTER

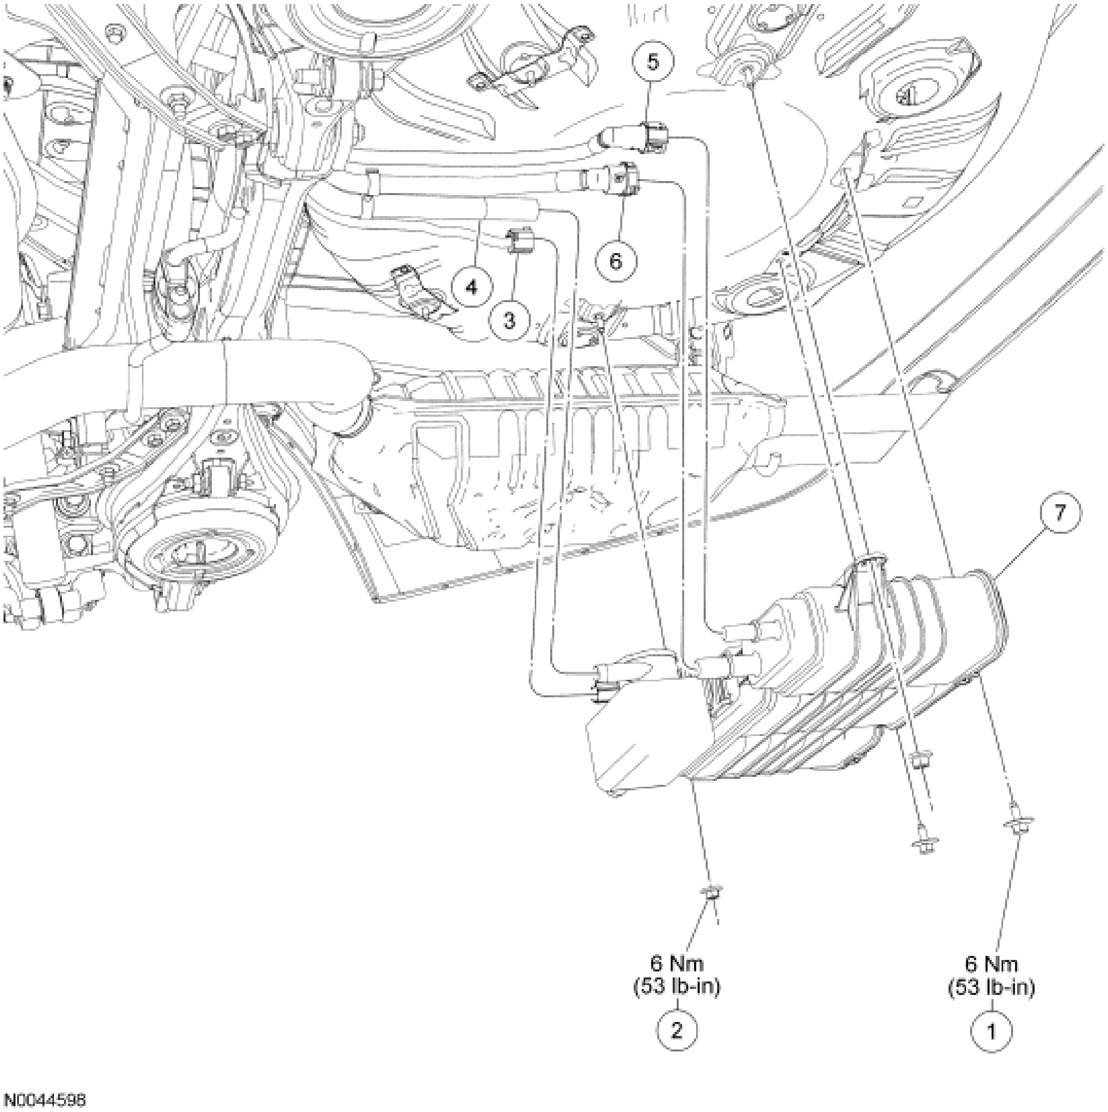

Fig. 3: Exploded View Of Evaporative Emission Canister With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W708029	Evaporative Emission (EVAP) canister bolt (2 required)
2	W707142	EVAP canister nut (2 required)
3	14A464	EVAP canister vent solenoid electrical connector (part of 14A005)
4	-	Fresh air hose (part of 9034)
5	-	Vapor tube-to-EVAP canister quick connect coupling (part of 9J279)

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

NOTE: Clean the Evaporative Emission (EVAP) canister vent solenoid electrical connector and the immediate surrounding area of any dirt or foreign material.

3. Disconnect the EVAP canister vent solenoid electrical connector.
4. Disconnect the fresh air hose from the dust separator.
5. Disconnect the fuel vapor tube assembly-to-EVAP canister quick connect couplings. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
6. Disconnect the vapor tube-to-EVAP canister quick connect couplings. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
7. Remove the 2 nuts, 2 bolts and the EVAP canister assembly.
   - To install, tighten to 6 Nm (53 lb-in).
8. To install, reverse the removal procedure.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to **Evaporative Emission System Leak Test**.

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise,**

fuel may spray out. Failure to follow these instructions may result in serious personal injury.

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Carefully turn the fuel tank filler cap counterclockwise approximately one-fourth turn until the thread disengages and position aside.

NOTE: **When the Fuel Draining Hose is removed, the fitting on the end of the hose can become detained by the safety valve. Carefully remove the hose using a gentle agitating motion to avoid detaching the hose from the fitting.**

NOTE: **The Fuel Draining Hose must be inserted into the fuel tank filler pipe until the fitting on the end of the hose enters into the fuel tank, opening the safety valve.**

4. Insert the Fuel Draining Hose into the fuel tank filler pipe.

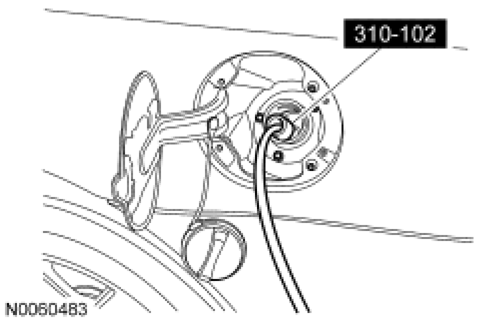

Fig. 5: Inserting Special Tool (310-102) Into Fuel Tank Filler Pipe
Courtesy of FORD MOTOR CO.

NOTE: **This step will remove approximately one-eighth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe.**

5. Attach the Fuel Storage Tanker to the Fuel Draining Hose and remove as much fuel as possible from the fuel tank and fuel tank filler pipe.

6. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 10 Nm (89 lb-in).
7. Disconnect the Fuel Tank Pressure (FTP) sensor electrical connector.
8. Disconnect the fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
9. Disconnect the fuel vapor tube assembly-to-recirculation tube quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
10. Release the 2 swivel clips.
11. Install a suitable lifting device under the fuel tank.
12. Remove the 4 bolts and the fuel tank straps.
    - To install, tighten to 40 Nm (30 lb-ft).
13. Partially lower the fuel tank enough to access the fuel tank filler pipe hose clamp.

NOTE:	**Some residual fuel may remain in the fuel tank filler pipe. When removing the filler pipe, carefully drain the fuel into a suitable container.**

14. Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.
    - To install, tighten to 4 Nm (35 lb-in).
15. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
16. Remove the fuel vapor tube assembly.
17. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to **Evaporative Emission System Leak Test**.

DESCRIPTION AND OPERATION

EXHAUST SYSTEM

The 2.3L exhaust system consists of:

- a one-piece catalytic converter manifold.
- an exhaust flexible pipe.
- an underbody catalytic converter.
- a production muffler and tailpipe assembly.
- isolators installed on the body and muffler hangers.

The 3.0L exhaust system consists of:

- a one-piece catalytic converter manifold(s) (LH on all vehicles, RH on front wheel drive [FWD] vehicles).
- an exhaust manifold mounted catalytic converter (RH on all wheel drive [AWD] vehicles).
- an exhaust flexible pipe.
- an underbody catalytic converter.
- a production muffler and tailpipe assembly.
- isolators installed on the body and muffler hangers.

The 3.5L exhaust system consists of:

- two exhaust manifold mounted catalytic converters.
- an exhaust Y-pipe.
- a resonator and flex assembly.
- a production muffler and tailpipe assembly.
- isolators installed on the body and muffler hangers.

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters, a muffler assembly and resonator. Rubber exhaust hanger isolators attach the exhaust system to the hangers welded on the body.

Catalytic Converter

The catalytic converter plays a major role in the emission control system. The catalytic converter operates as a gas reactor. Its catalytic function is to speed the heat-producing chemical reaction of components in the exhaust gases in order to reduce air pollutants.

The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary for the catalytic converter.

Sound Insulators and Shields

Sound insulators and shields, attached to the underbody, protect the vehicle from exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator and shield is damaged or shows evidence of deterioration, it should be replaced. The sound insulators and shields for the muffler, muffler pipe, resonator and catalytic converter pipe are installed separately.

Precautions

CAUTION: **Do not use leaded fuel in a vehicle equipped with a catalytic converter. In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel can destroy the catalyst and render the catalytic converter useless. The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.**

CAUTION: **Extremely high temperatures of 1,100°C (2,012°F) or above due to misfiring or an over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual operating conditions, such as engine overheating and backfiring.**

Some exhaust fasteners must be discarded and new ones installed as indicated in the procedures. Also, any damaged or heavily corroded fasteners should be discarded and new ones installed. Some exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

DIAGNOSTIC TESTS

EXHAUST SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Electronic Vibration Analyzer or equivalent	100-F027 (014-00344)

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.
3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

VISUAL INSPECTION CHART

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler • Broken or damaged exhaust hanger brackets or isolators • Damaged catalytic converter • Cracked exhaust manifold • Loose or damaged heat shields

4. Verify that the exhaust system is installed correctly, with clamps correctly located and tightened to specification.
5. If the fault is not visually evident, determine the symptom. Go to **Symptom Chart - Exhaust System** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Exhaust System

Symptom Chart - Exhaust System

Condition	Possible Sources	Action
• Vehicle has low or no power - vehicle performance complaint	• Exhaust pipe pinched or crushed • Damaged catalytic converter • Loose obstruction in exhaust	• INSPECT the exhaust components for damage. REPAIR or INSTALL new components as necessary. TEST the system for normal operation. If the concern is still present, REFER to the **Introduction - Gasoline Engines** article.
	• Restricted exhaust (possible frozen condensate in muffler)	• CHECK drain holes for foreign material. PARK the vehicle inside to thaw. TEST the vehicle for normal operation. If the concern is still present, REFER to the **Introduction - Gasoline Engines** article.

• Burning smell - usually occurs at idle, with possible traces of smoke	• Foreign material caught in exhaust system • Missing heat shields	• INSPECT the exhaust system for foreign material or missing heat shields. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Odor - described as a sulfur or rotten egg smell	• Catalytic converter • Excessive sulfur content in fuel	• At times, a slight sulfur smell is normal for catalytic converters. The cause is the sulfur content in the gasoline being used. ADVISE the customer no repair is required.
	• Rich fuel conditions • Misfire conditions	• REFER to the **Introduction - Gasoline Engines** article.
• Visible rust on surface of exhaust pipes	• Catalytic converter/exhaust system	• Surface rust is a characteristic of materials used on exhaust systems. Exposure to heat or road salt may result in surface rust. INSPECT for perforations. If there are no perforations, the condition is normal.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
		• INSPECT the exhaust system for loose or missing heat shields or foreign material

		trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm (62 lb-in). If the heat shields are missing, INSTALL new heat shields or exhaust system components as necessary. If a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary. TEST the system for normal operation after the repair.
• Rattle, squeaks or buzz type noise - from the bottom of the vehicle	• Loose or damaged heat shield	
	• Loose or damaged exhaust isolators	• VERIFY that the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Damaged exhaust isolator hanger bracket	• INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets. INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged catalytic converter or muffler	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components (except the exhaust flexible pipe) to duplicate the noise concern. Lightly TAP on the muffler, then the catalytic converter. DETERMINE if there are loose or broken

		baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the **Exhaust System Alignment**.
• Drone or clunk type noise - from the bottom of the vehicle	• Loose or damaged exhaust isolators	• INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the **Exhaust System Alignment**.
• Whistles, boom, hum or ticking type noise - noise tends to change as the engine warms. The noises are often accompanied by exhaust fumes	• Exhaust system leak	• INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which indicates exhaust leakage at that point. To magnify a small leak, have an assistant hold a rag over the tailpipe outlet while listening for a leak. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
		• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP

	• Catalytic converter	on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust muffler/resonator drain hole enlarged due to corrosion	• CONFIRM the drain holes are the noise source. INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Hissing or rushing noise - high frequency sound. Vehicle performance is unaffected	• Exhaust system. Exhaust flow through pipes	• CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Pinging noise - occurs when exhaust system is hot, engine turned off	• Catalytic converter/exhaust system	• Cool down pinging is a result of the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
• Vibration - occurs at idle and at low speeds. Also accompanied by a clunk or buzz type noise	• Loose or damaged exhaust isolator	• INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair. • INSPECT the exhaust isolator

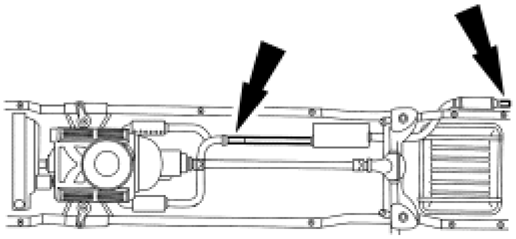
	• Loose or damaged exhaust isolator hanger brackets • Exhaust system grounded to chassis	hanger brackets for wear or damage. INSTALL or REPAIR as necessary. TEST the system for normal operation after the repair. • CARRY OUT the **Exhaust System Alignment**.
• Engine drumming noise - normally accompanied by vibration	• Damaged or misaligned exhaust system	• INSPECT the exhaust system for loose or damaged fasteners, Torca® clamps or isolators. CARRY OUT the **Exhaust System Alignment**.
• Sputter type noise - noise worse when cold, lessens or disappears when the vehicle is at operating temperature	• Damaged or worn exhaust system	• INSPECT the exhaust system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
• Thumping noise - from the bottom of the vehicle, worse at acceleration • Engine vibration - is felt with increases and decreases in engine RPM	• Misaligned exhaust system • Loose or damaged body shield • Strain on exhaust system isolators	• CHECK the exhaust system to chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary. TEST the system for normal operation after the repair. • CHECK the body shield for damaged, loose or missing fasteners. REPAIR or REPLACE as necessary. TEST the system for normal operation after the repair. • CARRY OUT the **Exhaust System Alignment**. REPAIR as necessary. TEST the system for normal operation after the repair.
• Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very RPM dependent	• Exhaust system vibration excites the body resonances inducing interior noise	• Go to **Pinpoint Test A**.

Pinpoint Test

PINPOINT TEST A: DRUMMING NOISE

A1 CHECK THE EXHAUST SYSTEM

- Key in START position.
- Increase the engine RPM until the noise is the loudest. Note the engine RPM.
- Key in OFF position.



DF1768-A

Fig. 1: Exhaust System
Courtesy of FORD MOTOR CO.

- Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tail pipe and test, then at the front pipe.
- Key in START position.
- Increase the engine RPM and listen for the drumming noise. Note the engine RPM if the noise occurs.
- Key in OFF position.
- Using a vibration analyzer (VA), determine the amount of vibration that occurs with the drumming noise.
- **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different RPM?**

  YES : REFER to **Exhaust System Alignment**. TEST the system for normal operation.

  NO : CONDUCT a diagnosis on other suspect systems. REFER to **NOISE, VIBRATION AND HARSHNESS** article.

GENERAL PROCEDURES

EXHAUST SYSTEM ALIGNMENT

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Loosen all fasteners joining the exhaust system components.
3. Beginning at the front of the vehicle, align the exhaust system to establish the maximum clearance. Make sure all fit pipes are pushed all the way into the preceding pipe and the notches are correctly lined up with the tabs.

4. Beginning at the front of the vehicle, tighten all fasteners and clamps to specification. For additional information, refer to **SPECIFICATIONS**.
5. Start the engine and check the exhaust system for leaks.

TORCA® CLAMP

1. Remove the nut from the Torca® clamp.
2. Grind the spot weld from the Torca® clamp and remove the clamp.
3. Clean the uneven surface area and position a Torca® clamp.

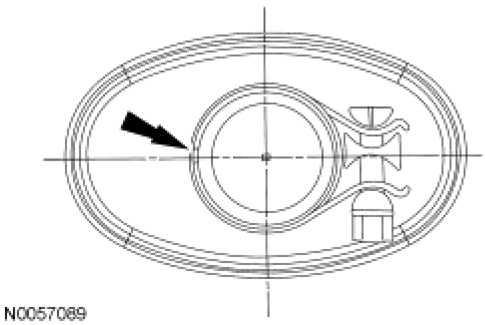


Fig. 2: Locating Uneven Surface Area
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the clamp position is no more than 27.5 mm (1.08 in) or less than 25.5 mm (1 in) from the inlet of the resonator pipe.**

4. Make sure the back of the slot is covered by the clamp and the button is fully seated inside the notch.

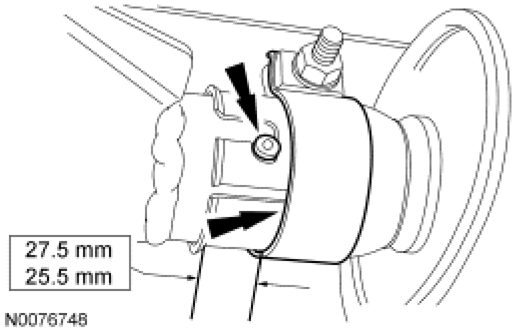

Fig. 3: Making Sure Back Of Slot Is Covered By Clamp & Button Is Fully Seated Inside Notch
Courtesy of FORD MOTOR CO.

NOTE: **Do not tighten the clamp until the exhaust system has been aligned.**

5. Tighten the Torca® clamp.
   - Tighten to 47 Nm (35 lb-ft).

1. For additional information, refer to the procedures.

CATALYTIC CONVERTER - 2.3L PZEV MANIFOLD

REMOVAL

NOTE: Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the generator air inlet duct.

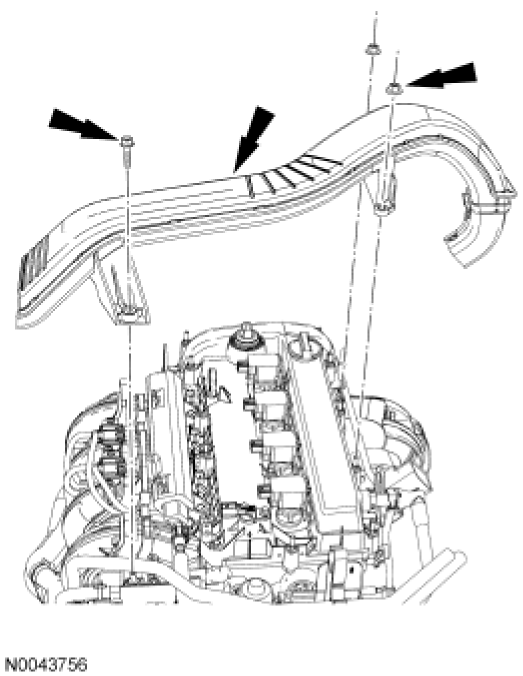

Fig. 12: Locating Generator Air Inlet Duct And Bolts
Courtesy of FORD MOTOR CO.

3. Disconnect the heated oxygen sensor (HO2S) and 2 catalyst monitor sensor electrical connectors.
4. Remove the wiring harness bracket off the stud and position it aside.
5. Remove the 2 catalytic converter manifold-to-exhaust flexible pipe nuts.
    - Discard the gasket and the 2 nuts.

6. Remove the 4 heat shield bolts and the heat shield.
7. Remove the 2 catalytic converter manifold shield bracket bolts and the bracket.
8. Loosen the 2 catalytic converter manifold bracket bolts.
9. Disconnect the secondary injection hose from the catalytic converter manifold.

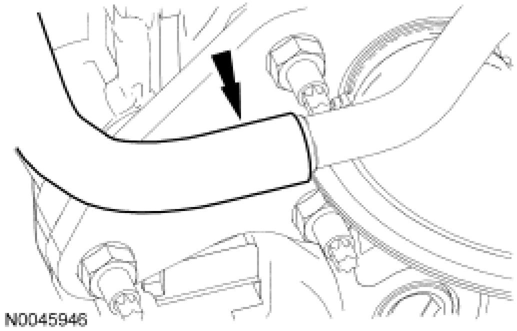

Fig. 13: Locating Secondary Injection Hose
Courtesy of FORD MOTOR CO.

10. Remove the 7 catalytic converter manifold nuts and remove it from the vehicle.
    - Discard the 7 nuts and the gasket.
11. Remove and discard the 7 catalytic converter manifold studs.
12. Clean and inspect the catalytic converter manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.

INSTALLATION

1. Install the 7 new catalytic converter manifold studs.
   - Tighten to 17 Nm (13 lb-ft).
2. Position a new catalytic converter manifold gasket on the studs.

CAUTION: Failure to tighten the catalytic converter manifold nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.

CAUTION: Failure to tighten the catalytic converter manifold nuts to specification a second time will cause the converter to develop an exhaust leak.

NOTE: Make sure to tighten the nuts in the following sequence in 2 stages.

3. Position the catalytic converter manifold and tighten the 7 new nuts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 55 Nm (41 lb-ft).
   - Stage 2: Tighten to 55 Nm (41 lb-ft).

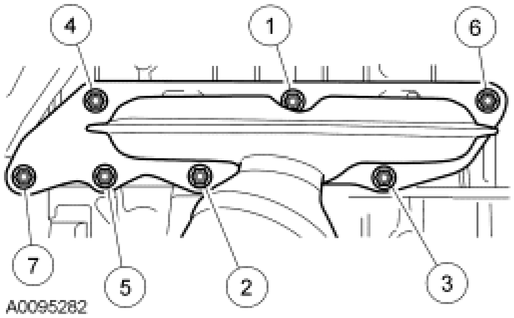

Fig. 14: Exhaust Manifold Nut Torque Sequence
Courtesy of FORD MOTOR CO.

4. Connect the secondary injection hose to the catalytic converter manifold.

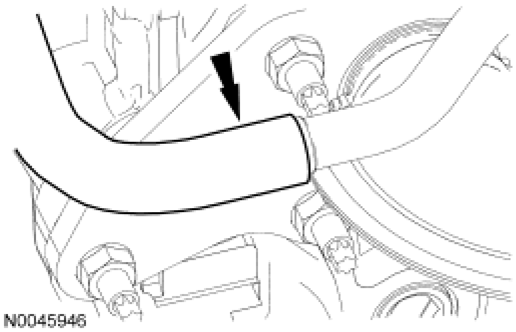

Fig. 15: Locating Secondary Injection Hose
Courtesy of FORD MOTOR CO.

5. Tighten the 2 catalytic converter manifold bracket bolts.
   - Tighten to 20 Nm (15 lb-ft).
6. Install the 2 catalytic converter manifold shield bracket bolts and the bracket.
   - Tighten to 20 Nm (15 lb-ft).
7. Position the heat shield and install the 4 heat shield bolts.
   - Tighten to 10 Nm (89 lb-in).
8. Install the 2 catalytic converter manifold-to-exhaust flexible pipe nuts.
   - Install a new gasket and nuts.
   - Tighten to 40 Nm (30 lb-ft).
9. Position the wiring harness bracket on the stud.
10. Connect the HO2S and 2 catalyst monitor sensor electrical connectors.
11. Install the generator air inlet duct.

CATALYTIC CONVERTER - 2.3L MANIFOLD

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the generator air inlet duct.

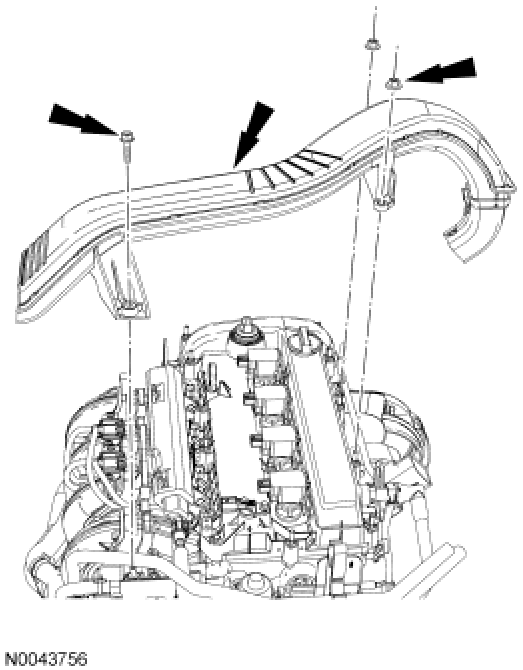

Fig. 16: Locating Generator Air Inlet Duct And Bolts
Courtesy of FORD MOTOR CO.

3. Remove the heated oxygen sensor (HO2S) and catalyst monitor sensor. For additional information, refer to **ELECTRONIC ENGINE CONTROLS - 2.3L** article.
4. Remove the wiring harness bracket from the valve cover stud and position it aside.
5. Remove the 2 catalytic converter manifold-to-exhaust flexible pipe nuts.
   - Discard the gasket and the 2 nuts.
6. Remove the 6 heat shield bolts and the heat shield.
7. Remove the 2 catalytic converter manifold shield bracket bolts and the bracket.
8. Loosen the 2 catalytic converter manifold bracket bolts.
9. Remove the 7 nuts and the catalytic converter manifold.
   - Discard the 7 nuts and the gasket.
10. Remove and discard the 7 catalytic converter manifold studs.
11. Clean and inspect the catalytic converter manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.

INSTALLATION

1. Install the 7 new catalytic converter manifold studs.

- Tighten to 17 Nm (13 lb-ft).

2. Position a new catalytic converter manifold gasket on the studs.

CAUTION: Failure to tighten the catalytic converter manifold nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.

CAUTION: Failure to tighten the catalytic converter manifold nuts to specification a second time will cause the converter to develop an exhaust leak.

NOTE: Make sure to tighten the nuts in the sequence shown in 2 stages.

3. Position the catalytic converter manifold and tighten the 7 new nuts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 55 Nm (41 lb-ft).
   - Stage 2: Tighten to 55 Nm (41 lb-ft).

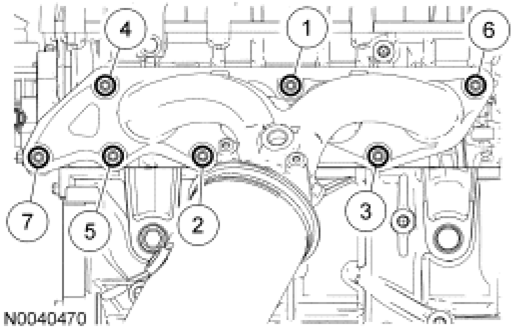

Fig. 17: Exhaust Manifold Nut Torque Sequence
Courtesy of FORD MOTOR CO.

4. Install the catalytic converter manifold shield bracket and the 2 bolts.
   - Tighten to 20 Nm (15 lb-ft).
5. Tighten the 2 catalytic converter manifold bracket bolts.
   - Tighten to 20 Nm (15 lb-ft).
6. Position the heat shield and install the 6 heat shield bolts.
   - Tighten to 10 Nm (89 lb-in).
7. Install the 2 catalytic converter manifold-to-exhaust flexible pipe nuts.
   - Install a new gasket and nuts.
   - Tighten to 40 Nm (30 lb-ft).
8. Position the wiring harness bracket on the stud.
9. Install the HO2S and catalyst monitor sensors. For additional information, refer to **ELECTRONIC ENGINE CONTROLS - 2.3L** article.
10. Install the generator air inlet duct.

CATALYTIC CONVERTER - 3.0L LH MANIFOLD

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove and discard the oil filter.
3. Remove the oil level indicator and tube. For additional information, refer to **ENGINE - 3.0L (4V)** article.
4. Remove the heated oxygen sensor (HO2S) and the catalyst monitor sensor. For additional information refer to **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article.
5. Remove the 2 LH catalytic converter-to-exhaust flexible pipe nuts.
   - Discard the gasket and the 2 nuts.
6. Remove the 4 bolts and the LH catalytic converter manifold shield.
7. Remove the 2 LH catalytic converter manifold shield bracket bolts and the shield bracket.
8. Loosen the 2 LH catalytic converter manifold bracket bolts.
9. Remove the 6 nuts and the LH catalytic converter manifold.
   - Discard the 6 LH catalytic converter manifold nuts and the gasket.
10. Remove and discard the 6 LH catalytic converter manifold studs.
11. Clean and inspect the catalytic converter manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.

INSTALLATION

1. Install the 6 new LH catalytic converter manifold studs.
   - Tighten to 11 Nm (8 lb-ft).
2. Position a new LH catalytic converter manifold gasket on the studs.
3. Position the LH catalytic converter manifold and finger tighten the 6 new nuts.
4. Install a new gasket and finger tighten 2 new nuts at the LH catalytic converter-to-exhaust flexible pipe.

CAUTION: Failure to tighten the catalytic converter manifold nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.

CAUTION: Failure to tighten the catalytic converter manifold nuts to specification a second time will cause the converter to develop an exhaust leak.

NOTE: Make sure to tighten the nuts in the sequence shown in 2 stages.

5. Position the LH catalytic converter manifold and tighten the 6 new nuts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 20 Nm (15 lb-ft).

- Stage 2: Tighten to 20 Nm (15 lb-ft).

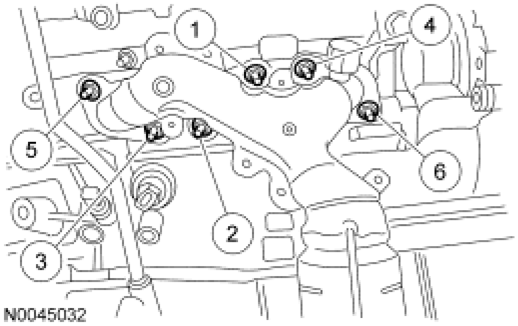

Fig. 18: Identifying Catalytic Converter Manifold Nuts Tightening Sequence
Courtesy of FORD MOTOR CO.

6. Install the shield bracket and the 2 LH catalytic converter manifold shield bracket bolts.
   - Tighten to 20 Nm (15 lb-ft).
7. Tighten the 2 LH catalytic converter manifold bracket bolts.
   - To install, tighten to 20 Nm (15 lb-ft).
8. Position the LH catalytic converter manifold shield and install the 4 bolts.
   - Tighten to 10 Nm (89 lb-in).
9. Tighten the 2 new LH catalytic converter-to-exhaust flexible pipe nuts in 3 stages:
   - Stage 1: Tighten the passenger side nut to 5 Nm (44 lb-in).
   - Stage 2: Tighten the driver side nut to 40 Nm (30 lb-ft).
   - Stage 3: Tighten the passenger side nut to 40 Nm (30 lb-ft).
10. Install the HO2S and the catalyst monitor sensor. For additional information refer to **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article.
11. Install the oil level indicator and tube. For additional information, refer to **ENGINE - 3.0L (4V)** article.
12. Install a new oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

CATALYTIC CONVERTER - 3.0L RH MANIFOLD, FRONT WHEEL DRIVE (FWD)

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the exhaust flexible pipe. For additional information, refer to **Exhaust Flexible Pipe - 2.3L, 3.0L**.
3. Remove the EGR tube. For additional information, refer to **ENGINE EMISSION CONTROL - 3.0L (4V)** article.
4. Disconnect the heated oxygen sensor (HO2S) and catalyst monitor sensor electrical connectors.
5. Remove the 2 bolts and the RH catalytic converter manifold shield.

6. Remove the 2 RH catalytic converter manifold shield bracket bolts and the shield bracket.
7. Loosen the 2 RH catalytic converter manifold bracket bolts.
8. Remove the 6 nuts and the RH catalytic converter manifold.
   - Discard the 6 RH catalytic converter manifold nuts and gasket.
9. Remove the 6 RH catalytic converter manifold studs and discard.
10. Clean and inspect the catalytic converter manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.

INSTALLATION

1. Install the 6 new RH catalytic converter manifold studs.
   - Tighten to 11 Nm (8 lb-ft).
2. Position a new RH catalytic converter manifold gasket on the studs.

CAUTION: Failure to tighten the catalytic converter nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.

CAUTION: Failure to tighten the catalytic converter nuts to specification a second time will cause the converter to develop an exhaust leak.

NOTE: Make sure to tighten the nuts in the sequence shown in 2 stages.

3. Position the RH catalytic converter manifold and tighten the 6 new nuts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten to 20 Nm (15 lb-ft).

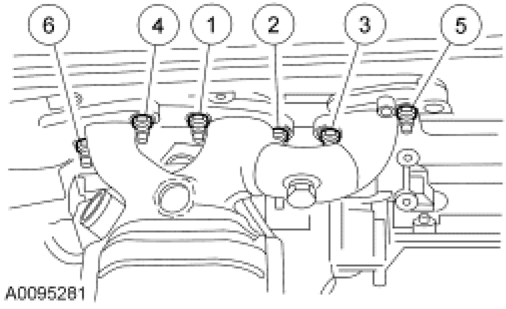

Fig. 19: Exhaust Manifold Nut Torque Sequence
Courtesy of FORD MOTOR CO.

4. Install the shield bracket and the 2 RH catalytic converter manifold shield bracket bolts.
   - Tighten to 20 Nm (15 lb-ft).

5. Tighten the 2 RH catalytic converter manifold bracket bolts.
    - Tighten to 20 Nm (15 lb-ft).
6. Position the RH catalytic converter manifold shield and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
7. Connect the HO2S and catalyst monitor sensor electrical connectors.
8. Install the EGR tube. For additional information, refer to **ENGINE EMISSION CONTROL - 3.0L (4V)** article.
9. Install the exhaust flexible pipe. For additional information, refer to **Exhaust Flexible Pipe - 2.3L, 3.0L**.

CATALYTIC CONVERTER - 3.0L RH, ALL WHEEL DRIVE (AWD)

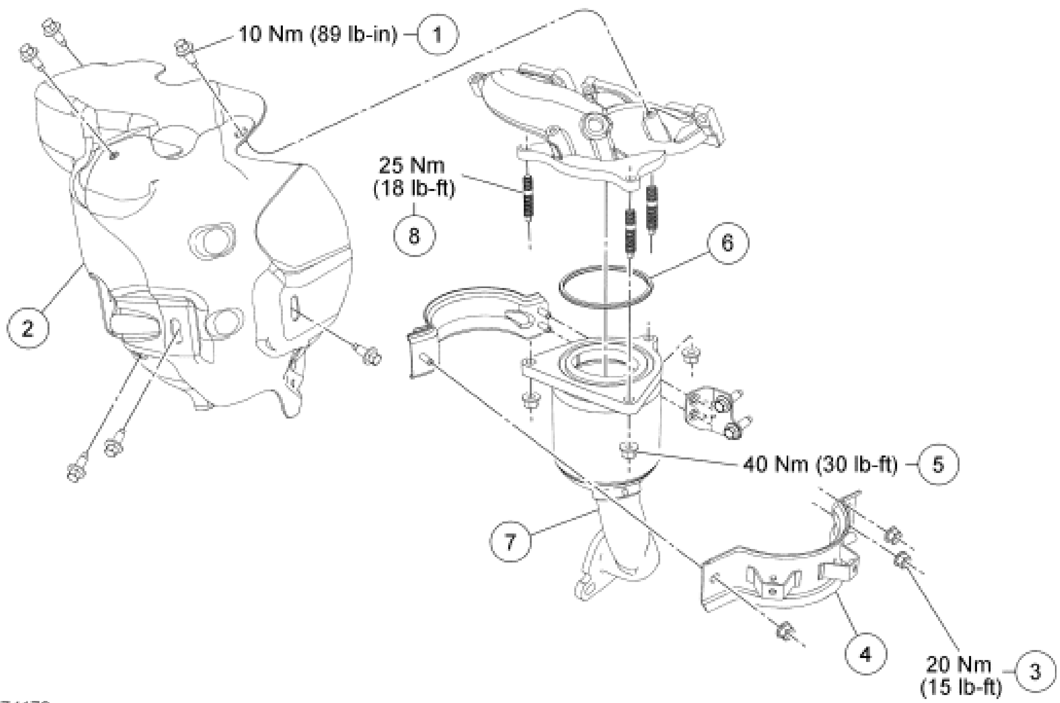

Fig. 20: Exploded View Of Catalytic Converter With Torque Specifications - 3.0L RH, All Wheel Drive (AWD)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W503921	Heat shield bolt (6 required)
2	5K282	Heat shield
3	W701706	Heat shield bracket nut (3 required)
4	5K291	Heat shield bracket
5	W705443	Catalytic converter nut (3 required)
6	5F263	Gasket
7	5E211	Catalytic converter

8	W711133	RH catalytic converter-to-exhaust manifold stud (3 required)

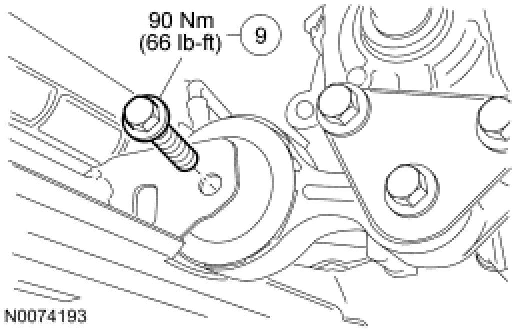

Fig. 21: Exploded View Of Catalytic Converter With Torque Specification - 3.0L RH, All Wheel Drive (AWD)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
9	W711575	Roll restrictor bolt

REMOVAL AND INSTALLATION

NOTE: Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the exhaust flexible pipe. For additional information, refer to **Exhaust Flexible Pipe - 2.3L, 3.0L**.
3. Remove the intermediate shaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
4. Remove the heated oxygen sensor (HO2S) and catalyst monitor sensor. For additional information, refer to **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article.
5. Remove the roll restrictor bolt and rotate the engine forward.
   - To install, tighten to 90 Nm (66 lb-ft).
6. Remove the 6 bolts and position aside the heat shield.
   - To install, tighten to 10 Nm (89 lb-in).
7. Remove the 3 nuts and the heat shield brackets.
   - To install, tighten to 20 Nm (15 lb-ft).
8. Remove the 3 nuts and the RH catalytic converter.
   - Discard the 3 RH catalytic converter nuts and gasket.
   - To install, tighten to 40 Nm (30 lb-ft).
9. Remove and discard the 3 RH catalytic converter-to-exhaust manifold studs.

- To install, tighten to 25 Nm (18 lb-ft).

10. To install, reverse the removal procedure.
    - Install a new gasket, nuts and studs as indicated.

CATALYTIC CONVERTER - 3.5L RH

REMOVAL AND INSTALLATION

All vehicles

NOTE: Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the exhaust Y-pipe. For additional information, refer to **Exhaust Y-Pipe - 3.5L**.

All wheel drive (AWD)

3. Remove the intermediate shaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

All vehicles

4. Remove the 2 bolts and the power steering gear shield.
    - To install, tighten to 15 Nm (11 lb-ft).

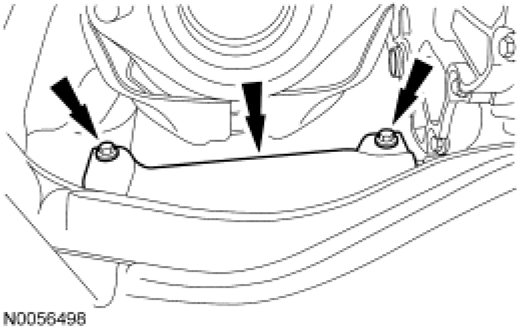

Fig. 22: Identifying Power Steering Rack Shield & Bolts
Courtesy of FORD MOTOR CO.

5. Remove the roll restrictor bolt and rotate the engine forward.
    - To install, tighten to 90 Nm (66 lb-ft).
6. Disconnect the catalyst monitor sensor electrical connector.
7. Remove the 2 bracket-to-RH catalytic converter bolts.
    - To install, tighten to 20 Nm (15 lb-ft).

8. Remove the 4 nuts and the RH catalytic converter.
    - Discard the 4 RH catalytic converter nuts and gasket.
    - To install, tighten in a cross pattern to 40 Nm (30 lb-ft).
9. To install, reverse the removal procedure.
    - Install a new gasket, nuts and studs as indicated.

CATALYTIC CONVERTER - 3.5L LH

REMOVAL AND INSTALLATION

NOTE: Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the catalyst monitor sensor electrical connector.
3. Remove the exhaust Y-pipe. For additional information, refer to **Exhaust Y-Pipe - 3.5L**.
4. Remove the 2 catalytic converter support bracket-to-transmission bolts.
    - To install, tighten to 48 Nm (35 lb-ft).
5. Remove the 4 nuts and the LH catalytic converter.
    - Discard the 4 LH catalytic converter nuts and gasket.
    - To install, tighten in a cross pattern to 40 Nm (30 lb-ft).
6. To install, reverse the removal procedure.
    - Install a new gasket, nuts and studs as indicated.

EXHAUST FLEXIBLE PIPE - 2.3L, 3.0L

REMOVAL

CAUTION: Do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the exhaust system may occur.

All vehicles

NOTE: Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. If equipped, remove the 6 screws and the underbody shield.

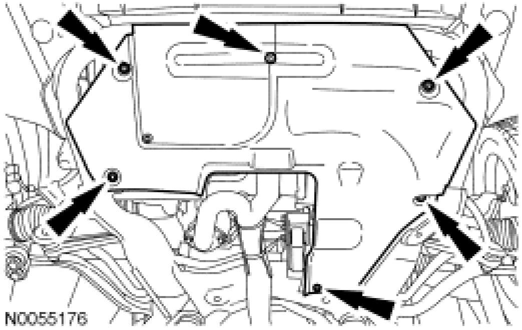

Fig. 23: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

3. Remove and discard the 2 exhaust flexible pipe-to-catalytic converter nuts.
    - Discard the gasket.

3.0L vehicles

4. Remove and discard the 2 RH catalytic converter-to-exhaust flexible pipe nuts.
    - Discard the gasket.
5. Remove and discard the 2 LH catalytic converter-to-exhaust flexible pipe nuts and remove the exhaust flexible pipe.
    - Discard the gasket.

2.3L vehicles

6. Remove and discard the 2 catalytic converter manifold-to-exhaust flexible pipe nuts and remove the exhaust flexible pipe.
    - Discard the gasket.

INSTALLATION

2.3L vehicles

1. Install the exhaust flexible pipe, a new gasket and the 2 new catalytic converter manifold-to-exhaust flexible pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

3.0L vehicles

2. Install the exhaust flexible pipe, a new gasket and hand tighten the 2 new LH catalytic converter-to-exhaust flexible pipe nuts.
    - Tighten the LH catalytic converter-to-exhaust flexible pipe in 3 stages:
        - Stage 1: Tighten the passenger side nut to 5 Nm (44 lb-in).
        - Stage 2: Tighten the driver side nut to 40 Nm (30 lb-ft).

- Stage 3: Tighten the passenger side nut to 40 Nm (30 lb-ft).

3. Install the 2 new RH catalytic converter-to-exhaust flexible pipe nuts.
   - Install a new gasket.
   - Tighten to 40 Nm (30 lb-ft).

All vehicles

4. Install a new gasket and 2 new exhaust flexible pipe-to-catalytic converter nuts.
   - Tighten to 40 Nm (30 lb-ft).
5. If equipped, install the underbody shield and the 6 screws.
6. Start the engine a check for exhaust leaks.

EXHAUST Y-PIPE - 3.5L

REMOVAL AND INSTALLATION

NOTE: Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. If equipped, remove the 6 screws and the underbody shield.

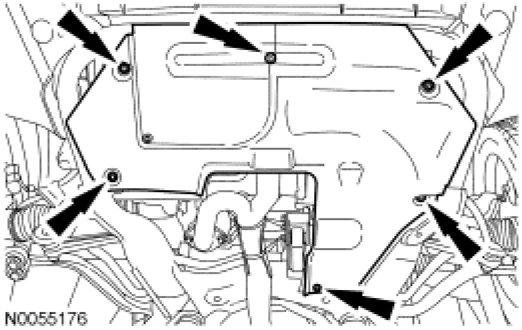

Fig. 24: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

3. Remove and discard the 2 exhaust Y-pipe-to-resonator nuts.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).
4. Remove and discard the 2 RH catalytic converter-to-exhaust Y-pipe nuts.
   - To install, tighten to 40 Nm (30 lb-ft).
5. Remove and discard the 2 LH catalytic converter-to-exhaust Y-pipe nuts and remove the exhaust Y-pipe.
   - Discard the gasket.

- Tighten in 3 stages:
  - Stage 1: Tighten the passenger side nut to 5 Nm (44 lb-in).
  - Stage 2: Tighten the driver side nut to 40 Nm (30 lb-ft).
  - Stage 3: Tighten the passenger side nut to 40 Nm (30 lb-ft).

6. To install, reverse the removal procedure.
   - Install new gaskets and nuts.
7. Start the engine and check for exhaust leaks.

CATALYTIC CONVERTER - 2.3L, 3.0L

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove and discard the 2 exhaust flexible pipe-to-catalytic converter nuts.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).
3. Remove the Torca® clamp. For additional information, refer to **Torca® Clamp**.
4. Separate the catalytic converter from the muffler and tailpipe and remove the catalytic converter.
5. To install, reverse the removal procedure.
   - Install a new gasket and nuts.
6. Start the engine and check for exhaust leaks.

RESONATOR - 3.5L

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove and discard the 2 exhaust Y-pipe-to-resonator nuts.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).
3. Remove the Torca® clamp. For additional information, refer to **Torca® Clamp**.
4. Separate the resonator from the muffler and tailpipe and remove the resonator.
5. To install, reverse the removal procedure.
   - Install a new gasket and nuts.
6. Start the engine and check for exhaust leaks.

MUFFLER AND TAILPIPE

REMOVAL AND INSTALLATION

CAUTION: Do not use oil or grease-based lubricants on the isolators. They may

cause deterioration of the rubber.

CAUTION: Oil or grease-based lubricants on the isolators may cause the exhaust hanger isolator to separate from the exhaust hanger bracket during vehicle operation.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Support the muffler and tailpipe with a suitable jackstand.

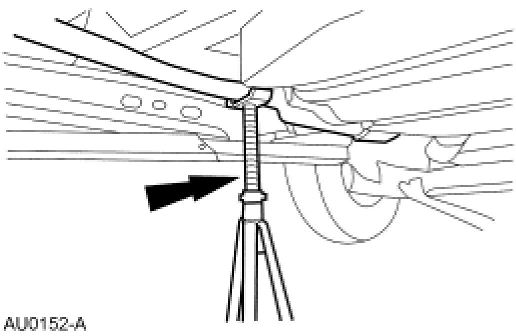

Fig. 25: Supporting Muffler & Tailpipe With A Suitable Jackstand
Courtesy of FORD MOTOR CO.

CAUTION: Do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the exhaust system may occur.

3. Support the catalytic converter with a suitable jackstand.
4. Disconnect the ground clip from the exhaust hanger.

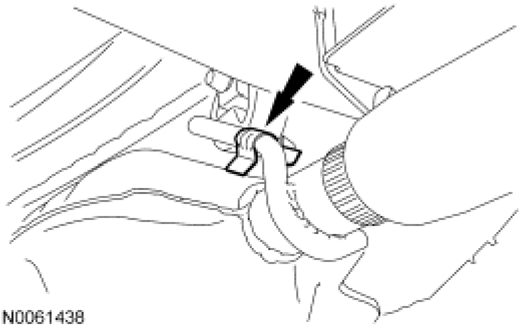

Fig. 26: Locating Ground Clip From Exhaust Hanger
Courtesy of FORD MOTOR CO.

5. Remove the Torca® clamp. For additional information, refer to **Torca® Clamp**.

NOTE: Do not damage or tear the isolators during removal.

6. Using soapy water, separate the 4 or 5 muffler and tailpipe isolators from the vehicle.
7. Separate the muffler and tailpipe from the catalytic converter and remove the muffler and tailpipe.
8. To install, reverse the removal procedure.
    - Inspect and replace any isolators damaged or torn during the removal process.
9. Start the engine and check for exhaust leaks.

2008 ACCESSORIES & BODY, CAB

Exterior Lighting - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Rear lamp assembly nuts	6	-	53
Reversing lamp switch	24	18	-

DESCRIPTION AND OPERATION

EXTERIOR LIGHTING

NOTE: **The smart junction box (SJB) is also known as the generic electronic module (GEM).**

Headlamps - Standard

The standard headlamp system is a quad-beam pattern system. It consists of replaceable low and high beam bulbs. The headlamp assembly has the park/turn indicator lamp integrated into the headlamp assembly. The SJB supplies voltage to the headlamps when demanded.

Headlamps - High Intensity Discharge (HID)

The HID headlamp system is a quad-beam pattern system. It consists of a ballast and replaceable low and high beam bulbs. The headlamp assembly has the park/turn indicator lamp integrated into the headlamp assembly. The SJB supplies voltage to the HID relays and the headlamps when demanded.

AUTOLAMPS

The autolamp system provides light sensitive automatic on/off control of the exterior lamps. The autolamp system keeps the exterior lamps on for a pre-selected period of time after the ignition switch is turned to the OFF position. The pre-selected time delay is adjustable up to approximately 3 minutes.

To program the AUTOLAMPS time delay, refer to **AUTOLAMPS Time Delay Adjustment**.

Vehicles equipped with AUTOLAMPS also have a feature that turns on the exterior lamps when the windshield wipers are turned on. For additional information, refer to **WIPERS AND WASHERS** article.

Stoplamp

The SJB monitors input from the stoplamp switch. The stoplamp are supplied voltage when the brake pedal is

applied.

Turn Signal/Hazard Lamps

When the multifunction switch is placed in the LH or RH TURN positions, the SJB routes voltage to the LH or RH turn signal lamps. The SJB then cycles the voltage on and off approximately 80 times per minute. If a front or rear turn bulb is inoperative, the SJB cycles the voltage on and off approximately 160 times per minute.

The hazard switch is located in the instrument panel center finish panel. When the hazard switch is engaged, the SJB supplies voltage to all the turn lamps. The SJB cycles the voltage on and off approximately 80 times per minute.

Parking Lamps

The SJB supplies voltage to the parking lamps when demanded. The front parking lamps are located in the headlamp assemblies. The rear parking lamps are located in the rear lamp assemblies (and in the reversing lamp assemblies for MKZ).

Fog Lamps

The fog lamp switch is integral to the headlamp switch. When the fog lamp switch is engaged, voltage is supplied by the SJB to the fog lamp relay coil, which then energizes and routes voltage to the fog lamps. The fog lamps can be turned on when the ignition switch is in the RUN or START position, the parking lamps and/or low beam headlamps are on, and the high beam headlamps are off.

Reversing Lamps

Automatic Transaxle

NOTE: The SJB receives a message from the transmission control module (TCM) when the transaxle is in REVERSE (R).

When the transaxle is placed in REVERSE (R), the SJB provides a ground for the reversing lamp relay coil (internal to the SJB). The reversing lamps receive voltage when the reversing lamp relay is energized. The reversing lamps are located within the rear lamp assemblies (Fusion), or the decklid (Milan and MKZ).

Manual Transaxle

When the transaxle is placed in REVERSE (R), the reversing lamp switch closes and provides voltage to the reversing lamps.

Daytime Running Lamps (DRL)

Fusion, Milan

NOTE: The DRL is not a programmable parameter for this vehicle.

This feature illuminates the low beam headlamps at a reduced intensity.

The SJB provides voltage to the DRL when the following conditions exist:

- The ignition switch is in the RUN position
- The low and high beam headlamps have not been activated by any other feature
- If equipped with a manual transaxle, the parking brake is not applied
- If equipped with an automatic transaxle, the transaxle is in any position except PARK (P)

The DRL feature does not affect the operation of any other exterior lighting feature.

MKZ

NOTE: The DRL is not a programmable parameter for this vehicle.

This feature continuously (not flashing) illuminates the front turn signal lamps.

The SJB provides voltage to the DRL when the following conditions exist:

- The ignition switch is in the RUN position
- The low and high beam headlamps have not been activated by any other feature
- The transaxle is in any position except PARK (P)

The DRL feature does not affect the operation of any other exterior lighting feature.

DIAGNOSTIC TESTS

HEADLAMPS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
	Flex Probe Kit	105-R025C or equivalent

 ST1438-A		

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB detects any concern with the inputs from the headlamp switch for 5 seconds, the SJB may turn on the exterior lights and keep them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB detects any headlamp switch input concern if the ignition switch was already off).

If the SJB detects a concern with the headlamp switch inputs, the SJB implements a planned strategy depending on the inputs received. If this situation occurs, the SJB should **NOT** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

The SJB also monitors the multifunction switch for a flash-to-pass or high beam request. There are 2 voltage reference circuits which monitor this. When the multifunction switch is in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground.

NOTE: The flash-to-pass feature does not require any input from the headlamp switch.

When the SJB receives an input requesting the headlamps on, the SJB supplies voltage to the low beam and high beam bulbs as necessary.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
	• Battery junction box (BJB) fuse(s): ○ 19 (40A) (low beams) ○ 26 (15A) (LH high intensity discharge [HID] headlamp)

- Headlamp switch - Multifunction switch - Headlamp assembly	27 (15A) (RH HID headlamp) - Smart junction box (SJB) fuse 11 (15A) (high beams) - Bulb(s) - Wiring, terminals or connectors - Ballast - SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to

MULTIFUNCTION ELECTRONIC MODULES article.

10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1472	Lamp Headlamp Input Circuit Short to Ground	Go to **Pinpoint Test E**.
B1510	Flash To Pass Switch Circuit Short to Ground	Go to **Pinpoint Test E**.

• The headlamps are on continuously	• Wiring, terminals or connectors • HID relay • Headlamp switch • Multifunction switch • SJB	• Go to **Pinpoint Test E**.
• The flash-to-pass feature is inoperative	• Wiring, terminals or connectors • Multifunction switch • SJB	• Go to **Pinpoint Test F**.

Pinpoint Tests

Pinpoint Test A: Both Low Beams Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Normal Operation

The battery junction box (BJB) provides voltage to the smart junction box (SJB) through circuit SBB19 (BU/RD) for the low beam operation.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST A: BOTH LOW BEAMS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK CIRCUIT SBB19 (BU/RD) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a

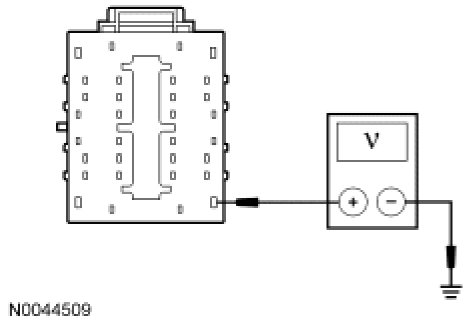

Fig. 1: Checking Circuit SBB19 (BU/RD) For Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the SJB C2280a-4, circuit SBB19 (BU/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY the BJB fuse 19 (40A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

A2 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: Both High Beams Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and

connector information.

Normal Operation

When the headlamp switch is placed in the HEADLAMPS ON position, the smart junction box (SJB) monitors the high beam request circuit from the multifunction switch through circuit CLF17 (WH/OG). When the multifunction switch is placed in the HIGH BEAM position, the signal is routed to ground through circuit GD116 (BK/VT). The SJB then energizes an internal relay which routes voltage to the high beam headlamps through circuit CLS08 (VT/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST B: BOTH HIGH BEAMS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Make sure the SJB fuse 11 (15A) is good before continuing diagnostics.

B1 CHECK THE MULTIFUNCTION SWITCH

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB multifunction switch (HBEAMSW) PID while placing the multifunction switch in the HIGH BEAM position.
- **Does the PID indicate the high beam switch is active?**

  YES : Go to B5.

  NO : Go to B2.

B2 CHECK THE MULTIFUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multifunction Switch C202

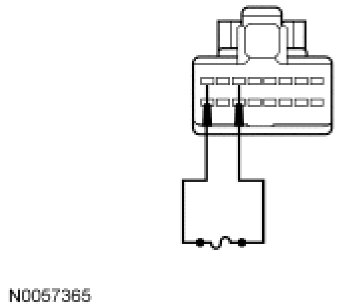

Fig. 2: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and the multifunction switch C202-8, circuit GD145 (BK/BU), harness side.
- Place the headlamp switch in the HEADLAMPS ON position.
- Key in ON position.
- **Do the high beams illuminate?**

  YES : REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to **STEERING COLUMN SWITCHES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : REMOVE the jumper wire. Go to B3.

B3 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.
- Place the headlamp switch in the OFF position.

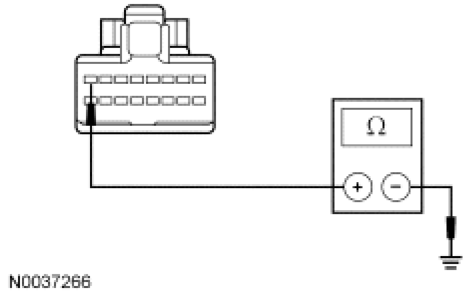

Fig. 3: Checking Circuit GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the multifunction switch C202-8, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK CIRCUIT CLF17 (WH/OG) FOR AN OPEN

- Disconnect: SJB C2280d

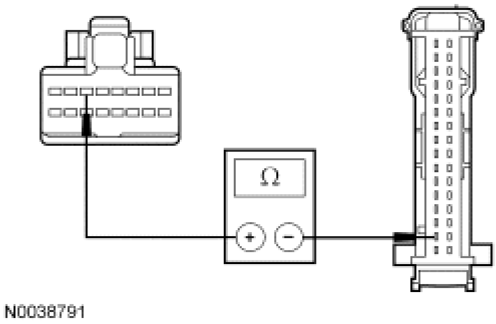

Fig. 4: Checking Circuit CLF17 (WH/OG) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and the SJB C2280d-15, circuit CLF17 (WH/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK CIRCUIT CLS08 (VT/GN) FOR AN OPEN

- Disconnect: LH Headlamp C1021
- Disconnect: SJB C2280a

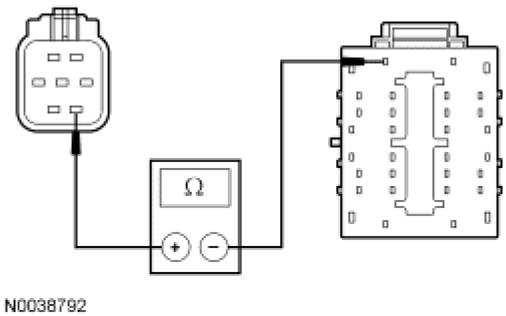

Fig. 5: Checking Circuit CLS08 (VT/GN) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH headlamp C1021-7, circuit CLS08 (VT/GN), harness side and the SJB C2280a-30, circuit CLS08 (VT/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.

- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: One Low Beam Headlamp Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Fuse and Relay Information for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage to circuits CLF04 (BN/BU) and CLF05 (BU/GN).

Halogen Headlamps

Circuits CLF04 (BN/BU) and CLF05 (BU/GN) carry voltage to the LH and RH low beam headlamps, respectively. Ground is supplied on circuits GD121 (BK/YE) and GD123 (BK/GY) for the LH and RH headlamps, respectively.

High Intensity Discharge (HID) Headlamps

Circuits CLF04 (BN/BU) and CLF05 (BU/GN) carry voltage to the LH and RH HID relay coils, respectively. Ground for the HID relay coils is provided through circuit GD121 (BK/YE). Switched voltage for the LH and RH HID relays is provided from the battery junction box (BJB) through circuits SBB26 (YE/RD) and SBB27 (BU/RD), respectively. When the relays are energized, voltage is routed to the LH and RH headlamps through circuits CLF30 (VT/BN) and CLF31 (YE/GY), respectively. Ground is supplied on circuits GD121 (BK/YE) and GD123 (BK/GY) for the LH and RH headlamps, respectively.

- DTC B1795 (Lamp Headlamp Low-Beam Circuit Open) - is a continuous DTC and sets when the SJB detects an open in the LH or RH low beam output circuit.
- DTC B1797 (Lamp Headlamp Low-Beam Circuit Short To Ground) - is a continuous DTC and sets when

the SJB detects a short to ground in the LH or RH low beam output circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- HID relay
- HID bulb
- Ballast
- Headlamp assembly
- SJB

PINPOINT TEST C: ONE LOW BEAM HEADLAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE HEADLAMP GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Headlamp

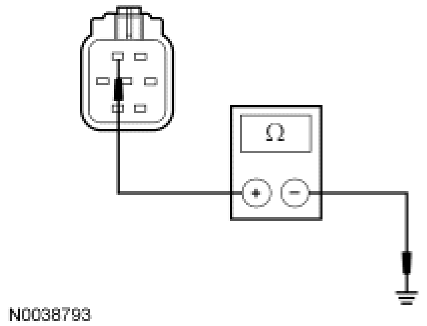

Fig. 6: Checking Headlamp Ground Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH headlamp C1021-1, circuit GD121 (BK/YE), harness side and ground; or between the RH headlamp C1041-1, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C2.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C2 CHECK FOR VOLTAGE TO THE HEADLAMP

- Place the headlamp switch in the HEADLAMPS ON position.

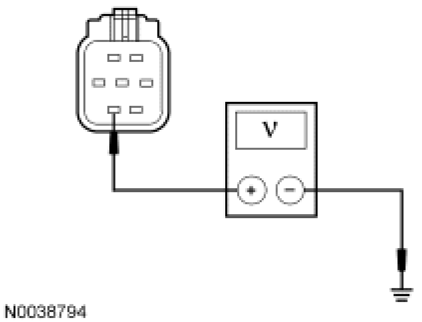

Fig. 7: Checking For Voltage To Headlamp
Courtesy of FORD MOTOR CO.

- Measure the voltage between the inoperative headlamp, harness side and ground as follows:

Inoperative Headlamp	Connector-Pin	Circuit
LH halogen LH HID	C1021-6	CLF04 (BN/BU) CLF30 (VT/BN)
RH halogen RH HID	C1041-6	CLF05 (BU/GN) CLF31 (YE/GY)

- **Is the voltage greater than 10 volts?**

  YES : For HID headlamps, go to C3.

  For halogen headlamps, REPAIR or INSTALL a new headlamp assembly. REFER to **Headlamp Assembly**. CLEAR the DTCs. REPEAT the self-test.

  NO : For HID headlamps, go to C5.

  For halogen headlamps, go to C10.

C3 CHECK THE BALLAST

- Place the headlamp switch in the OFF position.
- Install a known good ballast.
- Place the headlamp switch in the HEADLAMPS ON position.
- **Does the inoperative headlamp now illuminate?**

  YES : REMOVE the known good ballast. INSTALL a new ballast. REFER to **Ballast**. CLEAR the DTCs. REPEAT the self-test.

  NO : REMOVE the known good ballast. Go to C4.

C4 CHECK THE HID BULB

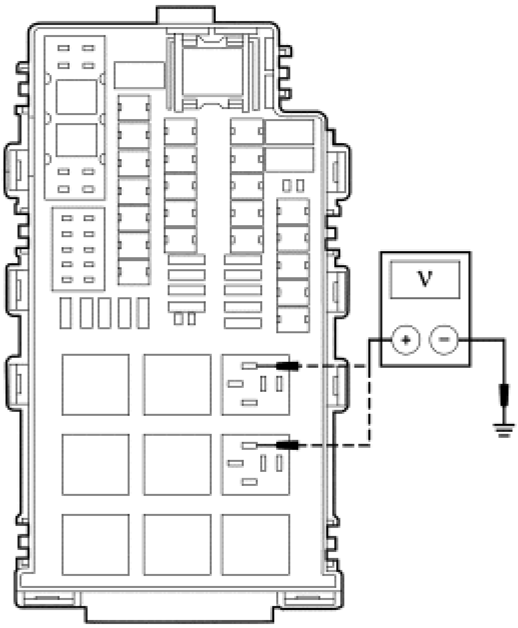
- Place the headlamp switch in the OFF position.
- Install the original ballast.
- Install a known good HID bulb.
- Place the headlamp switch in the HEADLAMPS ON position.
- **Does the inoperative headlamp now illuminate?**

  YES : INSTALL a new HID bulb. REFER to **Headlamp Bulb - LH** or **Headlamp Bulb - RH**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR or INSTALL a new headlamp assembly. REFER to **Headlamp Assembly**. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK CIRCUIT CLF04 (BN/BU) (LH HEADLAMP) OR CIRCUIT CLF05 (BU/GN) (RH HEADLAMP) FOR VOLTAGE

- Place the headlamp switch in the OFF position.
- Disconnect: Suspect HID Relay
- Place the headlamp switch in the HEADLAMPS ON position.



N0056259

Fig. 8: Checking Circuit CLF04 (BN/BU) (LH Headlamp) Or Circuit CLF05 (BU/GN) (RH Headlamp) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the LH HID relay pin 85, circuit CLF04 (BN/BU), BJB face side and ground; or between the RH HID relay pin 85, circuit CLF05 (BU/GN), BJB face side and ground.
- **Is the voltage greater than 10 volts?**

  YES : TURN the headlamps off. Go to C7.

NO : TURN the headlamps off. Go to C6.

C6 CHECK CIRCUIT CLF04 (BN/BU) (LH HEADLAMP) OR CIRCUIT CLF05 (BU/GN) (RH HEADLAMP) FOR AN OPEN OR SHORT TO GROUND (HID HEADLAMPS)

- Disconnect: SJB C2280a
- Measure the resistance between the suspect HID relay, BJB face side and the SJB, harness side; and between the suspect HID relay, BJB face side and ground as follows:

Inoperative Headlamp	Suspect Relay	SJB Connector-Pin	Circuit
LH	LH HID relay pin 85	C2280a-5	CLF04 (BN/BU)
RH	LH HID relay pin 85	C2280a-6	CLF05 (BU/GN)

- **Is the resistance less than 5 ohms between the HID relay and the SJB, and greater than 10,000 ohms between the HID relay and ground?**

  YES : Go to C11.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK CIRCUIT SBB26 (YE/RD) (LH HID RELAY) OR CIRCUIT SBB27 (BU/RD) (RH HID RELAY) FOR VOLTAGE

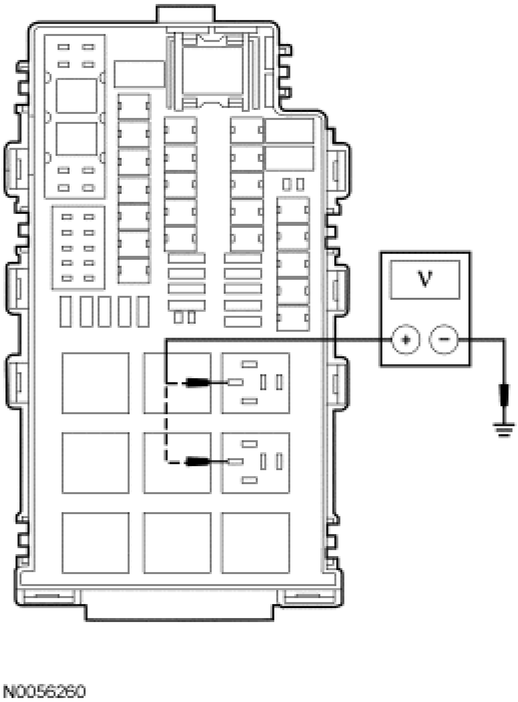


Fig. 9: Checking Circuit SBB26 (YE/RD) (LH HID Relay) Or Circuit SBB27 (BU/RD) (Rh HID Relay) For Voltage
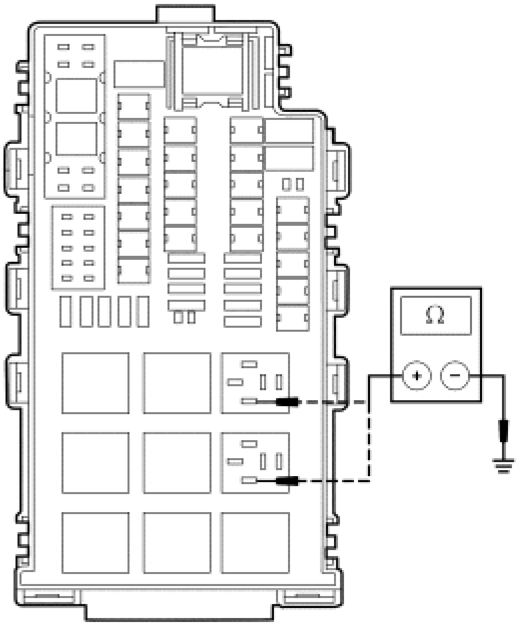
Courtesy of FORD MOTOR CO.

- Measure the voltage between the LH HID relay pin 30, circuit SBB26 (YE/RD), BJB face side and ground; or between the RH HID relay pin 30, circuit SBB27 (BU/RD), BJB face side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C8.

  NO : VERIFY the BJB fuse 26 (15A) (LH HID relay) or fuse 27 (15A) (RH HID relay) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C8 CHECK THE HID RELAY GROUND CIRCUIT FOR AN OPEN



N0056261

Fig. 10: Checking HID Relay Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH HID relay pin 86, circuit GD121 (BK/YE), BJB face side and ground; or between the RH HID relay pin 86, circuit GD121 (BK/YE), BJB face side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C9.

  NO : REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. REPEAT the self-test.

C9 CHECK THE HID RELAY

- Substitute a known good relay and recheck the headlamp operation.
- **Does the headlamp in question operate correctly?**

  YES : REMOVE the known good relay. INSTALL a new HID relay. CLEAR the DTCs. REPEAT the self-test.

  NO : REMOVE the known good relay. REPAIR circuit CLF30 (VT/BN) (LH HID relay) or circuit CLF31 (YE/GY) (RH HID relay) as necessary. CLEAR the DTCs. REPEAT the self-test.

C10 CHECK CIRCUIT CLF04 (BN/BU) (LH HEADLAMP) OR CIRCUIT CLF05 (BU/GN) (RH HEADLAMP) FOR AN OPEN OR SHORT TO GROUND (HALOGEN HEADLAMPS)

- Disconnect: SJB C2280a
- Measure the resistance between the inoperative headlamp, harness side and the SJB, harness side; and between the inoperative headlamp, harness side and ground as follows:

Inoperative	Headlamp Connector-	SJB Connector-	Circuit

Headlamp	Pin	Pin	
LH	C1021-6	C2280a-5	CLF04 (BN/BU)
RH	C1041-6	C2280a-6	CLF05 (BU/GN)

- **Is the resistance less than 5 ohms between the headlamp and the SJB, and greater than 10,000 ohms between the headlamp and ground?**

  YES : Go to C11.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C11 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: One High Beam Headlamp Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position, the SJB energizes an internal relay which routes voltage through circuit CLS08 (VT/GN) to the high beam headlamps. Ground is supplied on circuits GD121 (BK/YE) and GD123 (BK/GY) for the LH and RH high beam headlamps, respectively.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp assembly

PINPOINT TEST D: ONE HIGH BEAM HEADLAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK CIRCUIT GD121 (BK/YE) (LH HEADLAMP) OR CIRCUIT GD123 (BK/GY) (RH HEADLAMP) FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Headlamp

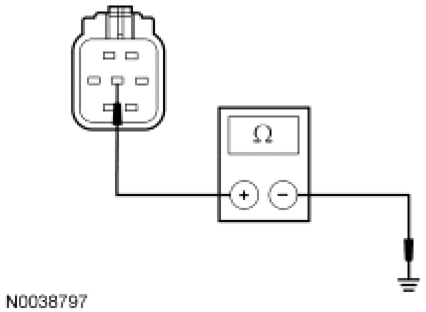


Fig. 11: Checking Circuit GD121 (BK/YE) (LH Headlamp) Or Circuit GD123 (BK/GY) (RH Headlamp) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH headlamp C1021-4, circuit GD121 (BK/YE), harness side and ground; or between the RH headlamp C1041-4, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to D2.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

D2 CHECK CIRCUIT CLS08 (VT/GN) FOR AN OPEN

- Place the headlamp switch in the HEADLAMPS ON position.
- Place the multifunction switch in the HIGH BEAM position.

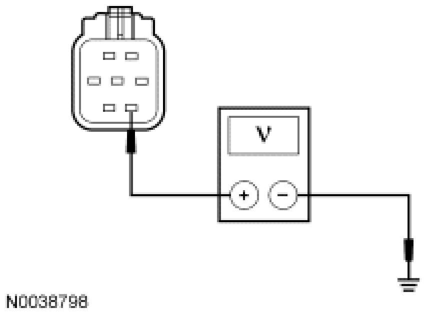

Fig. 12: Checking Circuit CLS08 (VT/GN) For Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the LH headlamp C1021-7, circuit CLS08 (VT/GN), harness side and ground; or between the RH headlamp C1041-7, circuit CLS08 (VT/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR or INSTALL a new headlamp assembly. REFER to **Headlamp Assembly**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test E: The Headlamps Are On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Fuse and Relay Information for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends reference signals to the headlamp switch through circuits CLF18 (BU/WH), CLF19 (VT/GN), CLF23 (WH/VT) and CLS34 (GY). At any given time, the headlamp switch routes one of the input circuits to ground through circuit GD116 (BK/VT). When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage to circuits CLF04 (BN/BU) and CLF05 (BU/GN).

Halogen Low Beam Headlamps

Circuits CLF04 (BN/BU) and CLF05 (BU/GN) carry voltage to the LH and RH low beam headlamps, respectively.

High Intensity Discharge (HID) Low Beam Headlamps

Circuits CLF04 (BN/BU) and CLF05 (BU/GN) carry voltage to the LH and RH HID relay coils, respectively. When the relays are energized, voltage is routed to the LH and RH headlamps through circuit CLF30 (VT/BN) and circuit CLF31 (YE/GY), respectively.

High Beam Headlamps

The SJB sends a reference signal to the multifunction switch through circuits CLF27 (GN/BN) and CLF17 (WH/OG). When the multifunction switch is placed in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground.

When the SJB detects a request for flash-to-pass (regardless of headlamp switch position), or the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position, the SJB energizes an internal relay which routes voltage through circuit CLS08 (VT/GN) to the high beam headlamps.

DTC - Description	Fault Trigger Conditions

B1472 - Lamp Headlamp Input Circuit Short to Ground	An on-demand DTC that sets when the SJB detects the headlamps on input circuit is short to ground.
B1510 - Flash To Pass Switch Circuit Short To Ground	An on-demand DTC that sets when the SJB detects the high beam request input circuit is short to ground.
B1570 - Lamp Headlamp High-Beam Circuit Short To Ground	An on-demand DTC that sets when the SJB detects the high beam request input circuit is short to ground.
B1578 - Lamp Park Input Circuit Short To Ground	An on-demand DTC that sets when the SJB detects a short to ground in the parking lamps on input circuit.
B1795 - Lamp Headlamp Low-Beam Circuit Open	A continuous DTC and sets when the SJB detects an open in the LH or RH low beam output circuit.
B2498 - Headlamp Switch Multiple Signals Input Active	A continuous DTC that sets when the SJB detects no inputs from the headlamp switch or multiple headlamp switch requests at the same time.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HID relay
- Headlamp switch
- Multifunction switch
- SJB

PINPOINT TEST E: THE HEADLAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 VERIFY THE HEADLAMP OPERATION

- Key in ON position.
- **Are the low beams illuminated?**

  YES : Go to E2.

  NO : Go to E10.

E2 CHECK THE SJB HEADLAMP SWITCH PIDs

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB headlamp switch PIDs while moving the headlamp switch through all positions. Refer to the following table.

SJB PIDs	Monitored Switch Position

AUTOLMP	AUTOLAMPS
HLMPOFF	Off
P_LMP_SW	Parking Lamps
LBEAMSW	Headlamps

- **Do the headlamp switch positions agree with the PIDs?**

  YES : Go to E7.

  NO : Go to E3.

E3 CHECK THE HEADLAMP SWITCH

- Key in OFF position.
- Disconnect: Headlamp Switch C205
- Carry out the headlamp switch component test. Refer to COMPONENT TESTING.
- **Is the headlamp switch OK?**

  YES : Go to E4.

  NO : INSTALL a new headlamp switch. REFER to **Headlamp Switch**. CLEAR the DTCs. REPEAT the self-test.

E4 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

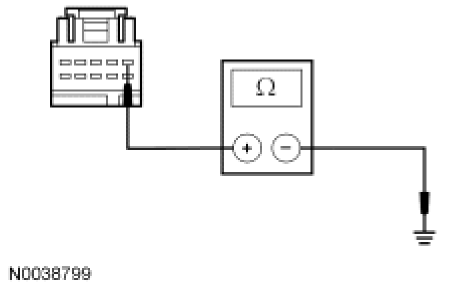

Fig. 13: Checking Circuit GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the headlamp switch C205-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

E5 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND

- Disconnect: SJB C2280d
- Measure the resistance between the headlamp switch, harness side and ground as follows:

Headlamp Switch	Circuit

Connector-Pin	
C205-9 (if equipped with AUTOLAMPS)	CLF19 (VT/GN)
C205-4	CLF23 (WH/VT)
C205-3	CLS34 (GY)
C205-8	CLF18 (BU/WH)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E6.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E6 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN

- Measure the resistance between the headlamp switch, harness side and the SJB, harness side as follows:

Headlamp Switch Connector-Pin	SJB Connector-Pin	Circuit
C205-9 (if equipped with AUTOLAMPS)	C2280d-19	CLF19 (VT/GN)
C205-4	C2280d-30	CLF23 (WH/VT)
C205-3	C2280d-5	CLS34 (GY)
C205-8	C2280d-29	CLF18 (BU/WH)

- **Are the resistances less than 5 ohms?**

  YES : Go to E14.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E7 CHECK THE SJB OUTPUT

- Disconnect: SJB C2280a
- **Does the LH or RH headlamp continue to illuminate?**

  YES : For halogen headlamps, REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) as necessary. CLEAR the DTCs. REPEAT the self-test.

  For HID headlamps, go to E8.

  NO : Go to E14.

E8 CHECK CIRCUITS CLF30 (VT/BN) (LH HEADLAMP) AND CLF31 (YE/GY) (RH HEADLAMP) FOR A SHORT TO VOLTAGE

- Disconnect: Suspect HID Relay
- **Does the LH or RH headlamp continue to illuminate?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to E9.

E9 CHECK THE HID RELAY

- Carry out the HID relay component test. Refer to COMPONENT TESTING.
- **Is the HID relay OK?**

  YES : REPAIR circuit CLF04 (BN/BU) (LH HID relay) or circuit CLF05 (BU/GN) (RH HID relay) as necessary. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new HID relay. CLEAR the DTCs. REPEAT the self-test.

E10 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B1510 or B1570 present?**

  YES : Go to E11.

  NO : Go to E13.

E11 CHECK THE MULTIFUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multifunction Switch C202
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB Self-Test
- Clear the DTCs and repeat the SJB on-demand self-test.
- **Is DTC B1510 or B1570 still present?**

  YES : Go to E12.

  NO : INSTALL a new multifunction switch. REFER to **STEERING COLUMN SWITCHES** article. CLEAR the DTCs. REPEAT the self-test.

E12 CHECK CIRCUIT CLF17 (WH/OG) (HIGH BEAM) OR CIRCUIT CLF27 (GN/BN) (FLASH-TO-PASS) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280d

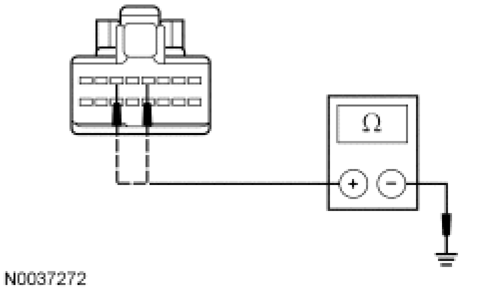

Fig. 14: Checking Circuit CLF17 (WH/OG) (High Beam) Or Circuit CLF27 (GN/BN) (Flash-To-Pass) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and ground; and between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E14.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E13 CHECK CIRCUIT CLS08 (VT/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280a
- Key in ON position.
- **Do the headlamps continue to illuminate?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to E14.

E14 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Flash-To-Pass Feature Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the multifunction switch through circuit CLF27 (GN/BN). When the multifunction switch is placed in the FLASH-TO-PASS position, the voltage signal is routed to ground. When the SJB detects a request for the flash-to-pass, the SJB energizes an internal relay which routes voltage to the high beams.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST F: THE FLASH-TO-PASS FEATURE IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

F1 VERIFY THE HIGH BEAM HEADLAMP OPERATION

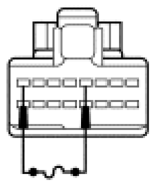
- Key in ON position.
- Place the headlamp switch in the HEADLAMPS ON position.
- Place the multifunction switch in the HIGH BEAM position while observing the headlamps.
- **Do the high beam headlamps illuminate?**

  YES : Go to F2.

  NO : Go to **Pinpoint Test B**.

F2 CHECK THE MULTIFUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multifunction Switch C202



N0037273

Fig. 15: Checking Multifunction Switch
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the multifunction switch C202-8, circuit GD116 (BK/VT), harness side.
- **Do the high beam headlamps illuminate?**

  YES : INSTALL a new multifunction switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

  NO : REMOVE the jumper wire. Go to F3.

F3 CHECK CIRCUIT CLF27 (GN/BN) FOR AN OPEN

- Disconnect: SJB C2280d

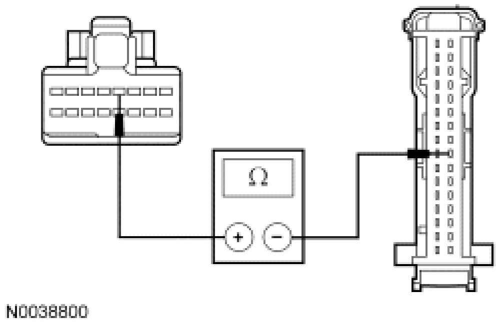


Fig. 16: Checking Circuit CLF27 (GN/BN) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the SJB C2280d-25, circuit CLF27 (GN/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F4.

  NO : REPAIR the circuit. TEST the system for normal operation.

F4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

AUTOLAMPS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1438-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB detects any concern with the inputs from the headlamp switch for 5 seconds, the SJB may turn on the exterior lights and keep them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB detects any headlamp switch input concern if the ignition switch was already off).

If the SJB detects a concern with the headlamp switch inputs, the SJB implements a planned strategy depending on the inputs received. If this situation occurs, the SJB should **NOT** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

The SJB also monitors the light sensor with a voltage reference signal. The light sensor input to the SJB varies with the ambient light conditions.

When the SJB receives an input from the headlamp switch indicating a request for the AUTOLAMPS, the SJB monitors the light sensor for the ambient light condition. If the SJB determines the ambient light level is dark, the SJB supplies voltage to the exterior lamps.

Vehicles equipped with AUTOLAMPS also have a feature that turns on the exterior lamps when the windshield wipers are on. When the SJB detects a ground signal from the windshield wiper motor, the SJB turns the exterior lamps on. For additional information, refer to **WIPERS AND WASHERS** article.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Headlamp switch	• Wiring, terminals or connectors • Light sensor • Smart junction box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1472	Lamp Headlamp Input Circuit Short to Ground	Go to **Pinpoint Test H**.
B1578	Lamp Park Input Circuit Short to Ground	Go to **Pinpoint Test H**.
B1692	Autolamp Delay Circuit Short to Ground	Go to **Pinpoint Test H**.
B1791	Autolamp Sensor Input Circuit Open	Go to **Pinpoint Test H**.
B1793	Autolamp Sensor Input Circuit Short to Ground	Go to **Pinpoint Test G**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Fuse(s) • Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The AUTOLAMPS are inoperative	• Wiring, terminals or connectors • Light sensor • SJB	• Go to **Pinpoint Test G**.
• The AUTOLAMPS are on continuously	• Wiring, terminals or connectors • Light sensor • Headlamp switch • SJB	• Go to **Pinpoint Test H**.

Pinpoint Tests

Pinpoint Test G: The AUTOLAMPS Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Normal Operation

When the headlamp switch is in the AUTOLAMPS ON position, the smart junction box (SJB) monitors the light sensor by sending a voltage reference signal through circuit VLF14 (BU/BN). Ambient lighting to the light sensor changes the voltage by varying the resistance to ground. Ground for the light sensor is provided by circuit GD116 (BK/VT).

When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB provides voltage to the exterior lamps.

- DTC B1793 (Autolamp Sensor Input Circuit Short To Ground) - is a continuous DTC that sets when the SJB detects a short to ground on the light sensor input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Light sensor
- SJB

PINPOINT TEST G: THE AUTOLAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

G1 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST

- Key in OFF position.
- Retrieve the recorded results from the SJB self-test.
- **Was DTC B1793 recorded?**

  YES : Go to G3.

  NO : Go to G2.

G2 CHECK THE MANUAL HEADLAMP OPERATION

- Place the headlamp switch in the HEADLAMPS ON position.
- **Do the headlamps operate correctly?**

  YES : Go to G3.

  NO : REFER to **Headlamps**.

G3 CHECK FOR VOLTAGE TO THE LIGHT SENSOR

- Disconnect: Light Sensor C286

- Key in ON position.
- Place the headlamp switch in the AUTOLAMPS ON position.

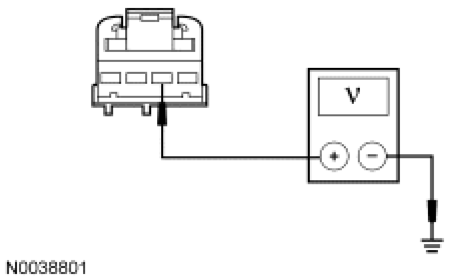

Fig. 17: Checking For Voltage To Light Sensor
Courtesy of FORD MOTOR CO.

- Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.
- **Is the voltage approximately 5 volts?**

  YES : INSTALL a new light sensor. REFER to **Light Sensor**. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to G4.

G4 CHECK CIRCUIT VLF14 (BU/BN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280d

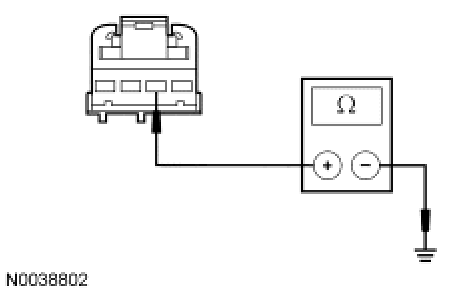

Fig. 18: Checking Circuit VLF14 (BU/BN) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

G5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: The AUTOLAMPS Are On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Headlamps/AUTOLAMPS for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends reference signals to the headlamp switch through circuits CLF18 (BU/WH), CLF19 (VT/GN), CLF23 (WH/VT) and CLS34 (GY). The SJB also sends a reference signal to the light sensor through circuit VLF14 (BU/BN). Ground for the light sensor is provided through circuit GD116 (BK/VT).

When the headlamp switch is placed in the AUTOLAMPS ON position, the voltage signal is routed to ground through circuit GD116 (BK/VT). The light sensor determines the amount of light based on the input received from the ambient sky conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB provides voltage to the exterior lamps.

DTC Description	Fault Trigger Conditions
B1472 - Lamp Headlamp Input Circuit Short to Ground	An on-demand DTC that sets when the SJB detects the headlamps on input circuit is short to ground.
B1578 - Lamp Park Input Circuit Short To Ground	An on-demand DTC that sets when the SJB detects a short to ground in the parking lamps on input circuit.
B1692 - Autolamp Delay Circuit Short To Ground	An on-demand code that sets when the SJB detects a short to ground in the AUTOLAMPS on input circuit.
B1791 - Autolamp Sensor Input Circuit Open	A continuous code that sets when the SJB detects an open on the light sensor input circuit.
B2498 - Headlamp Switch Multiple Signals Input Active	A continuous DTC that sets when the SJB detects no inputs from the headlamp switch or multiple headlamp switch requests at the same time.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Light sensor
- Headlamp switch
- SJB

PINPOINT TEST H: THE AUTOLAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

H1 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST

- Retrieve the recorded results from the SJB self-test.
- **Is DTC B1791 recorded?**

  YES : Go to H7.

  NO : Go to H2.

H2 CHECK THE SJB HEADLAMP SWITCH PIDs

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB headlamp switch PIDs while moving the headlamp switch through all positions. Refer to the following table.

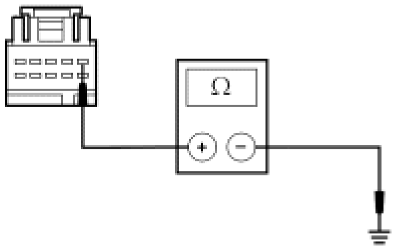
SJB PIDs	Monitored Switch Position
AUTOLMP	AUTOLAMPS
HLMPOFF	Off
P_LMP_SW	Parking Lamps
LBEAMSW	Headlamps

- **Do the headlamp switch positions agree with the PIDs?**

  YES : Go to H7.

  NO : Go to H3.

H3 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN (HEADLAMP SWITCH)



N0038799

Fig. 19: Checking Circuit GD116 (BK/VT) For An Open (Headlamp Switch)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the headlamp switch C205-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to H4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

H4 CHECK THE HEADLAMP SWITCH

- Key in OFF position.
- Disconnect: Headlamp Switch C205
- Carry out the headlamp switch component test. Refer to COMPONENT TESTING.
- **Is the headlamp switch OK?**

  YES : Go to H5.

  NO : INSTALL a new headlamp switch. REFER to **Headlamp Switch**. CLEAR the DTCs. REPEAT the self-test.

H5 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND

- Disconnect: SJB C2280d
- Measure the resistance between the headlamp switch, harness side and ground as follows:

Headlamp Switch Connector-Pin	Circuit
C205-9	CLF19 (VT/GN)
C205-4	CLF23 (WH/VT)
C205-3	CLS34 (GY)
C205-8	CLF18 (BU/WH)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to H6.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

H6 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN

- Measure the resistance between the headlamp switch, harness side and the SJB, harness side as follows:

Headlamp Switch	SJB	

Connector-Pin	Connector-Pin	Circuit
C205-9	C2280d-19	CLF19 (VT/GN)
C205-4	C2280d-30	CLF23 (WH/VT)
C205-3	C2280d-5	CLS34 (GY)
C205-8	C2280d-29	CLF18 (BU/WH)

- **Are the resistances less than 5 ohms?**

  YES : Go to H11.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

H7 CHECK FOR VOLTAGE TO THE LIGHT SENSOR

- Key in OFF position.
- Disconnect: Light Sensor C286
- Key in ON position.
- Place the headlamp switch in the AUTOLAMPS ON position.

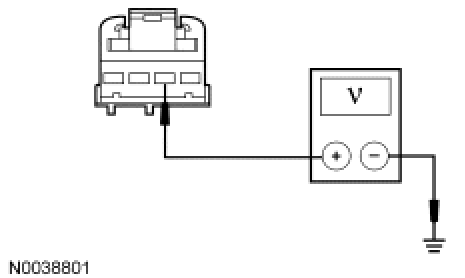


Fig. 20: Checking For Voltage To Light Sensor
Courtesy of FORD MOTOR CO.

- Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.
- **Is the voltage approximately 5 volts?**

  YES : If DTC B1791 was **not** present, INSTALL a new light sensor. REFER to **Light Sensor**. TEST the system for normal operation.

  If DTC B1791 was present, go to H8.

  NO : Go to H9.

H8 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN (LIGHT SENSOR)

- Place the headlamp switch in the OFF position.

- Key in OFF position.

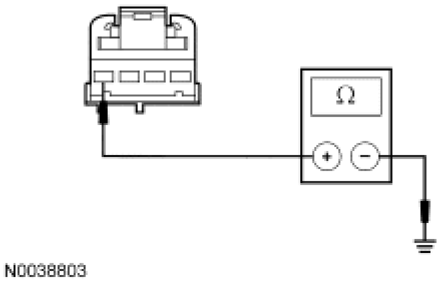

Fig. 21: Checking Circuit GD116 (BK/VT) For An Open (Light Sensor)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the light sensor C286-4, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new light sensor. REFER to **Light Sensor**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

H9 CHECK CIRCUIT VLF14 (BU/BN) FOR A SHORT TO VOLTAGE

- Place the headlamp switch in the OFF position.
- Key in OFF position.
- Disconnect: SJB C2280d
- Key in ON position.

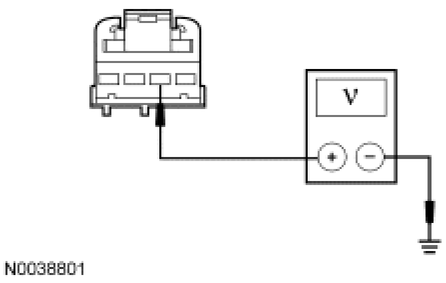

Fig. 22: Checking For Voltage To Light Sensor
Courtesy of FORD MOTOR CO.

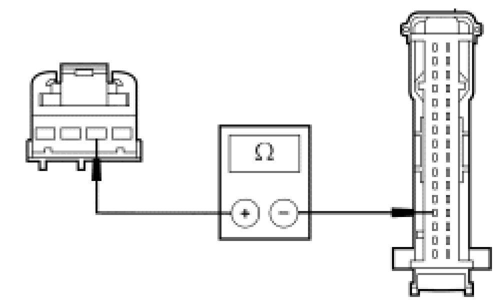
- Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to H10.

H10 CHECK CIRCUIT VLF14 (BU/BN) FOR AN OPEN

- Key in OFF position.



N0038804

Fig. 23: Checking Circuit VLF14 (BU/BN) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and the SJB C2280d-13, circuit VLF14 (BU/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H11.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

H11 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

STOPLAMP

Special Tools

Illustration	Tool Name	Tool Number

 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1438-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the input from the stoplamp switch. When the brake pedal is applied, voltage is routed to the SJB. The SJB then supplies voltage to the stoplamp.

On vehicles with combination rear stop/turn lamps, the turn and hazard lamp functions override the rear stoplamp function.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Stoplamp switch	• Smart junction box (SJB) fuse 21 (7.5A) (stoplamp switch) • Bulb(s) • Wiring, terminals or connectors • Rear lamp assembly • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

For all vehicles, the stoplamp switch is supplied voltage through circuit SBP04 (GN/RD) from the smart junction box (SJB). When the brake pedal is applied, the stoplamp switch routes voltage to the SJB through circuit CCB08 (VT/WH).

For Fusion, the SJB provides voltage to the rear stoplamp.

For Milan and MKZ, the voltage is routed through the SJB to all the stoplamp through circuit CLS17 (YE/GY).

This pinpoint test is intended to diagnose the following:

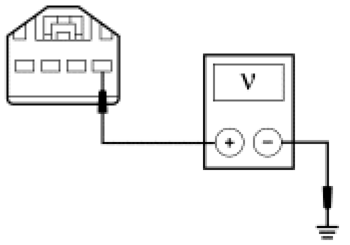
- Fuse
- Wiring, terminals or connectors
- Stoplamp switch
- SJB

PINPOINT TEST I: ALL THE STOPLAMP ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

I1 CHECK CIRCUIT SBP04 (GN/RD) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Stoplamp Switch C278



N0038805

Fig. 24: Checking Circuit SBP04 (GN/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the stoplamp switch C278-1, circuit SBP04 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to I3.

  NO : VERIFY the SJB fuse 21 (7.5A) is OK. If OK, go to I2.

I2 CHECK CIRCUIT SBP04 (GN/RD) FOR AN OPEN

- Disconnect: SJB C2280a

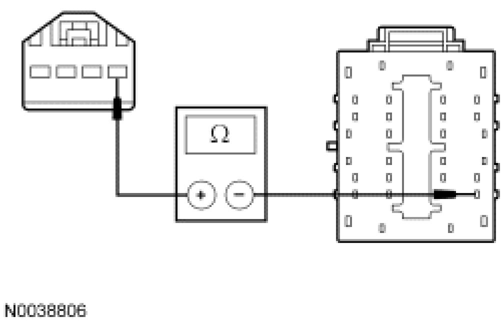


Fig. 25: Checking Circuit SBP04 (GN/RD) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the stoplamp switch C278-1, circuit SBP04 (GN/RD), harness side and the SJB C2280a-8, circuit SBP04 (GN/RD), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I3 CHECK THE STOPLAMP SWITCH

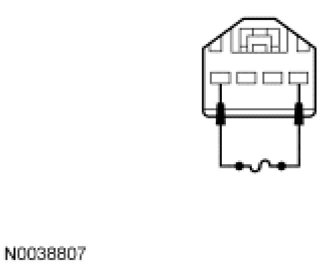

Fig. 26: Checking Stoplamp Switch
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the stoplamp switch C278-1, circuit SBP04 (GN/RD),

harness side and the stoplamp switch C278-4, circuit CCB08 (VT/WH), harness side.

- **Are the stoplamp illuminated?**

  YES : REMOVE the jumper wire. INSTALL a new stoplamp switch. REFER to **Stoplamp Switch**. CLEAR the DTCs. REPEAT the self-test.

  NO : REMOVE the jumper wire. Go to I4.

I4 CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN

- Disconnect: SJB C2280a

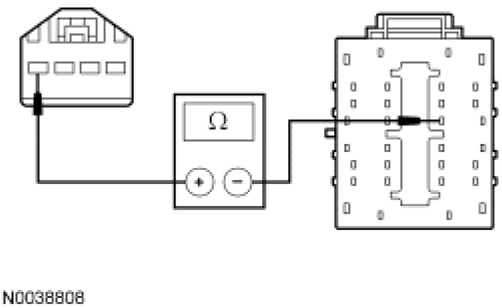

Fig. 27: Checking Circuit CCB08 (VT/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the stoplamp switch C278-4, circuit CCB08 (VT/WH), harness side and the SJB C2280a-19, circuit CCB08 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : For Fusion, go to I6.

  For Milan or MKZ, go to I5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I5 CHECK CIRCUIT CLS17 (YE/GY) FOR AN OPEN

- Disconnect: SJB C2280e
- Disconnect: High Mounted Stoplamp C475 (Parcel Shelf) or C4111 (Spoiler)

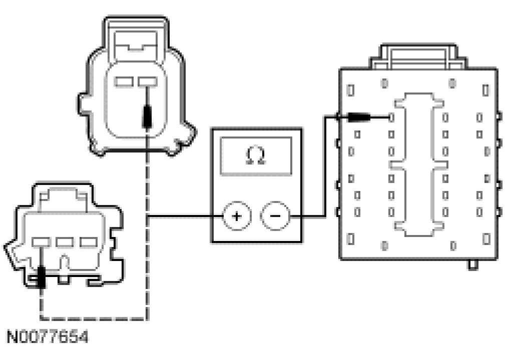

Fig. 28: Checking Circuit CLS17 (YE/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the high mounted stoplamp C475-1 (parcel shelf) or C4111-1 (spoiler), circuit CLS17 (YE/GY), harness side and the SJB C2280e-26, circuit CLS17 (YE/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: One Or More Stoplamp Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation - Fusion

When the brake pedal is applied, the stoplamp switch routes voltage to the smart junction box (SJB). The voltage is then routed through the SJB to the high mounted stoplamp through circuit CLS17 (YE/GY). When the SJB detects the brake pedal applied, the SJB provides voltage to the LH and RH rear stoplamp through circuits CLS18 (GY/BN) and CLS19 (VT/OG), respectively. Ground for the rear stoplamp is provided through circuit GD171 (BK/GY).

Milan, MKZ

When the SJB detects the brake pedal applied, voltage is routed through the SJB to the stoplamp through circuit CLS17 (YE/GY). Ground for the stoplamp is provided through circuit GD171 (BK/GY).

The rear lamps contain electronics that modulate the voltage frequency to the LED bulbs.

DTC Description	Fault Trigger Conditions
B2048 - Left Rear Turn Lamp Circuit Short to	A continuous DTC that sets when the SJB detects a short to ground on the LH rear stop/turn lamp

Ground	voltage supply circuit.
B2049 - Left Rear Turn Lamp Circuit Open	A continuous DTC that sets when the SJB detects an open on the LH rear stop/turn lamp voltage supply circuit.
B2050 - Right Rear Turn Lamp Circuit Short to Ground	A continuous DTC that sets when the SJB detects a short to ground on the RH rear stop/turn lamp voltage supply circuit.
B2051 - Right Rear Turn Lamp Circuit Open	A continuous DTC that sets when the SJB detects an open on the RH rear stop/turn lamp voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High mounted stoplamp
- Rear lamp assembly
- SJB

PINPOINT TEST J: ONE OR MORE STOPLAMP ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

J1 DETERMINE THE INOPERATIVE STOPLAMP

- Key in OFF position.
- Apply the brake pedal.
- Check the high mounted stoplamp.
- **Is the high mounted stoplamp illuminated?**

  YES : Go to J5.

  NO : Go to J2.

J2 CHECK CIRCUIT GD171 (BK/GY) FOR AN OPEN (HIGH MOUNTED STOPLAMP)

- Disconnect: High Mounted Stoplamp C475 (Parcel Shelf) or C4111 (Spoiler)

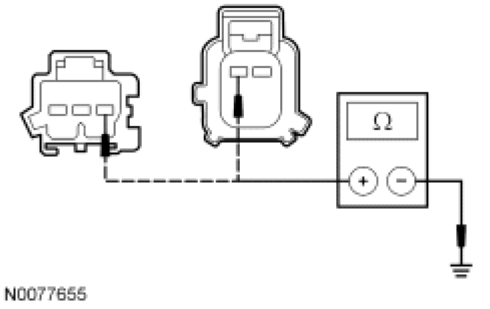

Fig. 29: Checking Circuit GD171 (BK/GY) For An Open (High Mounted Stoplamp)
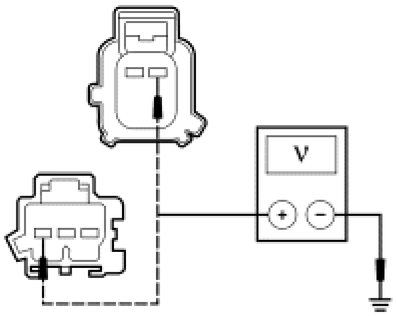
Courtesy of FORD MOTOR CO.

- Measure the resistance between the high mounted stoplamp C475-2 (parcel shelf) or C4111-3 (spoiler), circuit GD171 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to J3.

  NO : REPAIR the circuit. TEST the system for normal operation.

J3 CHECK CIRCUIT CLS17 (YE/GY) FOR VOLTAGE



N0077656

Fig. 30: Checking Circuit CLS17 (YE/GY) For Voltage
Courtesy of FORD MOTOR CO.

- While applying the brake pedal, measure the voltage between the high mounted stoplamp C475-1 (parcel shelf) or C4111-1 (spoiler), circuit CLS17 (YE/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

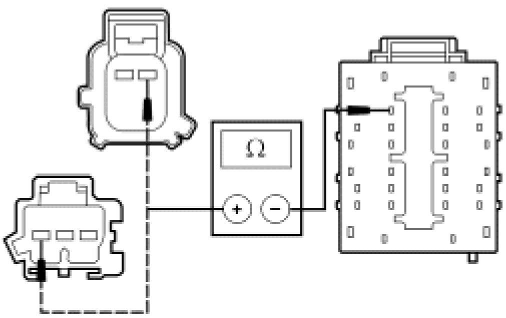
  YES : INSTALL a new high mounted stoplamp. REFER to **High Mounted Stoplamp**. TEST the system for normal operation.

  NO : For Fusion, go to J4.

  For Milan or MKZ, REPAIR circuit CLS17 (YE/GY) for an open. TEST the system for normal operation.

J4 CHECK CIRCUIT CLS17 (YE/GY) FOR AN OPEN (HIGH MOUNTED STOPLAMP)

- Disconnect: SJB C2280e



N0077654

Fig. 31: Checking Circuit CLS17 (YE/GY) For An Open (High Mounted Stoplamp)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the high mounted stoplamp C475-1 (parcel shelf) or C4111-1 (spoiler), circuit CLS17 (YE/GY), harness side and the SJB C2280e-26, circuit CLS17 (YE/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to J8.

  NO : REPAIR the circuit. TEST the system for normal operation.

J5 CHECK CIRCUIT GD171 (BK/GY) FOR AN OPEN (REAR STOPLAMP)

- Disconnect: Inoperative Rear Lamp
- Measure the resistance between the inoperative rear lamp, harness side and ground as follows:

Vehicle	Inoperative Stoplamp	Rear Lamp Connector-Pin	Circuit
Fusion	LH rear	C4035-1	GD171 (BK/GY)
Fusion	RH rear	C4032-1	GD171 (BK/GY)
Milan, MKZ	LH rear	C419-3	GD171 (BK/GY)
Milan, MKZ	RH rear	C418-3	GD171 (BK/GY)

- **Is the resistance less than 5 ohms?**

  YES : For Milan or MKZ, go to J6.

  For Fusion, go to J7.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

J6 CHECK CIRCUIT CLS17 (YE/GY) FOR AN OPEN (REAR STOPLAMP)

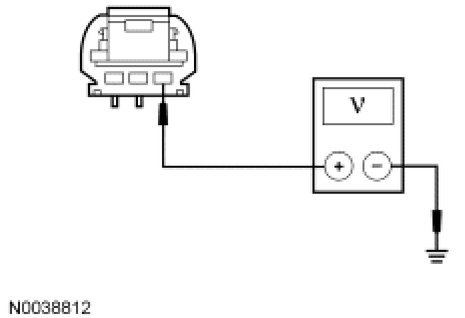


Fig. 32: Checking Circuit CLS17 (YE/GY) For Open (Rear Stoplamp)

Courtesy of FORD MOTOR CO.

- While applying the brake pedal, measure the voltage between the LH rear lamp C419-1, circuit CLS17 (YE/GY), harness side and ground; or between the RH rear lamp C418-1, circuit CLS17 (YE/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new rear lamp assembly. REFER to **Rear Lamp Assembly**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

J7 CHECK THE REAR STOPLAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN AND A SHORT TO GROUND

- Disconnect: SJB C2280e

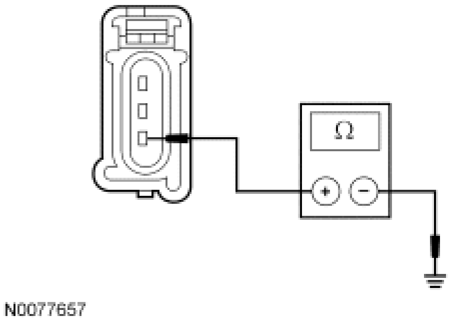

Fig. 33: Checking Rear Stoplamp Voltage Supply Circuit For An Open And A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative rear lamp, harness side and the SJB, harness side; and between the inoperative rear lamp, harness side and ground as follows:

Inoperative Stoplamp	Rear Lamp Connector-Pin	SJB Connector-Pin	Circuit
LH rear	C4035-3	C2280e-11	CLS18 (GY/BN)
RH rear	C4032-3	C2280e-7	CLS19 (VT/OG)

- **Is the resistance less than 5 ohms between the rear lamp and the SJB, and greater than 10,000 ohms between the rear lamp and ground?**

  YES : Go to J8.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

J8 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.

- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Stoplamp Are On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

When the brake pedal is applied, the stoplamp switch routes voltage to the smart junction box (SJB) and the PCM through circuit CCB08 (VT/WH).

Fusion

The voltage is then routed through the SJB to the high mounted stoplamp through circuit CLS17 (YE/GY). The SJB also supplies voltage to the LH and RH rear stoplamp through circuits CLS18 (GY/BN) and CLS19 (VT/OG), respectively.

Milan, MKZ

The voltage is then routed through the SJB to the stoplamp through circuit CLS17 (YE/GY).

The rear lamps contain electronics that modulate the voltage frequency to the LED bulbs.

- DTC B1485 (Brake Pedal Input Short to Battery) - is an on-demand DTC that sets when the SJB detects a short to voltage from the stoplamp switch input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stoplamp switch
- PCM
- SJB

PINPOINT TEST K: THE STOPLAMP ARE ON CONTINUOUSLY

K1 DETERMINE IF ALL THE STOPLAMP ARE ILLUMINATED

- Key in OFF position.
- Observe the stoplamp with the brake pedal released.
- **Are all of the stoplamp illuminated?**

YES : Go to K2.

NO : Go to K7.

K2 CHECK THE STOPLAMP SWITCH

- Disconnect: Stoplamp Switch C278
- **Do the stoplamp continue to illuminate?**

YES : Go to K3.

NO : INSTALL a new stoplamp switch. REFER to **Stoplamp Switch**. CLEAR the DTCs. REPEAT the self-test.

K3 CHECK THE PCM

- Disconnect: PCM C175b
- **Do the stoplamp continue to illuminate?**

YES : Go to K4.

NO : Go to K8.

K4 CHECK CIRCUIT CCB08 (VT/WH) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280a
- **Do the stoplamp continue to illuminate?**

YES : For Fusion, go to K5.

For Milan or MKZ, go to K6.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

K5 CHECK THE SJB

- Disconnect: SJB C2280c
- **Do the stoplamp continue to illuminate?**

YES : Go to K6.

NO : Go to K9.

K6 CHECK CIRCUIT CLS17 (YE/GY) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280e
- **Does the high mounted stoplamp continue to illuminate?**

YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

NO : Go to K9.

K7 CHECK THE STOPLAMP VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280e

- **Do the stoplamp continue to illuminate?**

  YES : If the LH rear lamp continues to illuminate, REPAIR circuit CLS18 (GY/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

  If the RH rear lamp continues to illuminate, REPAIR circuit CLS19 (VT/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to K9.

K8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

K9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

TURN SIGNAL AND HAZARD LAMPS

Special Tools

Illustration	Tool Name	Tool Number

 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1436-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the multifunction switch position by sending multiple voltage reference signals to the multifunction switch. When the multifunction switch is in the LH or RH TURN positions, or the hazard flasher lamp switch is engaged, that input signal is routed to ground.

When the SJB receives a request for a turn signal or hazard lamps, the SJB supplies voltage to the appropriate turn lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Multifunction switch • Hazard flasher lamp switch	• Bulb(s) • Wiring, terminals or connectors • Smart junction box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1799	Lamp Turn Signal Front Output Circuit Open	Go to **Pinpoint Test N**.
B1801	Lamp Turn Signal Front Output Circuit Short to Ground	Go to **Pinpoint Test N**.

All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Fuse(s) • Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The turn signal lamps are inoperative	• Wiring, terminals or connectors • Multifunction switch • SJB	• Go to **Pinpoint Test L**.
• The turn signal lamps are always on	• Wiring, terminals or connectors • Multifunction switch • SJB	• Go to **Pinpoint Test M**.
• One turn signal/hazard lamp is inoperative/always on	• Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test N**.
• The hazard lamps are inoperative/always on	• Wiring, terminals or connectors • Hazard flasher lamp switch • SJB	• Go to **Pinpoint Test O**.

Pinpoint Tests

Pinpoint Test L: The Turn Signal Lamps Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends reference signals to the multifunction switch through circuits CLS39 (VT/WH) (LH turn input) and CLS41 (GY/YE) (RH turn input). When the multifunction switch is switched to the LH or RH TURN positions, the voltage signal is routed to ground. When the SJB detects the multifunction switch in the LH or RH TURN position, the SJB provides on/off voltage to the appropriate turn lamps.

All the turn lamps are individually wired to the SJB. The timed on/off cycle is determined by the SJB and is set to flash approximately 80 times per minute if both, front and rear, turn lamps operate correctly. If an individual turn signal lamp is inoperative, the SJB flashes the remaining turn lamp approximately 160 times per minute.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST L: THE TURN SIGNAL LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

L1 CHECK FOR CORRECT HIGH BEAM OPERATION

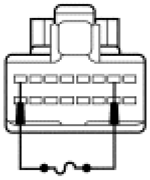
- Place the headlamp switch in the HEADLAMPS ON position.
- Place the multifunction switch in the HIGH BEAM position while observing the high beam headlamps.
- **Do the high beams operate correctly?**

  YES : PLACE the headlamp switch in the OFF position. Go to L2.

  NO : REFER to **Headlamps**.

L2 CHECK THE MULTIFUNCTION SWITCH

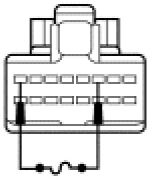
- Key in OFF position.
- Disconnect: Multifunction Switch C202



N0069012

Fig. 34: Connecting Fused (5A) Jumper Wire Between Multifunction Switch C202-2 & C202-8, CLS39 (VT/WH) & GD116 (BK/VT)
Courtesy of FORD MOTOR CO.

- For an inoperative LH turn signal, connect a fused (5A) jumper wire between the multifunction switch C202-2, circuit CLS39 (VT/WH), harness side and the multifunction switch C202-8, circuit GD116 (BK/VT), harness side.



N0069013

Fig. 35: Connecting Fused (5A) Jumper Wire Between Multifunction Switch C202-3, CLS41 (GY/YE) & GD116 (BK/VT)
Courtesy of FORD MOTOR CO.

- For an inoperative RH turn signal, connect a fused (5A) jumper wire between the multifunction switch C202-3, circuit CLS41 (GY/YE), harness side and the multifunction switch C202-3, circuit GD116 (BK/VT), harness side.
- Key in ON position.
- **Do the turn signals in question flash on and off?**

  YES : REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

  NO : REMOVE the jumper wire. Go to L3.

L3 CHECK CIRCUIT CLS39 (VT/WH) (LH TURN SIGNAL) OR CIRCUIT CLS41 (GY/YE) (RH TURN SIGNAL) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280d

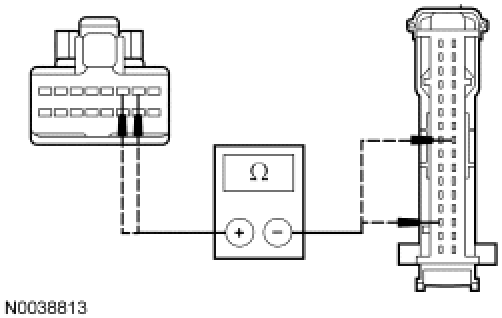


Fig. 36: Checking Circuit CLS39 (VT/WH) (LH Turn Signal) Or CLS41 (GY/YE) (RH Turn Signal) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the multifunction switch C202-2 (LH turn lamps), circuit CLS39 (VT/WH), harness side and the SJB C2280d-14, circuit CLS39 (VT/WH), harness side; or between the multifunction switch C202-3 (RH turn lamps), circuit CLS41 (GY/YE), harness side and the SJB C2280d-24, circuit CLS41 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to L4.

  NO : REPAIR the circuit. TEST the system for normal operation.

L4 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: The Turn Signal Lamps Are Always On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage reference signals to the multifunction switch through circuits CLS39 (VT/WH) (LH turn input) and CLS41 (GY/YE) (RH turn input). When the multifunction switch is switched to the LH or RH TURN positions, the voltage signal is routed to ground. When the SJB detects the multifunction switch in the LH or RH TURN position, the SJB provides on/off voltage to the appropriate turn lamps.

- DTC B2281 (Right turn switch short to ground) - is an on-demand DTC that sets when the SJB detects the RH turn signal switch input is short to ground.
- DTC B2282 (Left turn switch short to ground) - is an on-demand DTC that sets when the SJB detects the LH turn signal switch input is short to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST M: THE TURN SIGNAL LAMPS ARE ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

M1 CHECK THE MULTIFUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multifunction Switch C202
- Key in ON position.
- **Do the turn lamps continue to flash on and off?**

  YES : Go to M2.

  NO : INSTALL a new multifunction switch. REFER to **STEERING COLUMN SWITCHES** article. CLEAR the DTCs. REPEAT the self-test.

M2 CHECK CIRCUIT CLS39 (VT/WH) (LH TURN SIGNAL) OR CIRCUIT CLS41 (GY/YE) (RH TURN SIGNAL) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280d

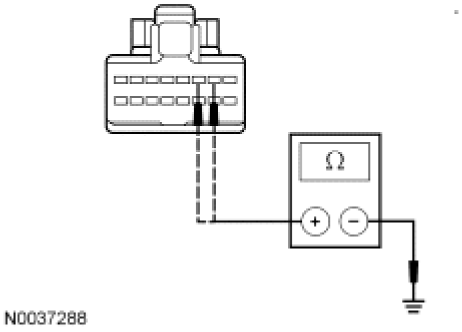

Fig. 37: Checking Circuit CLS39 (VT/WH) (LH Turn Signal) Or Circuit CLS41 (GY/YE) (RH Turn Signal) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the multifunction switch C202-2 (LH turn lamps), circuit CLS39 (VT/WH), harness side and ground; or between the multifunction switch C202-3 (RH turn lamps), circuit CLS41 (GY/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to M3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

M3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test N: One Turn Signal/Hazard Lamp Is Inoperative/Always On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation - Fusion

When the smart junction box (SJB) detects the multifunction switch in the LH TURN position, the SJB provides on/off voltage through circuit CLS21 (BU/GN) to the LH front turn lamp. When the SJB detects the

multifunction switch in the RH TURN position, the SJB provides on/off voltage through circuit CLS25 (YE/VT) to the RH front turn lamp. Circuits GD123 (BK/GY) and GD121 (BK/YE) provide ground for the LH and RH front turn lamps, respectively. The rear turn lamps are controlled utilizing the rear stoplamp circuitry.

Milan, MKZ

When the SJB detects the multifunction switch in the LH TURN position, the SJB provides on/off voltage through circuit CLS21 (BU/GN) to the LH front turn lamp, and through circuit CLS18 (GY/BN) to the LH rear turn lamp. When the SJB detects the multifunction switch in the RH TURN position, the SJB provides on/off voltage through circuit CLS25 (YE/VT) to the RH front turn lamp, and through circuit CLS19 (VT/OG) to the RH rear turn lamp. Circuits GD123 (BK/GY) and GD121 (BK/YE) provide ground for the LH and RH front turn lamps, respectively. Circuit GD171 (BK/GY) provides ground for the rear turn lamps.

For MKZ vehicles equipped with daytime running lamps (DRL), the front turn lamps are utilized as the DRL.

DTC Description	Fault Trigger Conditions
B1799 - Lamp Turn Signal Front Output Circuit Open	A continuous DTC that sets when the SJB detects an open on either front turn lamp voltage supply circuit.
B1801 - Lamp Turn Signal Front Output Circuit Short To Ground	A continuous DTC that sets when the SJB detects a short to ground on either front turn lamp voltage supply circuit.
B2048 - Left Rear Turn Lamp Circuit Short to Ground	A continuous DTC that sets when the SJB detects a short to ground on the LH rear stop/turn lamp voltage supply circuit.
B2049 - Left Rear Turn Lamp Circuit Open	A continuous DTC that sets when the SJB detects an open on the LH rear stop/turn lamp voltage supply circuit.
B2050 - Right Rear Turn Lamp Circuit Short to Ground	A continuous DTC that sets when the SJB detects a short to ground on the RH rear stop/turn lamp voltage supply circuit.
B2051 - Right Rear Turn Lamp Circuit Open	A continuous DTC that sets when the SJB detects an open on the RH rear stop/turn lamp voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST N: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

N1 DETERMINE IF A TURN LAMP IS ALWAYS ON

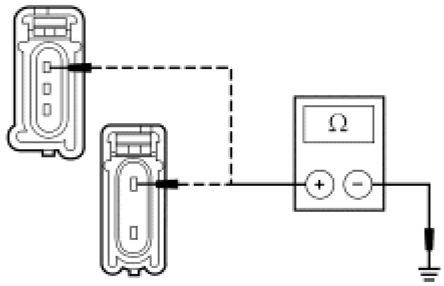
- Key in ON position.
- Monitor the turn lamps while placing the multifunction switch in the RH TURN, LH TURN and NEUTRAL positions.
- **Is any turn lamp always on?**

  YES : Go to N4.

  NO : Go to N2.

N2 CHECK THE TURN LAMP GROUND CIRCUITRY FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Turn Lamp



N0077658

Fig. 38: Checking Turn Lamp Ground Circuitry For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative turn lamp, harness side and ground as follows:

Inoperative Turn Lamp	Connector-Pin	Circuit
LH front	C1023-1	GD123 (BK/GY)
RH front	C1043-1	GD121 (BK/YE)
LH rear (Milan, MKZ)	C413-1	GD171 (BK/GY)
RH rear (Milan, MKZ)	C416-1	GD171 (BK/GY)

- **Is the resistance less than 5 ohms?**

  YES : Go to N3.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

N3 CHECK THE TURN LAMP VOLTAGE SUPPLY CIRCUITRY FOR AN OPEN AND A SHORT TO GROUND

- Disconnect: SJB C2280e (Rear Lamp) or C2280a (Front Lamp)
- Measure the resistance between the inoperative turn lamp, harness side and the SJB, harness side; and between the inoperative turn lamp, harness side and ground as follows:

Inoperative Turn Lamp Connector-Pin	SJB Connector-Pin	Circuit
LH front C1023-3	C2280a-21	CLS21 (BU/GN)
RH front C1043-3	C2280a-9	CLS25 (YE/VT)
LH rear (Milan, MKZ) C413-3	C2280e-11	CLS18 (GY/BN)
RH rear (Milan, MKZ) C416-3	C2280e-7	CLS19 (VT/OG)

- **Is the resistance less than 5 ohms between the inoperative turn lamp and the SJB, and greater than 10,000 ohms between the inoperative turn lamp and ground?**

  YES : Go to N5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

N4 CHECK THE TURN LAMP VOLTAGE SUPPLY CIRCUITRY FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280e (Rear Lamp) or C2280a (Front Lamp)
- Key in ON position.
- **Does the turn lamp in question continue to illuminate?**

  YES : For the LH front turn lamp, REPAIR circuit CLS21 (BU/GN). CLEAR the DTCs. REPEAT the self-test.

  For the RH front turn lamp, REPAIR circuit CLS25 (YE/VT). CLEAR the DTCs. REPEAT the self-test.

  For the LH rear turn lamp, REPAIR circuit CLS18 (GY/BN). CLEAR the DTCs. REPEAT the self-test.

  For the RH rear turn lamp, REPAIR circuit CLS19 (VT/OG). CLEAR the DTCs. REPEAT the self-test.

NO : Go to N5.

N5 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test O: The Hazard Lamps Are Inoperative/Always On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a voltage reference signal to the hazard flasher lamp switch through circuit CLS32 (BN/YE). When the hazard flasher lamp switch is pressed, the voltage signal is routed to ground through circuit GD116 (BK/VT). When the SJB detects a request for the hazard lamps, the SJB provides on/off voltage to the all the turn lamps.

The hazard flasher lamp switch is a momentary contact switch.

- DTC B1875 (Turn Signal/Hazard Switch Signal Circuit Failure) - is an on-demand DTC that sets when the SJB detects a short to ground from the hazard flasher lamp switch input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Hazard flasher lamp switch
- SJB

PINPOINT TEST O: THE HAZARD LAMPS ARE INOPERATIVE/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

O1 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST

- Key in OFF position.
- Retrieve the recorded results from the SJB self-test.
- **Is DTC B1875 present?**

  YES : Go to O2.

  NO : Go to O4.

O2 CHECK THE HAZARD FLASHER LAMP SWITCH (DTC B1875)

- Disconnect: Hazard Flasher Lamp Switch C2355
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB Self-Test
- Clear the DTCs and repeat the SJB on-demand self-test.
- **Is DTC B1875 still present?**

  YES : Go to O3.

  NO : INSTALL a new hazard flasher lamp switch. REFER to **Hazard Flasher Lamp Switch**. TEST the system for normal operation.

O3 CHECK CIRCUIT CLS32 (BN/YE) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280d

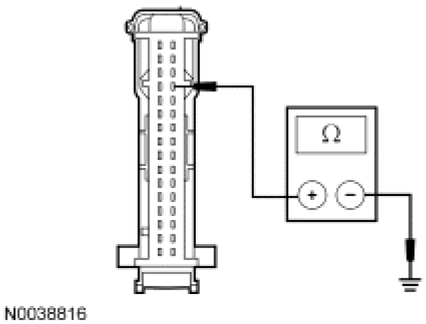


Fig. 39: Checking Hazard Lamp Switch
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-20, circuit CLS32 (BN/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to O7.

  NO : REPAIR the circuit. TEST the system for normal operation.

O4 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.
- Disconnect: Hazard Flasher Lamp Switch C2355

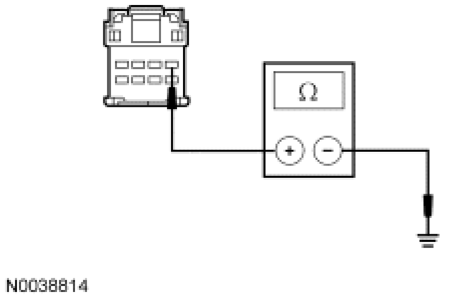

Fig. 40: Checking Circuit GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the hazard flasher lamp switch C2355-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O5.

  NO : REPAIR the circuit. TEST the system for normal operation.

O5 CHECK CIRCUIT CLS32 (BN/YE) FOR AN OPEN

- Disconnect: SJB C2280d

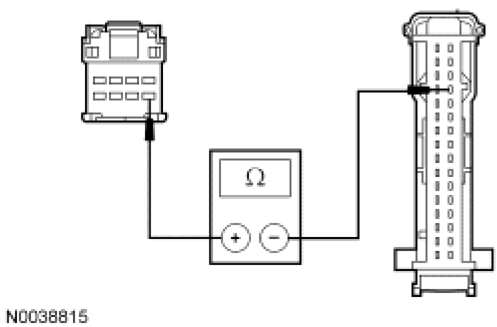

Fig. 41: Checking Circuit CLS32 (BN/YE) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the hazard flasher lamp switch C2355-5, circuit CLS32 (BN/YE), harness side and the SJB C2280d-20, circuit CLS32 (BN/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to O6.

  NO : REPAIR the circuit. TEST the system for normal operation.

O6 CHECK THE HAZARD FLASHER LAMP SWITCH

- Connect: Hazard Flasher Lamp Switch C2355

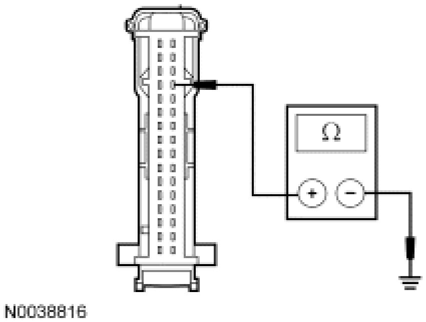

Fig. 42: Checking Hazard Lamp Switch
Courtesy of FORD MOTOR CO.

- While holding the hazard flasher lamp switch pressed, measure the resistance between the SJB C2280d-20, circuit CLS32 (BN/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O7.

  NO : INSTALL a new hazard flasher lamp switch. REFER to **Hazard Flasher Lamp Switch**. TEST the system for normal operation.

O7 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PARKING, REAR AND LICENSE PLATE LAMPS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent

 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1438-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB detects any concern with the inputs from the headlamp switch for 5 seconds, the SJB may turn on the exterior lights and keep them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB detects any headlamp switch input concern if the ignition switch was already off).

If the SJB detects a concern with the headlamp switch inputs, the SJB implements a planned strategy depending on the inputs received. If this situation occurs, the SJB should **NOT** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

When the SJB receives an input from the headlamp switch indicating a request for the parking lamps, the SJB energizes the parking lamp relay, which supplies voltage to the exterior lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Headlamp switch	• Smart junction box (SJB) fuse 4 (15A) (parking lamps) • Bulb(s) • Wiring, terminals or connectors • Rear lamp assembly • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1578	Lamp Park Input Circuit Short to Ground	REFER to **Headlamps**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Fuse(s) • Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• One or more parking, rear or license plate lamps is inoperative	• Fuse • Wiring, terminals or connectors • Rear lamp assembly • SJB	• Go to **Pinpoint Test P**.
• The parking, rear or license plate lamps are on continuously	• Wiring, terminals or connectors • Headlamp switch • SJB	• Go to **Pinpoint Test Q**.

Pinpoint Tests

Pinpoint Test P: One Or More Parking, Rear or License Plate Lamps Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

When the headlamp switch is placed in the PARKING LAMPS ON position, the SJB provides a ground for the parking lamp relay coil (internal to the SJB). When the parking lamp relay is energized, voltage is sent through circuit CBP08 (GY/YE) to the rear and front parking lamps. Ground is provided to the rear parking and license plate lamps through circuit GD171 (BK/GY). Ground is provided to the front parking and side marker lamps through circuits GD121 (BK/YE) or GD123 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Rear lamp assembly
- SJB

PINPOINT TEST P: ONE OR MORE PARKING, REAR OR LICENSE PLATE LAMPS IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

P1 CHECK THE STOPLAMP AND TURN LAMPS

- Key in ON position.
- Operate the turn signals and apply the brake pedal while observing the exterior lamps.
- **Do the stoplamp and turn lamps operate correctly?**

  YES : Go to P2.

  NO : REFER to **Stoplamp** or **Turn Signal and Hazard Lamps**.

P2 DETERMINE IF ALL THE PARKING LAMPS ARE INOPERATIVE

- Key in OFF position.
- Place the headlamp switch to the PARKING LAMPS ON position.
- **Are all the parking lamps inoperative?**

  YES : PLACE the headlamp switch in the OFF position. VERIFY the SJB fuse 4 (15A) is OK. If OK, go to P7.

  NO : PLACE the headlamp switch in the OFF position.

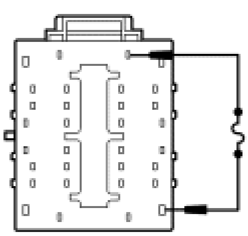
  If all front parking lamps are inoperative, go to P3.

  If all rear parking and license plate lamps are inoperative, go to P4.

  If an individual parking or license plate lamp is inoperative, go to P5.

P3 CHECK CIRCUIT CBP08 (GY/YE) FOR AN OPEN (FRONT LAMPS)

- Disconnect: SJB C2280a



N0038818

Fig. 43: Checking Circuit CBP08 (GY/YE) For Open (Front Lamps)
Courtesy of FORD MOTOR CO.

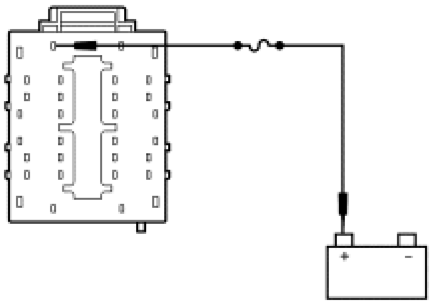
- Connect a fused (10A) jumper wire between the SJB C2280a-4, circuit SBB19 (RD/BU), harness side and the SJB C2280a-31, circuit CBP08 (GY/YE), harness side
- **Do the front parking lamps illuminate?**

  YES : REMOVE the jumper wire. Go to P7.

NO : REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.

P4 CHECK CIRCUIT CBP08 (GY/YE) FOR AN OPEN (REAR LAMPS)

- Disconnect: SJB C2280e



N0038819

Fig. 44: Checking Circuit CBP08 (GY/YE) For Open (Rear Lamps)
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between the positive battery terminal and the SJB C2280e-30, circuit CBP08 (GY/YE), harness side.
- **Do the rear parking lamps illuminate?**

  YES : REMOVE the jumper wire. Go to P7.

  NO : REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.

P5 CHECK THE PARKING LAMP GROUND CIRCUIT FOR AN OPEN

- Disconnect: Inoperative Lamp
- Measure the resistance between the inoperative lamp, harness side and ground as follows:

FUSION

Inoperative Lamp	Connector-Pin	Circuit
LH front	C1023-1	GD123 (BK/GY)
RH front	C1043-1	GD121 (BK/YE)

LH license plate	C452-2	GD171 (BK/GY)
RH license plate	C462-2	GD171 (BK/GY)

- **Is the resistance less than 5 ohms?**

  YES : For a rear lamp on Milan or MKZ, go to P6.

  For all others, REPAIR circuit CBP08 (GY/YE) for an open. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

P6 CHECK CIRCUIT CBP08 (GY/YE) FOR AN OPEN

- Place the headlamp switch in the PARKING LAMPS ON position.

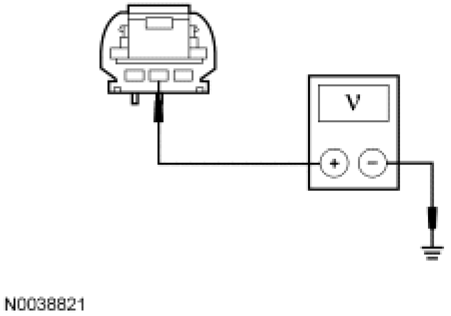

Fig. 45: Checking Circuit CBP08 (GY/YE) For Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the LH rear lamp C419-2, circuit CBP08 (GY/YE), harness side and ground; or between the RH rear lamp C418-2, circuit CBP08 (GY/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new rear lamp assembly. REFER to **Rear Lamp Assembly**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

P7 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Q: The Parking, Rear Or License Plate Lamps Are On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides a ground for the parking lamp relay coil when a request for the parking lamps is received. When the parking lamp relay is energized, voltage is sent through circuit CBP08 (GY/YE) to the rear and front parking lamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp switch
- SJB

PINPOINT TEST Q: THE PARKING, REAR OR LICENSE PLATE LAMPS ARE ON CONTINUOUSLY

Q1 CHECK CIRCUIT CBP08 (GY/YE) FOR A SHORT TO VOLTAGE (TO REAR LAMPS)

- Disconnect: SJB C2280e
- **Do the rear parking lamps continue to illuminate?**

YES : REPAIR the circuit. TEST the system for normal operation.

NO : Go to Q2.

Q2 CHECK CIRCUIT CBP08 (GY/YE) FOR A SHORT TO VOLTAGE (TO FRONT LAMPS)

- Disconnect: SJB C2280a
- **Do the front parking lamps continue to illuminate?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to Q3.

Q3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

FOG LAMPS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1438-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the headlamp switch position by sending a voltage reference signal to the headlamp switch. When the fog lamp switch is engaged, the voltage reference signal is routed to ground.

The fog lamps can be turned on when the following pre-conditions are met:

- The ignition switch is in the RUN or START position
- The parking lamps are on
- The high beams are off

When the SJB receives an input from the headlamp switch indicating a request for the fog lamps (and the pre-conditions are met), the SJB provides voltage to the fog lamp relay. When the fog lamp relay is energized, voltage is routed to the fog lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Battery junction box (BJB) fuse 24 (15A) (fog lamp relay) • Bulb(s) • Fog lamp relay • Wiring, terminals or connectors • Headlamp switch • Smart junction box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
    - Check the VCM connection to the vehicle.
    - Check the scan tool connection to the VCM.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - Verify the ignition key is in the ON position.
    - Verify the scan tool operation with a known good vehicle.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

• An individual fog lamp is inoperative	• Wiring, terminals or connectors	• Go to **Pinpoint Test S**.
• The fog lamps are on continuously	• Wiring, terminals or connectors • Fog lamp relay • Headlamp switch • SJB	• Go to **Pinpoint Test T**.

Pinpoint Tests

Pinpoint Test R: The Fog Lamps Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Fog Lamps for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Fuse and Relay Information for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the headlamp switch through circuit CLF21 (GY/VT). When the fog lamp switch is engaged, the voltage signal is routed to ground.

Voltage is supplied to the switched side of the fog lamp relay from the battery junction box (BJB) fuse 24 (15A) through circuit SBB24 (VT/RD).

When the SJB detects the fog lamps on request, the SJB provides voltage to the fog lamp relay coil through circuit CLF29 (BN). The fog lamp relay coil ground is provided through circuit GD121 (BK/YE). When the fog lamp relay is energized, voltage is routed through circuit CLF12 (BN/YE) to the fog lamps.

- DTC B2030 (Front Fog Lamp Relay CKT Failure) - is a continuous DTC that sets when the SJB detects a short to ground on the fog lamp relay coil voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors

- Fog lamp relay
- Headlamp switch
- SJB

PINPOINT TEST R: THE FOG LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

R1 CHECK THE HEADLAMP SWITCH PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB headlamp switch (FOG SW) PID while engaging the fog lamp switch.
- **Does the PID indicate the fog lamp switch is active?**

  YES : Go to R4.

  NO : Go to R2.

R2 CHECK THE HEADLAMP SWITCH

- Key in OFF position.
- Disconnect: Headlamp Switch C205
- Carry out the headlamp switch component test. Refer to COMPONENT TESTING.
- **Is the headlamp switch OK?**

  YES : Go to R3.

  NO : INSTALL a new headlamp switch. REFER to **Headlamp Switch**. TEST the system for normal operation.

R3 CHECK CIRCUIT CLF21 (GY/VT) FOR AN OPEN

- Disconnect: SJB C2280d

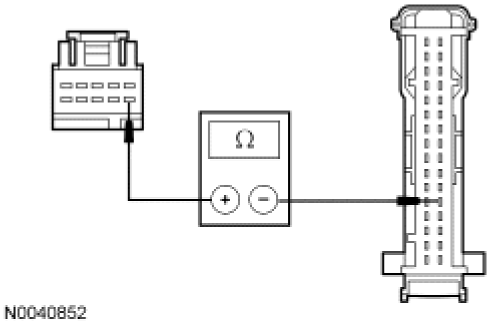

Fig. 46: Checking Circuit CLF21 (GY/VT) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the headlamp switch C205-6, circuit CLF21 (GY/VT), harness side and the SJB C2280d-28, circuit CLF21 (GY/VT), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to R10.

  NO : REPAIR the circuit. TEST the system for normal operation.

R4 CHECK THE FOG LAMP RELAY

- Key in OFF position.
- Disconnect: Fog Lamp Relay
- Substitute a known good relay and recheck the fog lamp operation.
- **Do the fog lamps operate correctly?**

  YES : REMOVE the known good relay. INSTALL a new fog lamp relay. CLEAR the DTCs. REPEAT the self-test.

  NO : REMOVE the known good relay. Go to R5.

R5 CHECK CIRCUIT CLF29 (BN) FOR VOLTAGE

- Key in ON position.
- Place the headlamp switch in the HEADLAMPS ON position and engage the fog lamp switch.

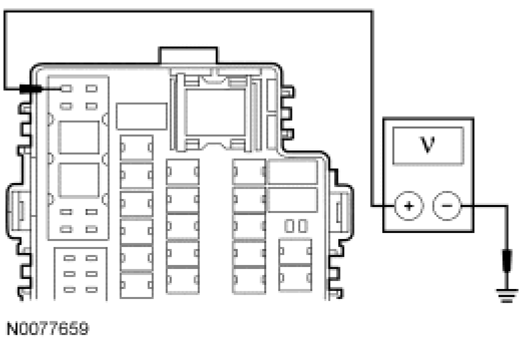

Fig. 47: Checking Circuit CLF29 (BN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the fog lamp relay pin 86, circuit CLF29 (BN), BJB face side and ground.
- **Is the voltage greater than 10 volts?**

  YES : PLACE the headlamp switch in the OFF position. Go to R8.

  NO : PLACE the headlamp switch in the OFF position. Go to R6.

R6 CHECK CIRCUIT CLF29 (BN) FOR AN OPEN AND SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280a

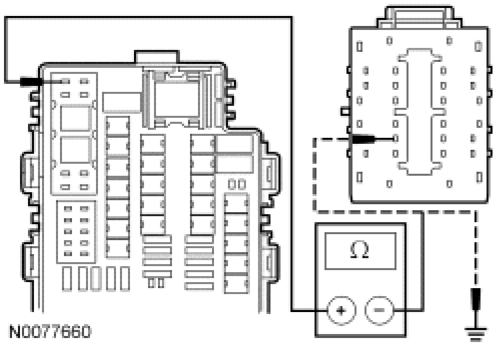

Fig. 48: Checking Circuit CLF29 (BN) For An Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the fog lamp relay pin 86, circuit CLF29 (BN), BJB face side and the SJB C2280a-10, circuit CLF29 (BN), harness side; and between the fog lamp relay pin 86, circuit CLF29 (BN), BJB face side and ground.
- **Is the resistance less than 5 ohms between the fog lamp relay and the SJB, and greater than 10,000 ohms between the fog lamp relay and ground?**

  YES : Go to R7.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

R7 CHECK CIRCUIT CLF28 (BN/WH) FOR A SHORT TO GROUND

- Disconnect: SJB C2280d
- Disconnect: Headlamp Switch C205

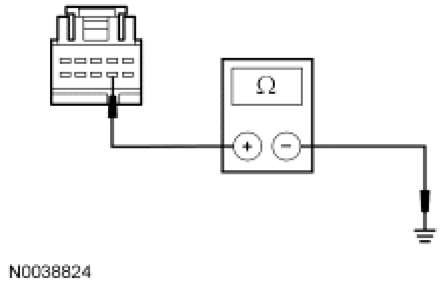

Fig. 49: Checking Circuit CLF28 (BN/WH) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the headlamp switch C205-7, circuit CLF28 (BN/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to R10.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

R8 CHECK CIRCUIT SBB24 (VT/RD) FOR AN OPEN

- Key in OFF position.

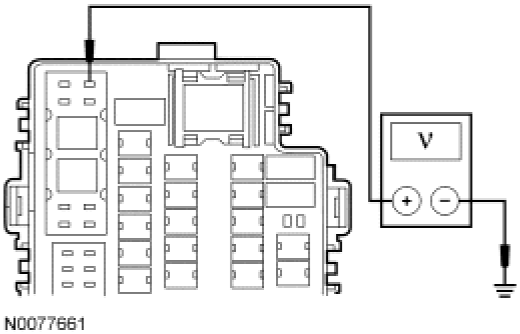

Fig. 50: Checking Circuit SBB24 (VT/RD) For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the fog lamp relay pin 30, circuit SBB24 (VT/RD), BJB face side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to R9.

  NO : VERIFY the BJB fuse 24 (15A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

R9 CHECK CIRCUIT GD121 (BK/YE) FOR AN OPEN

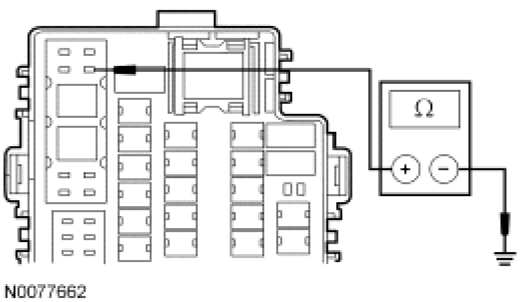

Fig. 51: Checking Circuit GD121 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the fog lamp relay pin 85, circuit GD121 (BK/YE), BJB face side and ground.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR circuit CLF12 (BN/YE). CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. REPEAT the self-test.

R10 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins

  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test S: An Individual Fog Lamp Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Fog Lamps for schematic and connector information.

Normal Operation

When the fog lamp relay is energized, voltage is routed through circuit CLF12 (BN/YE) to the fog lamps. Ground is provided on circuits GD121 (BK/YE) and GD123 (BK/GY) to the LH and RH fog lamps, respectively.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

PINPOINT TEST S: AN INDIVIDUAL FOG LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Make sure the fog lamp bulb is good before carrying out diagnostics.

S1 CHECK THE GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Fog Lamp

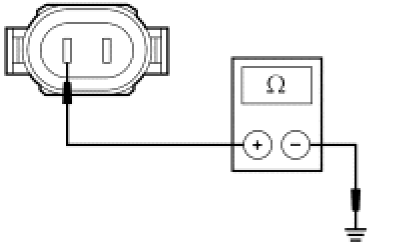

Fig. 52: Checking Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH fog lamp C152-B, circuit GD121 (BK/YE), harness side and ground; or between the RH fog lamp C162-B, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR circuit CLF12 (BN/YE) for an open. TEST the system for normal operation.

  NO : REPAIR circuit GD121 (BK/YE) or circuit GD123 (BK/GY) for an open as necessary. TEST the system for normal operation.

Pinpoint Test T: The Fog Lamps Are On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Fog Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the headlamp switch through circuit CLF21 (GY/VT). When the fog lamp switch is engaged, the voltage signal is routed to ground.

When the SJB detects the fog lamps on request, the SJB provides voltage to the fog lamp relay coil through circuit CLF29 (BN). When the fog lamp relay is energized, voltage is routed through circuit CLF12 (BN/YE) to the fog lamps.

- DTC B2254 (Front Fog Lamp Switch Failure) - is an on-demand DTC that sets when the SJB detects a short to ground on the fog lamp on input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Fog lamp relay
- Headlamp switch
- SJB

PINPOINT TEST T: THE FOG LAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

T1 RETRIEVE THE RECORDED RESULTS FROM THE SJB ON-DEMAND SELF-TEST

- Key in OFF position.
- Retrieve the recorded results from the SJB self-test.
- **Is DTC B2254 present?**

  YES : Go to T2.

  NO : Go to T4.

T2 CHECK THE HEADLAMP SWITCH

- Disconnect: Headlamp Switch C205
- Carry out the headlamp switch component test. Refer to COMPONENT TESTING.
- **Is the headlamp switch OK?**

  YES : Go to T3.

  NO : INSTALL a new headlamp switch. REFER to **Headlamp Switch**. CLEAR the DTCs. REPEAT the self-test.

T3 CHECK CIRCUIT CLF21 (GY/VT) FOR A SHORT TO GROUND

- Disconnect: SJB C2280d

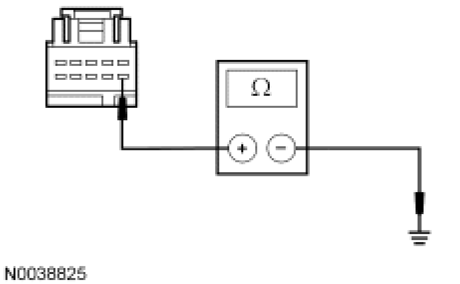

Fig. 53: Checking Circuit CLF21 (GY/VT) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the headlamp switch C205-6, circuit CLF21 (GY/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to T9.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

T4 CHECK CIRCUIT CLF12 (BN/YE) FOR A SHORT TO VOLTAGE

- Disconnect: Fog Lamp Relay
- **Do the fog lamps continue to illuminate?**

  YES : REPAIR the circuit. TEST the system for normal operation.

NO : Go to T5.

T5 CHECK THE FOG LAMP RELAY

- Carry out the fog lamp relay component test. Refer to COMPONENT TESTING.
- **Is the fog lamp relay OK?**

  YES : Go to T6.

  NO : INSTALL a new fog lamp relay. TEST the system for normal operation.

T6 CHECK THE HEADLAMP SWITCH (SHORT TO VOLTAGE)

- Connect: Fog Lamp Relay
- Disconnect: Headlamp Switch C205
- **Do the fog lamps continue to illuminate?**

  YES : Go to T7.

  NO : INSTALL a new headlamp switch. REFER to **Headlamp Switch**. TEST the system for normal operation.

T7 CHECK CIRCUIT CLF29 (BN) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280a
- **Do the fog lamps continue to illuminate?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to T8.

T8 CHECK CIRCUIT CLF28 (BN/WH) FOR A SHORT TO VOLTAGE

- Connect: SJB C2280a
- Disconnect: SJB C2280d
- **Do the fog lamps continue to illuminate?**

  YES : Go to T9.

  NO : REPAIR the circuit. TEST the system for normal operation.

T9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

REVERSING LAMPS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1438-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

For vehicles equipped with an automatic transaxle, the transmission control module (TCM) sends gear status information (through the instrument cluster [IC] gateway) to the SJB over the communication network. When the ignition switch is in the RUN position and a message is sent over the communication network stating the transaxle is in REVERSE (R), the SJB energizes an internal relay which supplies voltage to the reversing lamps.

For vehicles equipped with a manual transaxle, the SJB supplies voltage to the reversing lamp switch when the ignition switch is in the RUN position. When the transaxle is placed in REVERSE (R), the switch routes the voltage to the reversing lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
	• Smart junction box (SJB) fuse: ○ 1 (10A) (reversing lamps) (automatic transaxle)

• Reversing lamp switch (manual transaxle)	◦ 26 (7.5A) (reversing lamp switch) (manual transaxle) • Bulb(s) • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
    - Check the VCM connection to the vehicle.
    - Check the scan tool connection to the VCM.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - Verify the ignition key is in the ON position.
    - Verify the scan tool operation with a known good vehicle.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the transmission control module (TCM).
9. If the DTCs retrieved are related to the concern, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.

10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the transmission control module (TCM)	• Fuse(s) • Wiring, terminals or connectors • TCM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The reversing lamps are inoperative	• Fuse • Wiring, terminals or connectors • Reversing lamp switch • SJB	• Go to **Pinpoint Test U**.
• An individual reversing lamp is inoperative	• Wiring, terminals or connectors	• Go to **Pinpoint Test V**.
• The reversing lamps are on continuously	• Wiring, terminals or connectors • Reversing lamp switch • Rear view mirror • SJB	• Go to **Pinpoint Test W**.

Pinpoint Tests

Pinpoint Test U: The Reversing Lamps Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Reversing Lamps for schematic and connector information.

Normal Operation - Automatic Transaxle

When the transaxle is placed in REVERSE (R), the transmission control module (TCM) sends gear status information (through the instrument cluster [IC] gateway) to the smart junction box (SJB). When the SJB receives a message indicating the transaxle is in REVERSE (R), the SJB provides ground to an internal relay, which routes the voltage to circuit CBP12 (GN/WH) to the reversing lamps.

Manual Transaxle

Voltage is supplied to the reversing lamp switch through circuit CBP18 (GY/OG). When the transaxle is placed in REVERSE (R), the reversing lamp switch routes the voltage to circuit CBP12 (GN/WH) to the reversing

lamps.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Reversing lamp switch
- SJB

PINPOINT TEST U: THE REVERSING LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

U1 CHECK THE TRANSAXLE TYPE

- Key in OFF position.
- Check the transaxle type on the vehicle.
- **Is the vehicle equipped with a manual transaxle?**

  YES : Go to U2.

  NO : Go to U4.

U2 CHECK CIRCUIT CBP18 (GY/OG) FOR AN OPEN

- Disconnect: Reversing Lamp Switch C169
- Key in ON position.

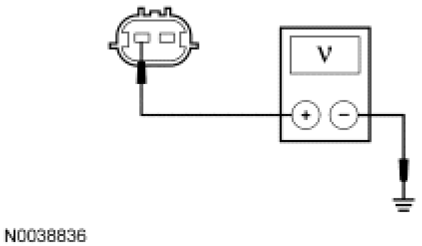

Fig. 54: Checking Circuit CBP18 (GY/OG) For Open
Courtesy of FORD MOTOR CO.

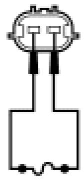
- Measure the voltage between the reversing lamp switch C169-1, circuit CBP18 (GY/OG), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to U3.

  NO : VERIFY the SJB fuse 26 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

U3 CHECK THE REVERSING LAMP SWITCH

- Key in OFF position.



N0038837

Fig. 55: Checking Reversing Lamp Switch
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the reversing lamp switch C169-1, circuit CBP18 (GY/OG), harness side and the reversing lamp switch C169-2, circuit CBP12 (GN/WH), harness side.
- Key in ON position.
- **Do the reversing lamps illuminate?**

  YES : INSTALL a new reversing lamp switch. REFER to **Reversing Lamp Switch**. TEST the system for normal operation.

  NO : REPAIR circuit CBP12 (GN/WH) for an open. TEST the system for normal operation.

U4 CHECK FOR TCM DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: TCM Self-Test
- Carry out the TCM on-demand self-test.
- **Are any TCM DTCs present?**

  YES : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

  NO : VERIFY the SJB fuse 1 (10A) is OK. If OK, go to U5.

U5 CHECK CIRCUIT CBP12 (GN/WH) FOR AN OPEN

- Disconnect: Inoperative Reversing Lamp
- Disconnect: SJB C2280e
- Measure the resistance between an inoperative reversing lamp, harness side and the SJB, harness side as follows:

Vehicle	Inoperative Reversing Lamp Connector-Pin	SJB Connector-Pin	Circuit

Fusion	LH C488-1	C2280e-21	CBP12 (GN/WH)
Fusion	RH C487-1	C2280e-21	CBP12 (GN/WH)
Milan, MKZ	LH C451-1	C2280e-21	CBP12 (GN/WH)
Milan, MKZ	RH C461-1	C2280e-21	CBP12 (GN/WH)

- **Is the resistance less than 5 ohms?**

  YES : Go to U6.

  NO : REPAIR the circuit. CLEAR the DTC. REPEAT the self-test.

U6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test V: An Individual Reversing Lamp Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Reversing Lamps for schematic and connector information.

Normal Operation

When the transaxle is placed in REVERSE (R), voltage is supplied to the reversing lamps through circuit CBP12 (GN/WH). Ground to the reversing lamps is provided through circuit GD171 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

PINPOINT TEST V: AN INDIVIDUAL REVERSING LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

V1 CHECK CIRCUIT GD171 (BK/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Reversing Lamp
- Measure the resistance between the inoperative reversing lamp, harness side and ground as follows:

Vehicle	Inoperative Reversing Lamp Connector-Pin	Circuit
Fusion	LH C488-2	GD171 (BK/GY)
Fusion	RH C487-2	GD171 (BK/GY)
Milan, MKZ	LH C451-2	GD171 (BK/GY)
Milan, MKZ	RH C461-2	GD171 (BK/GY)

- **Is the resistance less than 5 ohms?**

  YES : REPAIR circuit CBP12 (GN/WH). TEST the system for normal operation.

  NO : REPAIR circuit GD171 (BK/GY). TEST the system for normal operation.

Pinpoint Test W: The Reversing Lamps Are On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Reversing Lamps for schematic and connector information.

Normal Operation - Automatic Transaxle

When the transaxle is placed in REVERSE (R), the transmission control module (TCM) sends gear status information (through the instrument cluster [IC] gateway) to the smart junction box (SJB). When the SJB receives a message indicating the transaxle is in REVERSE (R), the SJB provides ground to an internal relay, which routes the voltage to circuit CBP12 (GN/WH) to the reversing lamps and the electrochromatic rear view mirror (if equipped).

Manual Transaxle

Voltage is supplied to the reversing lamp switch through circuit CBP18 (GY/OG). When the transaxle is placed in REVERSE (R), the reversing lamp switch routes the voltage to circuit CBP12 (GN/WH) to the reversing lamps and the electrochromatic rear view mirror (if equipped).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Reversing lamp switch
- Rear view mirror
- SJB

PINPOINT TEST W: THE REVERSING LAMPS ARE ON CONTINUOUSLY

W1 CHECK THE TRANSAXLE TYPE

- Key in OFF position.
- Check the transaxle type on the vehicle.
- **Is the vehicle equipped with a manual transaxle?**

  YES : Go to W2.

  NO : Go to W3.

W2 CHECK THE REVERSING LAMP SWITCH

- Disconnect: Reversing Lamp Switch C169
- Key in ON position.
- **Do the reversing lamps continue to illuminate?**

  YES : For vehicles equipped with an auto-dimming mirror, go to W4.

  REPAIR circuit CPB12 (GN/WH) for a short to voltage. TEST the system for normal operation.

  NO : INSTALL a new reversing lamp switch. REFER to **Reversing Lamp Switch**. TEST the system for normal operation.

W3 CHECK FOR TCM DTCs

- Key in ON position.
- Carry out the TCM on-demand self-test.
- **Are any TCM DTCs present?**

  YES : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

  NO : For vehicles equipped with an auto-dimming mirror, go to W4.

  For vehicles not equipped with an auto-dimming mirror, go to W5.

W4 CHECK THE REAR VIEW MIRROR

- Key in OFF position.
- Disconnect: Rear View Mirror C911 or C9030
- Key in ON position.
- **Do the reversing lamps continue to illuminate?**

  YES : For vehicles with an automatic transaxle, go to W5.

For vehicles with a manual transaxle, REPAIR circuit CPB12 (GN/WH) for a short to voltage. TEST the system for normal operation.

NO : INSTALL a new rear view mirror. REFER to **REAR VIEW MIRRORS** article. TEST the system for normal operation.

W5 CHECK CIRCUIT CBP12 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280e
- Key in ON position.
- **Do the reversing lamps continue to illuminate?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to W6.

W6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

DAYTIME RUNNING LAMPS (DRL)

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

NOTE: The DRL is not a programmable parameter for this vehicle.

Fusion, Milan

The DRL feature operates the low beam headlamps at a reduced intensity when the ignition switch is in the RUN position, the headlamps are not on from any other input, and the transaxle is not in PARK (P) (automatic transaxle) or the parking brake is released (manual transaxle).

The SJB controls the DRL by using various inputs to determine whether or not the DRL should be illuminated. These inputs include:

- Ignition switch position
- Headlamp switch position
- Headlamps on or off
- Parking brake status (manual transaxle)
- Transaxle gear selection (automatic transaxle)

MKZ

The DRL feature operates the front turn lamps (on solidly, not flashing) when the ignition switch is in the RUN position, the headlamps are not on from any other input, and the transaxle is not in PARK (P).

The SJB controls the DRL by using various inputs to determine whether or not the DRL should be illuminated. These inputs include:

- Ignition switch position
- Headlamp switch position
- Headlamps on or off
- Transaxle gear selection

Inspection and Verification

1. Verify the customer concern.
2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

   NOTE: Make sure the headlamp switch is in the OFF position.

   NOTE: Make sure the multifunction switch is not in the HIGH BEAM position.

   NOTE: Make sure to use the latest scan tool software release.

3. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

4. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
5. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
6. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
7. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The daytime running lamps (DRL) are inoperative	• Exterior lighting system input/output • Ignition switch input • Parking brake switch input (manual transaxle) • Transaxle gear input (automatic transaxle) • Smart junction box (SJB)	• Go to **Pinpoint Test X**.

Pinpoint Tests

Pinpoint Test X: The Daytime Running Lamps (DRL) Are Inoperative

Normal Operation - Fusion, Milan

When the ignition switch is in the RUN position, the headlamps are not on (from the autolamp system or manual control from the headlamp switch) and the transmission is not in PARK (P) (automatic transaxle) or the parking brake is released (manual transaxle), the smart junction box (SJB) provides a pulse-width modulated (PWM) voltage to the low beam headlamps. This illuminates the headlamps at a reduced intensity.

MKZ

When the ignition switch is in the RUN position, the headlamps are not on (from the autolamp system or manual control from the headlamp switch) and the transmission is not in PARK (P), the SJB provides voltage to the front turn lamps (on solidly, not flashing).

This pinpoint test is intended to diagnose the following:

- Exterior lighting system input/output
- Ignition switch input
- Parking brake switch input (manual transaxle)
- Transmission gear input (automatic transaxle)
- SJB

PINPOINT TEST X: THE DAYTIME RUNNING LAMPS (DRL) ARE INOPERATIVE

X1 VERIFY THE DRL OPERATION

- Key in ON position.
- Place the headlamp switch in the OFF position.
- For vehicles with a manual transaxle, release the parking brake.
- For vehicles with an automatic transaxle, place the gear selector lever in any gear other than PARK (P).
- **Are the DRL illuminated?**

  YES : The system is operating correctly. INFORM the customer of the conditions required for the DRL to operate correctly.

  NO : Go to X2.

X2 CHECK THE OPERATION OF THE HEADLAMPS OR FRONT TURN LAMPS

- For Fusion or Milan, place the headlamp switch in the HEADLAMPS ON position and observe the headlamps.
- For MKZ, turn the hazard flasher lamps on and observe the front turn lamps.
- **Do the headlamps or front turn lamps operate correctly?**

  YES : Go to X3.

  NO : REFER to **Headlamps** or **Turn Signal and Hazard Lamps**.

X3 CHECK THE IGNITION SWITCH INPUT

- Place the headlamp switch in the OFF position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB ignition switch (IGN_SW) PID while cycling the ignition switch through all its positions.
- **Does the PID agree with the ignition switch positions?**

  YES : For vehicles with an automatic transaxle, go to X4.

  For vehicles with a manual transaxle, go to X5.

NO : REFER to **STEERING COLUMN SWITCHES** article to diagnose the input from the ignition switch.

X4 CHECK THE TRANSAXLE GEAR INPUT

- Enter the following diagnostic mode on the diagnostic tool: Transmission Control Module (TCM) DataLogger
- Monitor the TCM transmission range (TR) PID while placing the gear selector lever through all its positions.
- **Does the PID agree with the gear selection?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article to diagnose the transmission range input.

X5 CHECK THE BRAKE WARNING INDICATOR OPERATION

- Apply and release the parking brake while observing the brake warning indicator.
- **Does the brake warning indicator operate correctly?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the parking brake switch input.

GENERAL PROCEDURES

HEADLAMP ADJUSTMENT

Special Tools

Illustration	Tool Name	Tool Number
 ST3041-A	Vision 100 Headlamp Aimer	196-00005 or equivalent

Headlamp Aiming

1. The headlamp aiming procedure depends on what type of beam pattern the headlamp is equipped with. Vehicles may come equipped with VOL or VOR headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
   - VOL and SAE
   - VOR and SAE
2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.

- Photometric aimers can aim VOL- and VOR- headlamps. This is the preferred method of headlamp aiming.
- Visual or screen method aiming can be used to aim VOL- and VOR- headlamps.
- Mechanical aimers cannot be used with VOR- or VOL-type headlamps. Aerodynamic lamps that can be aimed mechanically have 3 nibs molded into the lens of the lamp.

Photometric Aiming

1. For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction article.

Screen Method Aiming

All headlamp types

NOTE: Horizontal aim is not necessary for VOL or VOR headlamps.

NOTE: Consult your state vehicle inspection article for recommended tolerance ranges for visual aiming.

NOTE: The sight shield may need to be positioned or removed for access to the adjusters.

1. Before starting headlamp adjustment:
   - check the tire inflation.
   - check that no other load is in the vehicle other than a half tank of fuel.
   - check that the headlamps are clean.
   - check for correct headlamp operation.
   - check that the vehicle is on level ground.
   - if the vehicle is equipped with air suspension, make sure that the switch is on.

   NOTE: The vertical wall or screen must be a minimum of 2.4-m (8-ft) wide.

2. Park the vehicle on a level surface approximately 7.6-m (25-ft) from the vertical wall or screen directly in front of it.

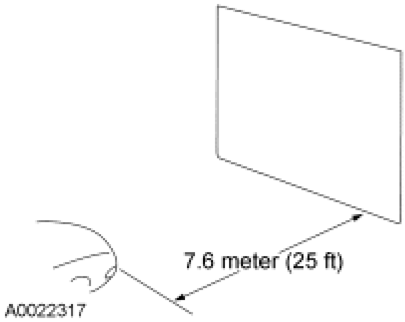


Fig. 56: Identifying Distance Between Vehicle And Vertical Wall Or Screen
Courtesy of FORD MOTOR CO.

NOTE: **The center of the lamp is marked either on the lens (circle, cross-hair or other mark) or on the bulb shield internal to the lamp (cross-hair or other mark).**

3. Mark a horizontal reference line on the vertical wall or screen.
    1. Measure the center of the headlamp height to ground and record the measurement.
    2. Make a 2.4-meter (8-ft) horizontal mark (using masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.

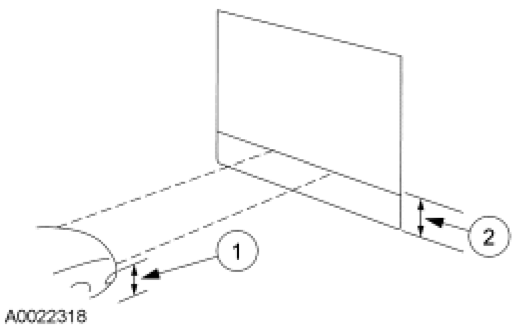

Fig. 57: Aiming Headlights
Courtesy of FORD MOTOR CO.

NOTE: **This procedure should be done in a dark environment to effectively see the headlamp beam pattern.**

4. Turn on the low beam headlamps to illuminate the wall or screen and open the hood.
5. On the wall or screen, locate the high intensity area of the beam pattern.

VOR-type headlamps

NOTE: **The appearance of the VOR beam pattern may vary between vehicles.**

6. Identify at the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern. If the

top edge of this cutoff is not even with the horizontal reference line, the headlamp beam needs to be adjusted using the headlamp adjusting screw.

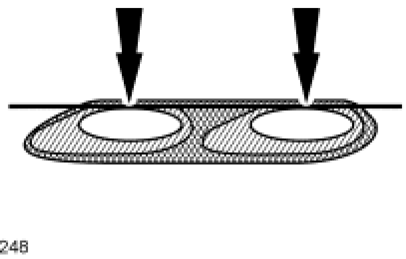

Fig. 58: Identifying High Intensity Area (VOR Type Headlamps)
Courtesy of FORD MOTOR CO.

VOL-type headlamps

7. For VOL-type headlamps, there is a distinct cutoff in the left portion of the beam pattern. The edge of this cutoff should be positioned 50.2 mm (2 in) below the horizontal reference line. Adjust the headlamp as necessary using the headlamp adjusting screw.
    1. Horizontal reference line.
    2. Top edge of the beam pattern.
    3. High intensity zone.

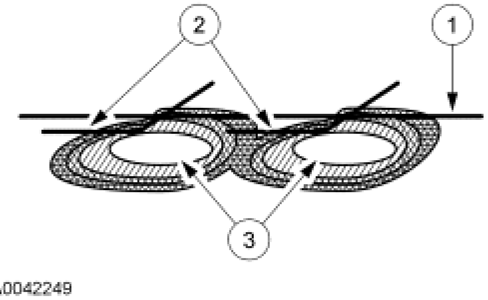

Fig. 59: Identifying VOL-Type Headlamps Beam Pattern
Courtesy of FORD MOTOR CO.

FRONT FOG LAMP ADJUSTMENT

NOTE:	**The adjuster screw can be accessed through an opening in the lower air deflector.**

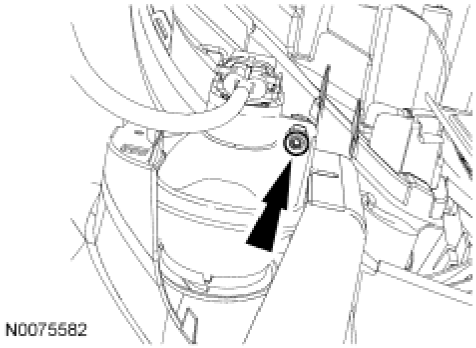

Fig. 60: Fog Lamp Adjustment Screw Location
Courtesy of FORD MOTOR CO.

NOTE: **Horizontal aim is not required for this vehicle and is not adjustable. Consult your state vehicle inspection center for recommended tolerance ranges for visual aiming.**

1. Before starting the fog lamp assembly adjustment:
   - check the tire inflation.
   - make sure there are no other loads in the vehicle other than a half tank of fuel.
   - make sure the vehicle is on level ground.
   - make sure the fog lamps and headlamps are clean.
   - make sure the headlamps are operating and are correctly aimed.

NOTE: **The vertical wall screen must be a minimum of 2.4-m (8-ft) wide.**

2. Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.

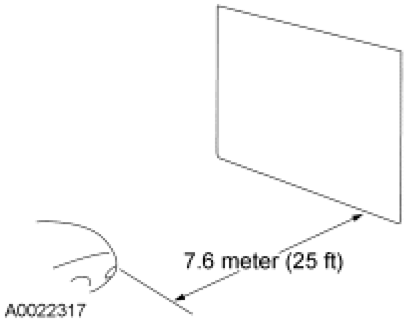

Fig. 61: Identifying Distance Between Vehicle And Vertical Wall Or Screen
Courtesy of FORD MOTOR CO.

3. The correct visual aim for the fog lamps is with the top edge of the high-intensity zone 10 cm (4 in) below the horizontal center of the fog lamps.

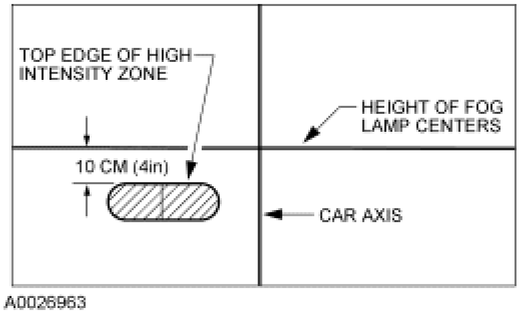

Fig. 62: Identifying Correct Visual Aim For Fog Lamps
Courtesy of FORD MOTOR CO.

4. If necessary, rotate the adjusting screw until the fog lamp beam is within specification.

AUTOLAMPS TIME DELAY ADJUSTMENT

NOTE: Steps 2 through 5 must be carried out within a 10-second period.

1. Start with the ignition switch off and the headlamp switch in the AUTOLAMPS ON position.
2. Place the headlamp switch in the OFF position.
3. Place the ignition switch in the RUN position.
4. Place the ignition switch in the OFF position.
5. Place the headlamp switch in the AUTOLAMPS ON position. The exterior lamps turn on at this point.
6. Wait the desired amount of time and place the headlamp switch in the OFF position (maximum of 3 minutes). The exterior lamps turn off and the autolamp time delay is now set.

REMOVAL AND INSTALLATION

HEADLAMP ASSEMBLY

NOTE: Fusion shown, Milan and MKZ similar.

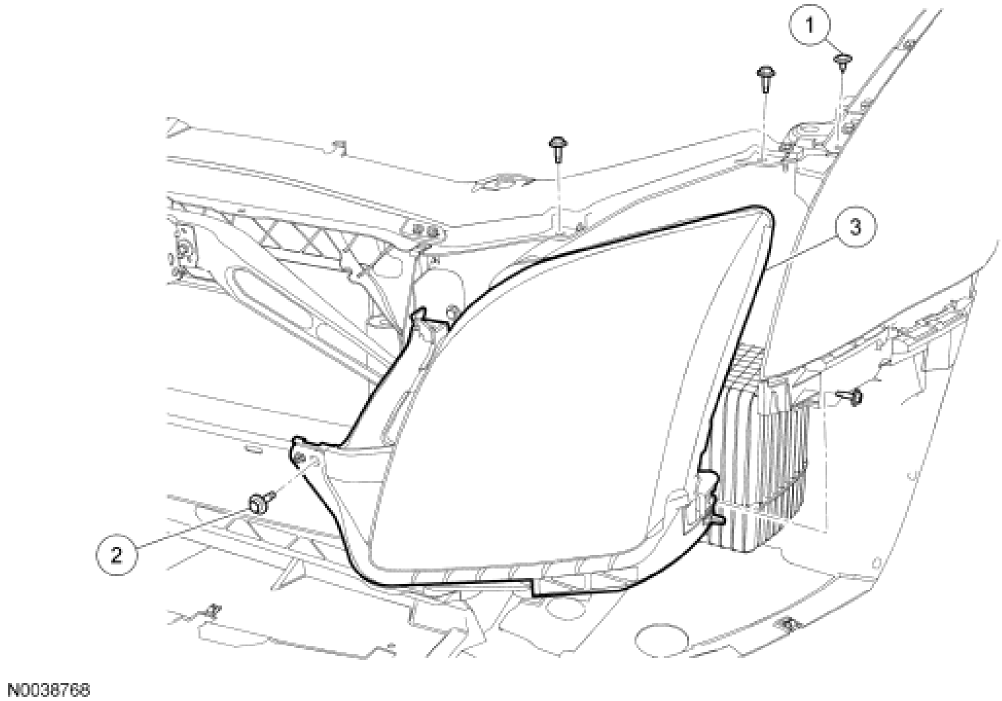

Fig. 63: Exploded View Of Headlamp Assembly
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Headlamp assembly pin-type retainer (part of 13005)
2	W711676	Headlamp assembly bolts (4 required)
3	13005/13006	Headlamp assembly (LH/RH)

REMOVAL AND INSTALLATION

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

1. Remove the front bumper cover. For additional information, refer to **BUMPERS** article.
2. Remove the headlamp assembly pin-type retainer.
3. Remove the 4 bolts and the headlamp assembly.
   - Disconnect the electrical connectors.
4. To install, reverse the removal procedure.

HEADLAMP BULB - LH

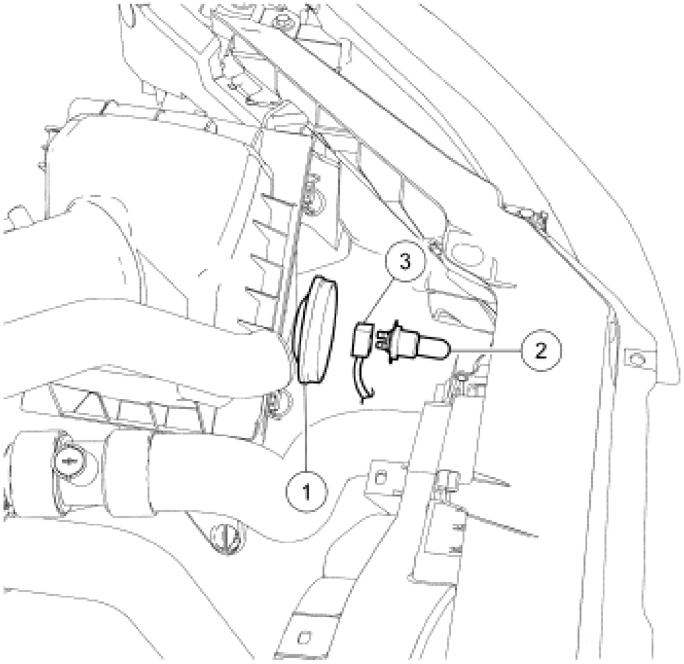

Fig. 64: Exploded View Of Headlamp Bulb - LH (High Beam)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp high beam bulb
3	-	Headlamp high beam bulb electrical connector (part of 13005)

NOTE: **Standard headlamp bulb shown, high intensity discharge (HID) bulb similar.**

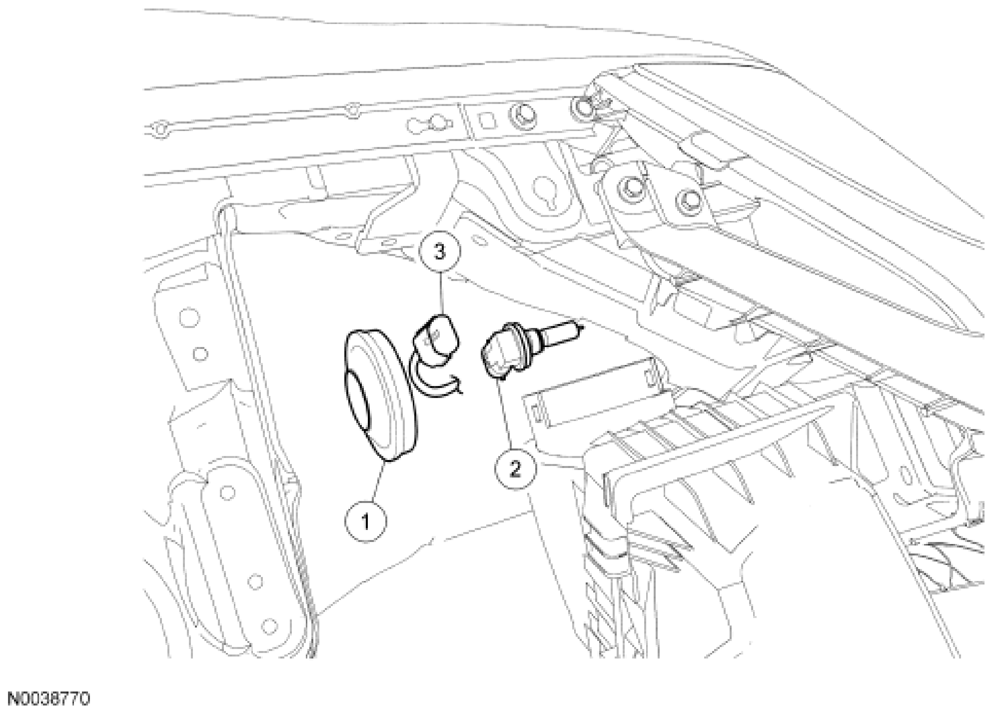

Fig. 65: Exploded View Of Headlamp Bulb - LH (Low Beam)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp low beam bulb
3	-	Headlamp low beam bulb electrical connector (part of 13005)

REMOVAL AND INSTALLATION

WARNING: **The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.**

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed from the headlamp.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Low beam bulb (vehicles equipped with a 2.3L or 3.0L engine)

1. Remove the air cleaner intake pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.

   Low beam or high beam bulb

2. Remove the headlamp bulb protective cover.
3. Remove the headlamp bulb.
   - Disconnect the electrical connector.
4. To install, reverse the removal procedure.
   - Make sure the headlamp bulb protective cover is completely sealed.

HEADLAMP BULB - RH

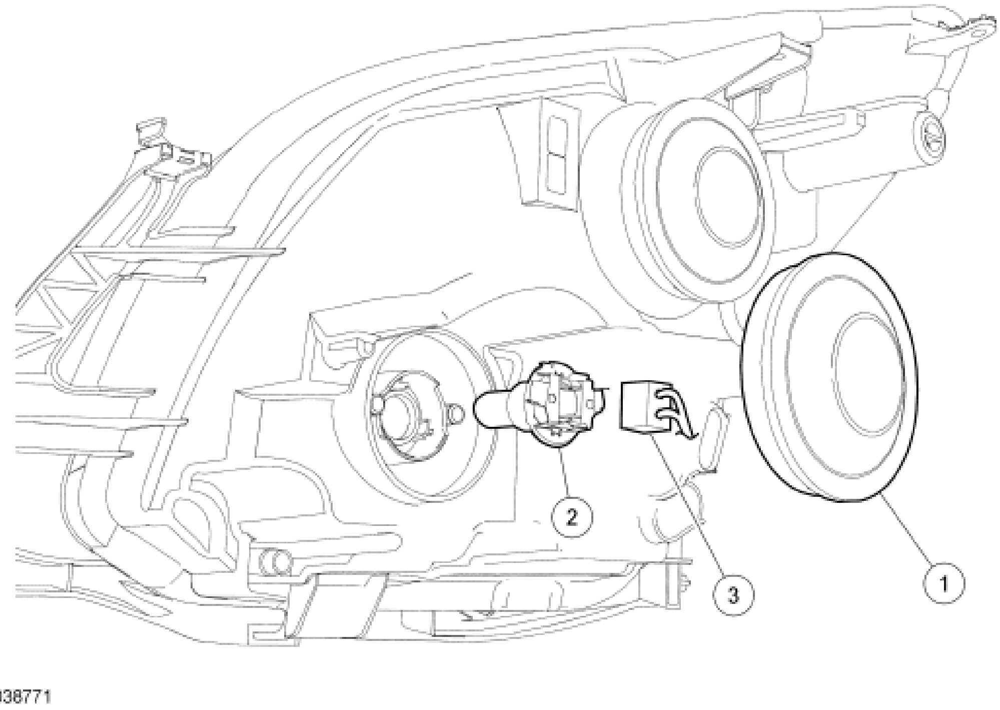

Fig. 66: Exploded View Of Headlamp Bulb - RH (High Beam)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp high beam bulb
3	-	Headlamp high beam bulb electrical connector (part of 13006)

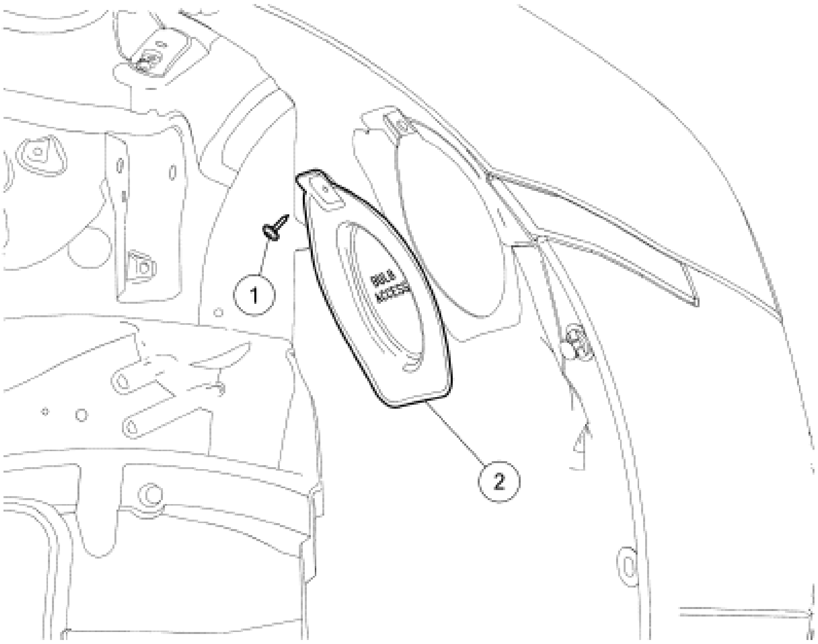

Fig. 67: Exploded View Of Headlamp Bulb - RH (Low Beam)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706805	Fender splash shield access cover screw
2	16F029	Fender splash shield access cover

NOTE: Standard headlamp bulb shown, high intensity discharge (HID) bulb similar.

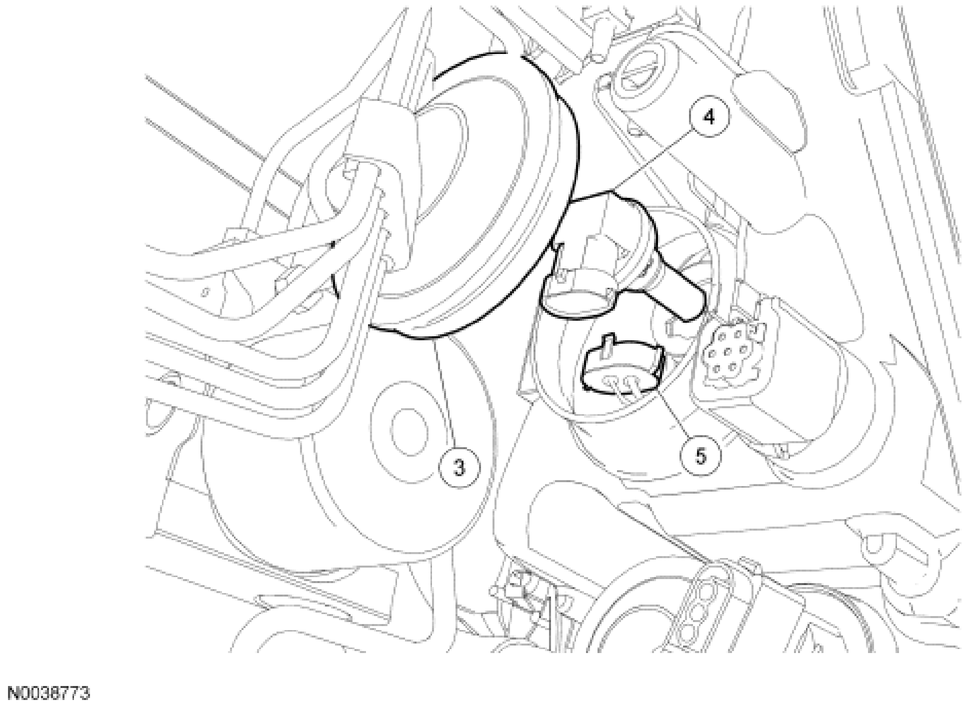

Fig. 68: Exploded View Of Standard Headlamp Bulb
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
3	13N019	Headlamp bulb protective cover
4	13N021	Headlamp low beam bulb
5	-	Headlamp low beam bulb electrical connector (part of 13006)

REMOVAL AND INSTALLATION

WARNING: **The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.**

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed from the headlamp.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Low beam bulb

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the screw and the fender splash shield access cover.

High beam bulb, vehicles with ABS

NOTE: For vehicles with a 3.5L engine, remove the engine appearance cover.

3. Remove the bolt and the windshield washer reservoir filler tube.

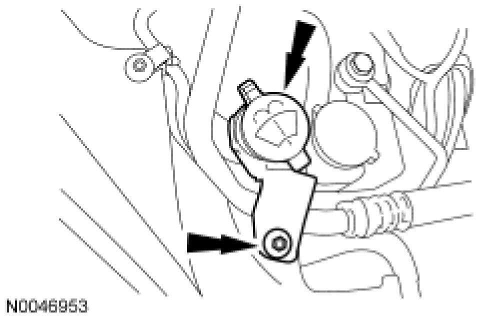

Fig. 69: Locating Bolt And Windshield Washer Reservoir Filler Tube
Courtesy of FORD MOTOR CO.

High beam bulb, vehicles without ABS

4. Disconnect the windshield washer reservoir filler tube.

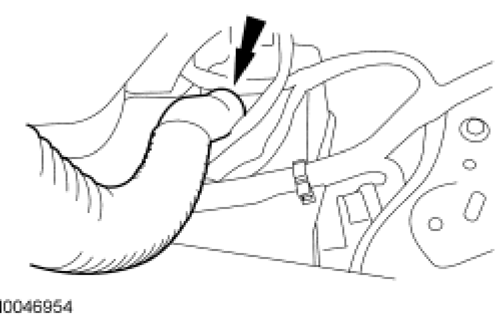

Fig. 70: Locating Windshield Washer Reservoir Filler Tube
Courtesy of FORD MOTOR CO.

Low beam or high beam bulb

5. Remove the headlamp bulb protective cover.
6. Remove the headlamp bulb.
   - Disconnect the electrical connector.
7. To install, reverse the removal procedure.

- Make sure the headlamp bulb protective cover is completely sealed.

BALLAST

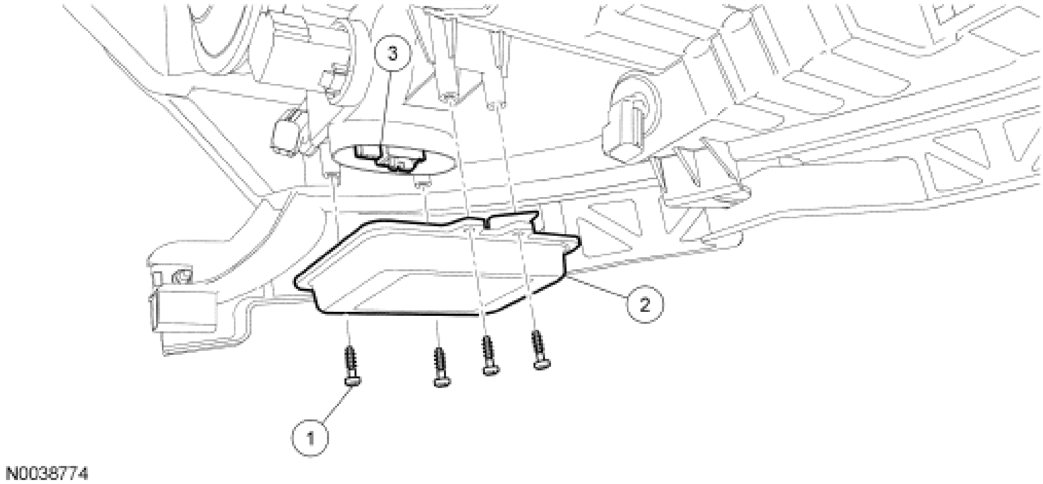

Fig. 71: Exploded View Of Ballast
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ballast screws (4 required) (part of 13005)
2	13C170	Ballast
3	-	Ballast electrical connectors (part of 13005)

REMOVAL AND INSTALLATION

1. Remove the headlamp assembly. For additional information, refer to **Headlamp Assembly**.
2. Remove the 4 screws and the ballast.
   - Disconnect the electrical connectors.
3. To install, reverse the removal procedure.

FOG LAMP

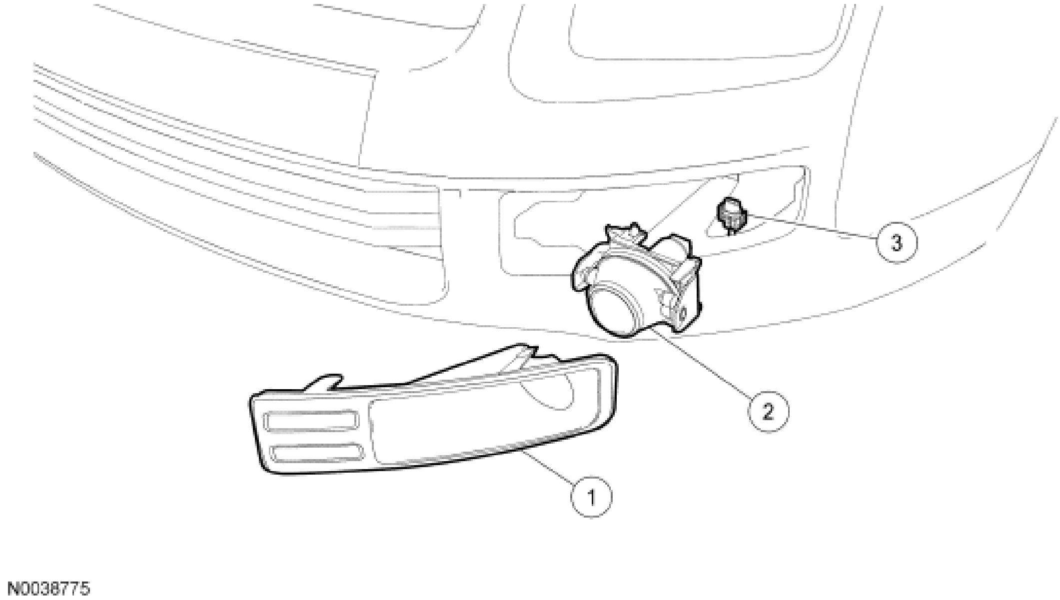

Fig. 72: Exploded View Of Fog Lamp
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	17K946	Fog lamp bezel
2	15K200	Fog lamp
3	-	Fog lamp electrical connector (part of 14290)

REMOVAL AND INSTALLATION

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the 4 screws and position the fender splash shield aside.
3. Release the tabs and remove the fog lamp bezel.
4. Release the locking tabs and remove the fog lamp.
   - Disconnect the electrical connector.
5. To install, reverse the removal procedure.

FOG LAMP BULB

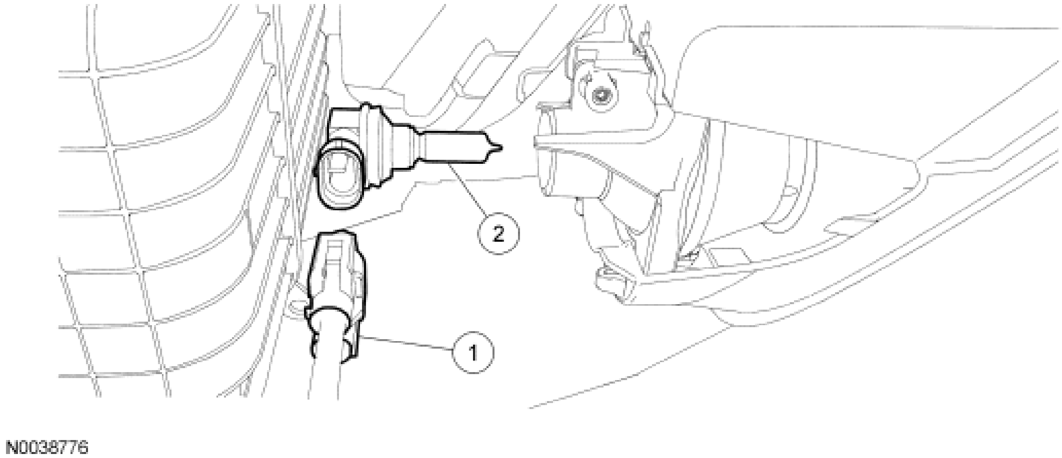

Fig. 73: Exploded View Of Fog Lamp Bulb
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Fog lamp electrical connector (part of 14290)
2	13N021	Fog lamp bulb

REMOVAL AND INSTALLATION

WARNING: **The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.**

NOTE: The fog lamp bulb should not be removed from the fog lamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect fog lamp bulb performance. Contaminants may enter the fog lamp where they can settle on the lens and reflector. Never turn on the fog lamps with the bulb removed.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the electrical connector and remove the fog lamp bulb.
3. To install, reverse the removal procedure.

PARKING LAMP BULB - FRONT

NOTE: LH shown, RH similar.

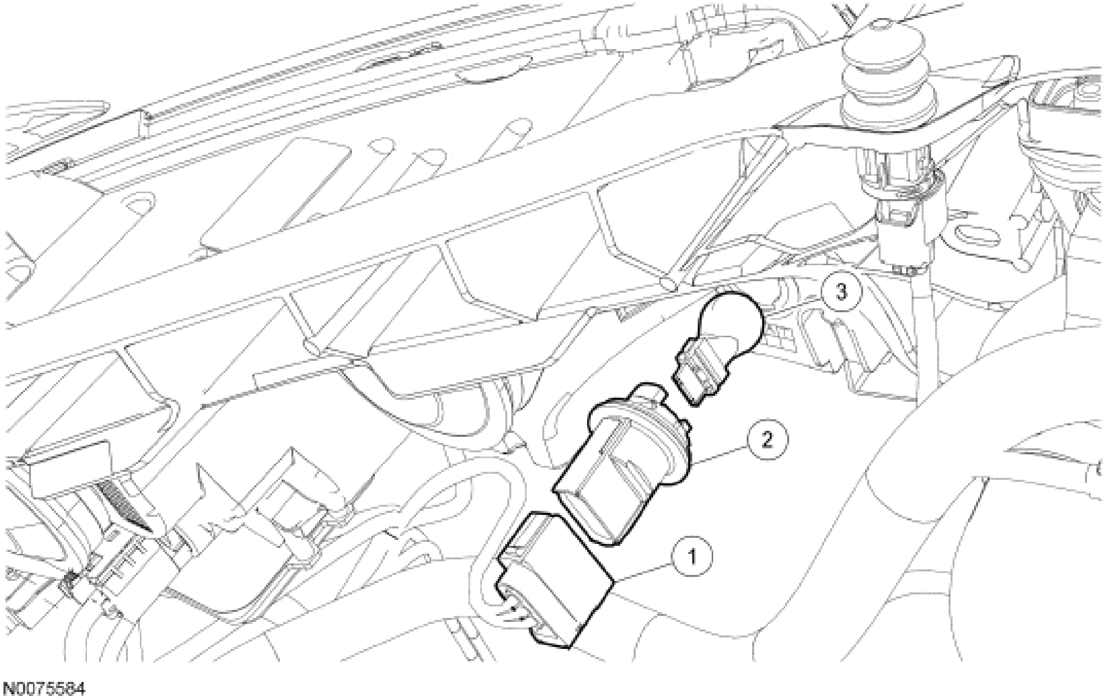

Fig. 74: Exploded View Of Front Parking Lamp Bulb - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Front parking lamp electrical connector (part of 14290)
2	13411	Front parking lamp bulb socket
3	13466	Front parking lamp bulb

NOTE: **LH shown, RH similar.**

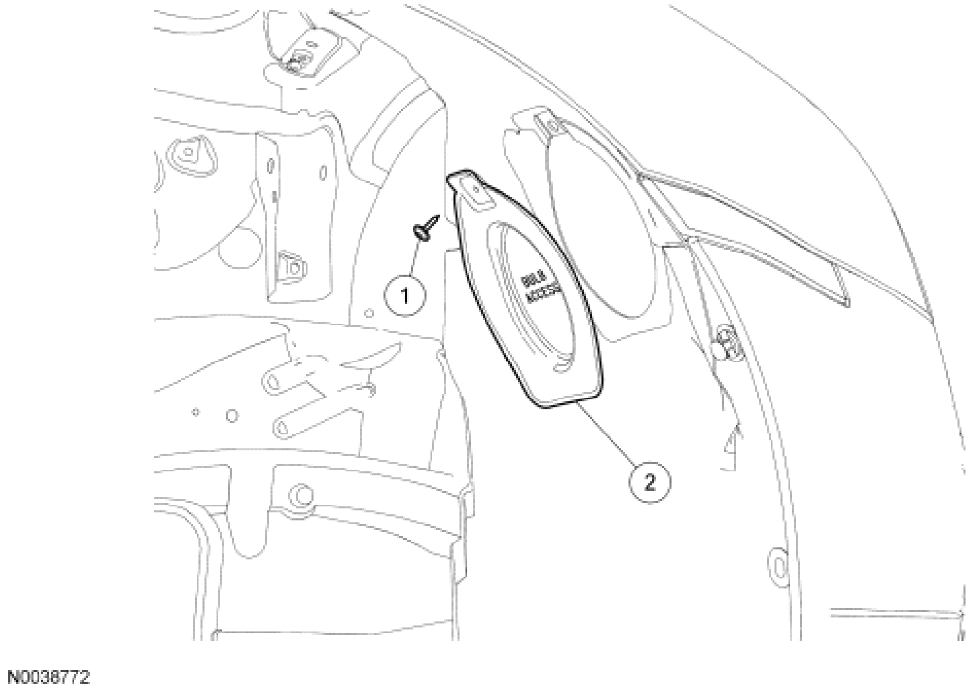

Fig. 75: Exploded View Of Front Parking Lamp Bulb - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706805	Fender splash shield access cover screw
2	16F029	Fender splash shield access cover

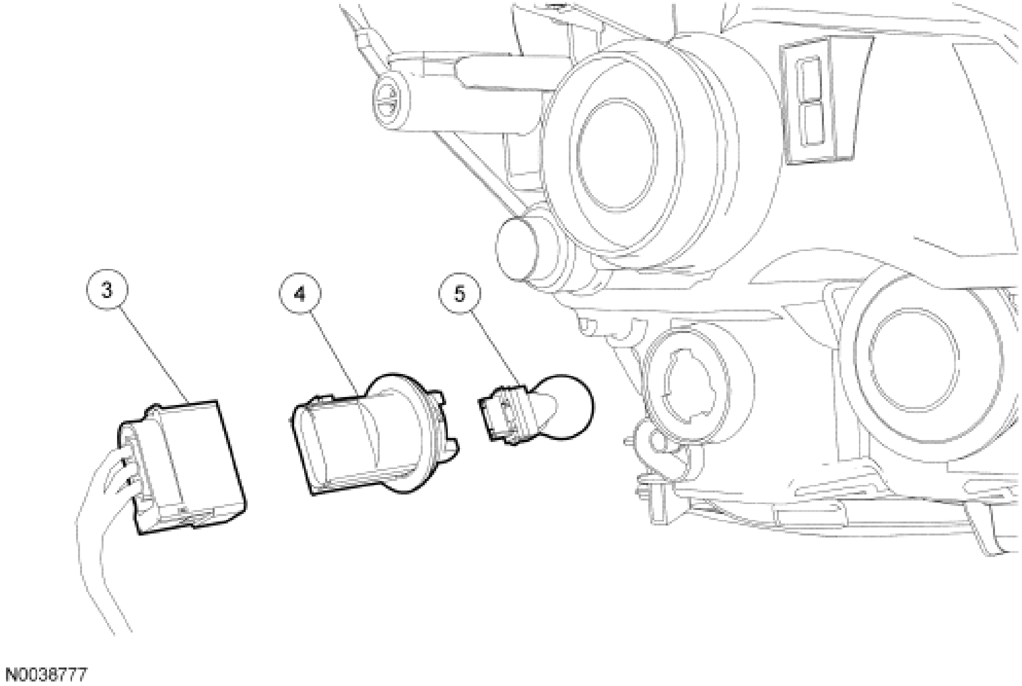

Fig. 76: Exploded View Of Front Parking Lamp Bulb Electrical Connector
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
3	-	Front parking lamp electrical connector (part of 14290)
4	13411	Front parking lamp bulb socket
5	13466	Front parking lamp bulb

REMOVAL AND INSTALLATION

MKZ LH front parking lamp bulb

1. Remove the air cleaner. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.

   MKZ LH or RH front parking lamp bulb

2. Remove the front parking lamp socket from the headlamp assembly.
   - Remove the front parking lamp bulb.

   Fusion, Milan RH front parking lamp bulb

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

4. Remove the screw and the fender splash shield access cover.

Fusion, Milan LH or RH front parking lamp bulb

5. Remove the front parking lamp socket from the headlamp assembly.
   - Remove the front parking lamp bulb.

All vehicles

6. To install, reverse the removal procedure.

SIDE MARKER LAMP

NOTE: LH shown, RH similar.

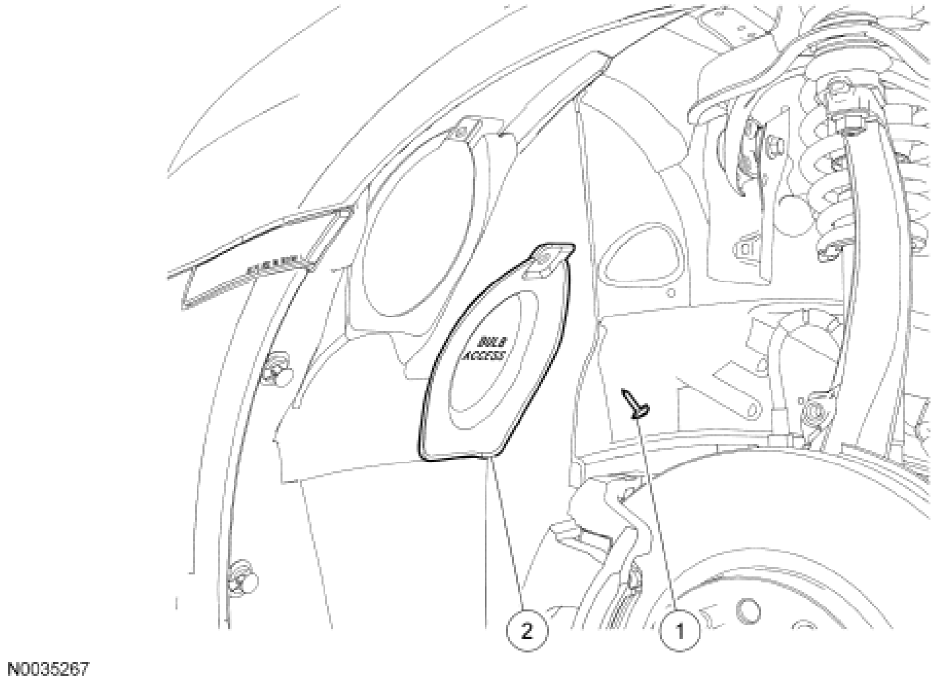

Fig. 77: Exploded View Of Side Marker Lamp - All vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706805	Fender splash shield access cover screw
2	16F029	Fender splash shield access cover

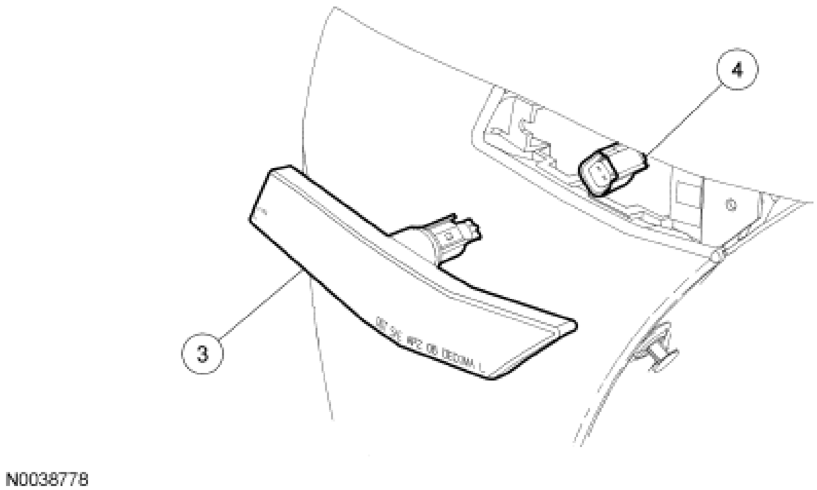

Fig. 78: Exploded View Of Side Marker Lamp - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
3	13200	Side marker lamp
4	-	Side marker lamp electrical connector (part of 14290)

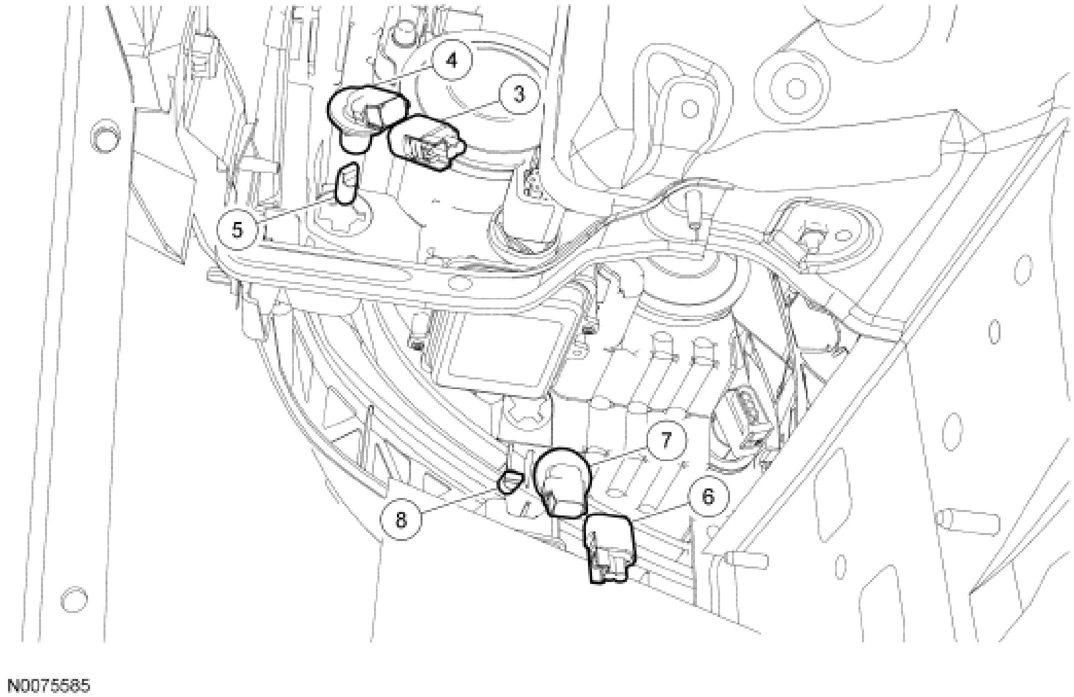

Fig. 79: Exploded View Of Side Marker Lamp - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
3	-	Side marker lamp electrical connector (part of 14290)
4	13411	Side marker lamp bulb socket
5	13466	Side marker lamp bulb
6	-	Front marker lamp electrical connector (part of 14290)
7	13411	Front marker lamp bulb socket
8	13466	Front marker lamp bulb

REMOVAL AND INSTALLATION

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the screw and the fender splash shield access cover.

Fusion, Milan

3. Release the tabs and remove the side marker lamp.
   - Disconnect the electrical connector.

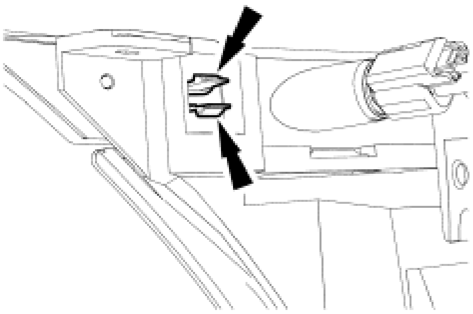

Fig. 80: Identifying Side Marker Lamp Electrical Connector
Courtesy of FORD MOTOR CO.

MKZ

NOTE: Rotate the bulb holder approximately one-eighth turn counterclockwise to remove.

4. Disconnect the electrical connector and remove the marker lamp from the headlamp assembly.

All vehicles

5. To install, reverse the removal procedure.

LIGHT SENSOR

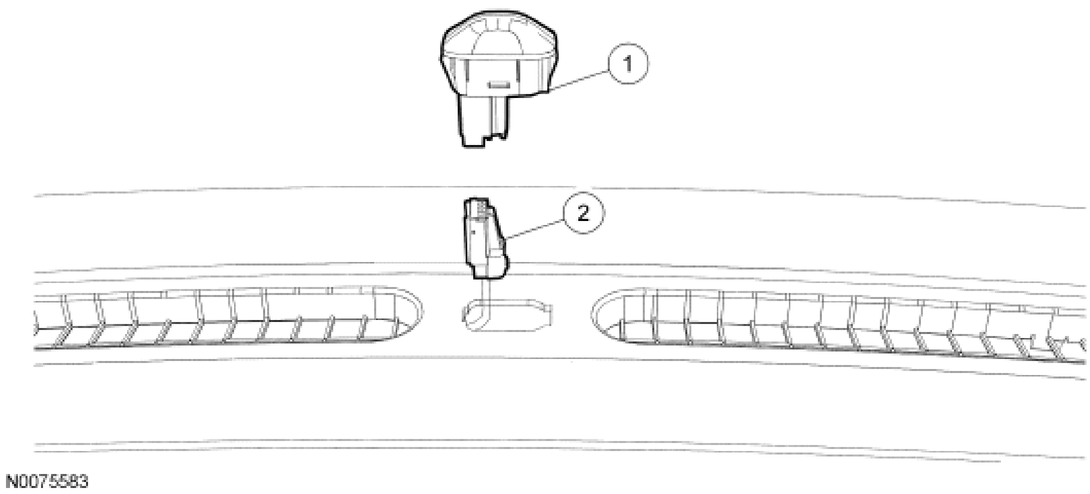

Fig. 81: Exploded View Of Light Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13A018	Light sensor
2	-	Light sensor electrical connector (part of 14401)

REMOVAL AND INSTALLATION

1. Using a suitable tool, remove the light sensor from the defroster grille.
    - Disconnect the electrical connector.
2. To install, reverse the removal procedure.

STOPLAMP SWITCH

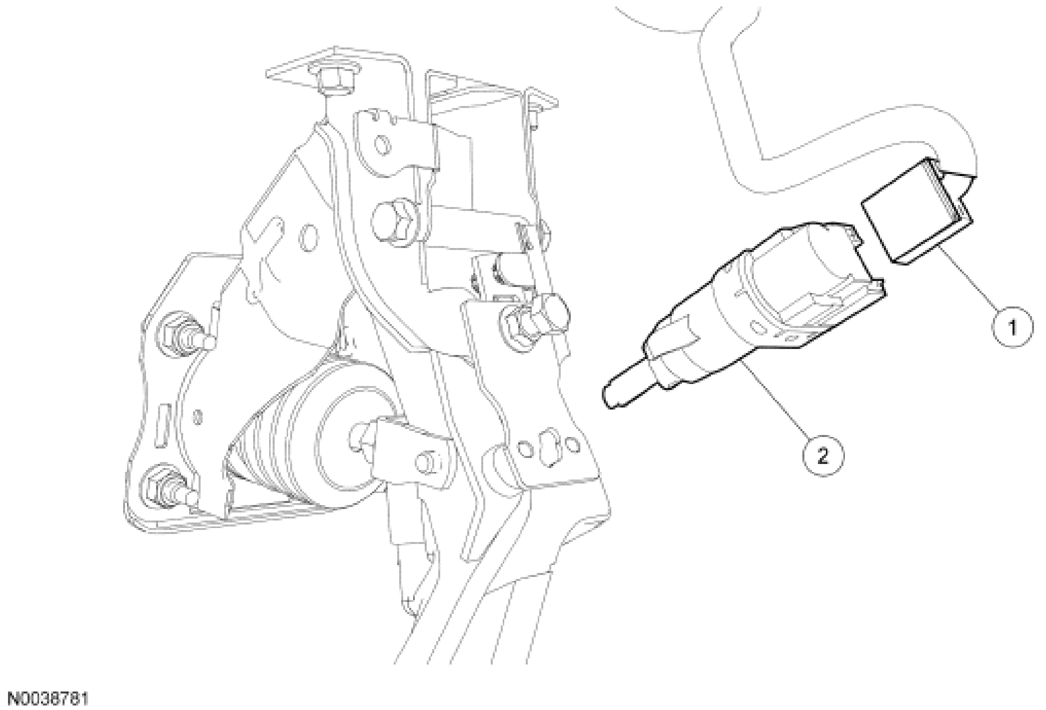

Fig. 82: Exploded View Of Stoplamp Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Stoplamp switch electrical connector (part of 14290)
2	13480	Stoplamp switch

REMOVAL AND INSTALLATION

CAUTION: Do not press, pull or otherwise move the brake pedal while removing or installing the stoplamp switch. The switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing the switch with the brake pedal in any other position results in incorrect adjustment and damage to the switch.

CAUTION: The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch with the plunger extended (during brake pedal apply) results in damage to the switch.

NOTE: Rotate the stoplamp switch clockwise approximately 1/8 turn to remove.

1. Rotate the stoplamp switch clockwise 45 degrees and remove the stoplamp switch.
   - Disconnect the electrical connector.
2. To install, reverse the removal procedure.

HEADLAMP SWITCH

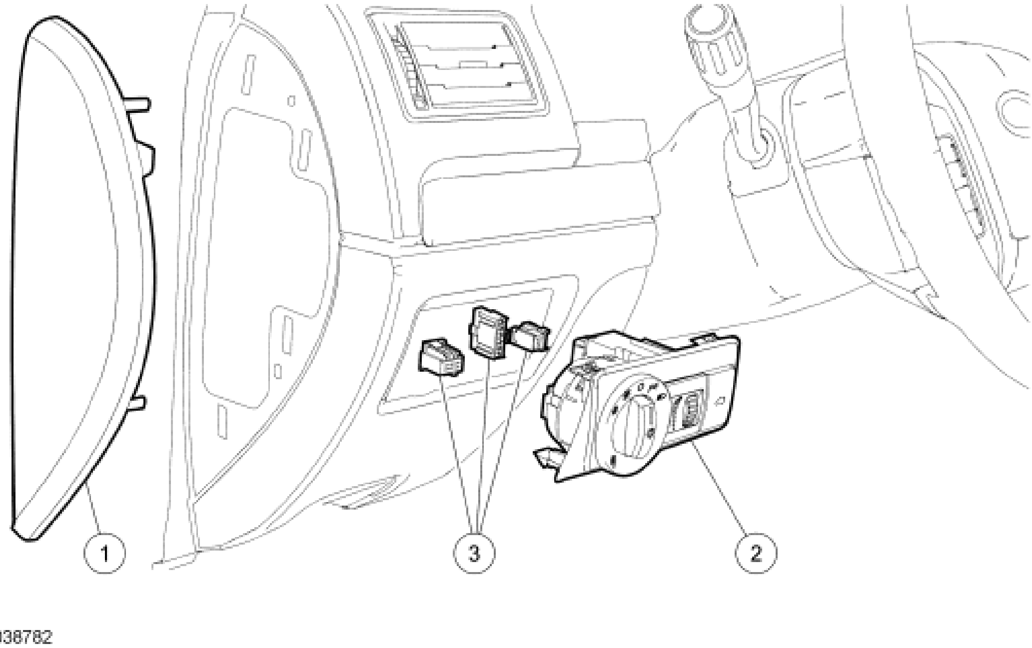

Fig. 83: Exploded View Of Headlamp Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5404481	Instrument panel side finish panel
2	11654	Headlamp switch
3	-	Headlamp switch electrical connectors (part of 14401)

REMOVAL AND INSTALLATION

1. Remove the instrument panel side finish panel.

NOTE: The headlamp switch is removed by pushing from behind.

2. Release the tabs and remove the headlamp switch.
   - Disconnect the electrical connectors.
3. To install, reverse the removal procedure.

HAZARD FLASHER LAMP SWITCH

NOTE: MKZ shown, Fusion and Milan similar.

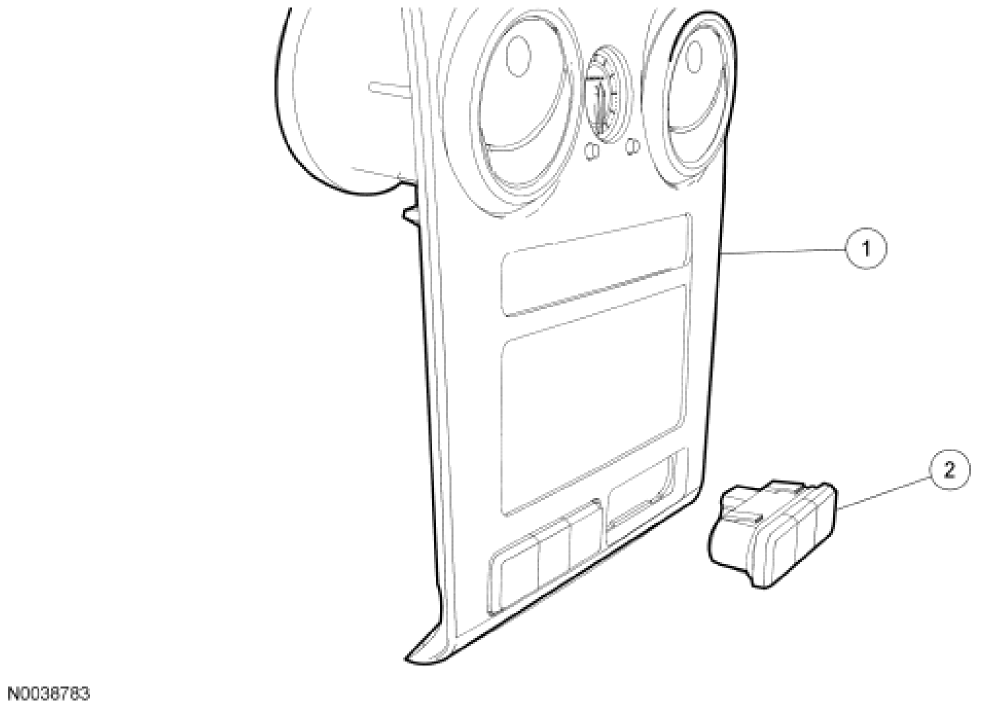

Fig. 84: Exploded View Of Hazard Flasher Lamp Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5404302	Instrument panel center finish panel
2	13D734	Hazard flasher lamp switch

REMOVAL AND INSTALLATION

1. Remove the instrument panel center finish panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Release the tabs and remove the hazard flasher lamp switch.
3. To install, reverse the removal procedure.

PUDDLE LAMP

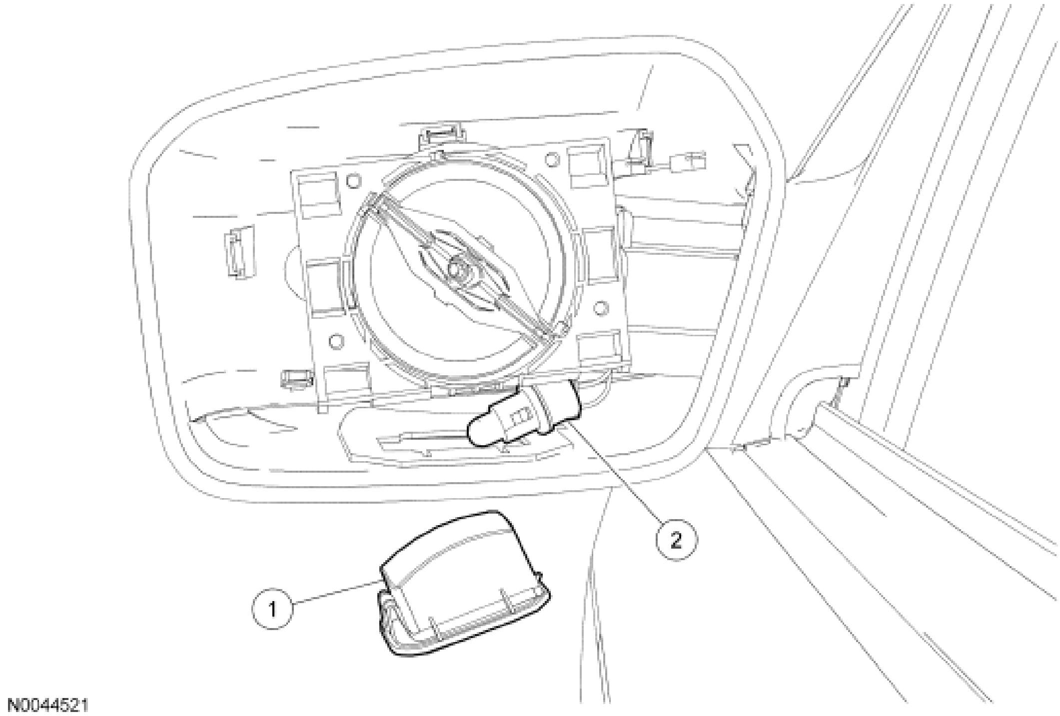

Fig. 85: Exploded View Of Puddle Lamp
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13B375	Puddle lamp
2	-	Puddle lamp bulb socket (part of 17683)

REMOVAL AND INSTALLATION

1. Remove the exterior mirror glass. For additional information, refer to **REAR VIEW MIRRORS** article.
2. Release the tab to remove the puddle lamp from the mirror housing.

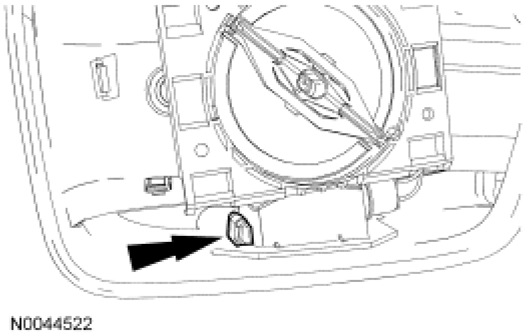

Fig. 86: Locating Puddle Lamp
Courtesy of FORD MOTOR CO.

NOTE: **The LH puddle lamp bulb socket is rotated clockwise to remove and the**

RH puddle lamp bulb socket is rotated counterclockwise to remove.

3. Rotate the puddle lamp bulb socket approximately 1/4 turn and remove it from the puddle lamp.

NOTE: **When rotating the bulb socket in the puddle lamp, the socket should come to a stop indicating it is completely installed.**

NOTE: **An audible click can be heard when the puddle lamp is fully seated.**

4. To install, reverse the removal procedure.

REVERSING LAMP SWITCH

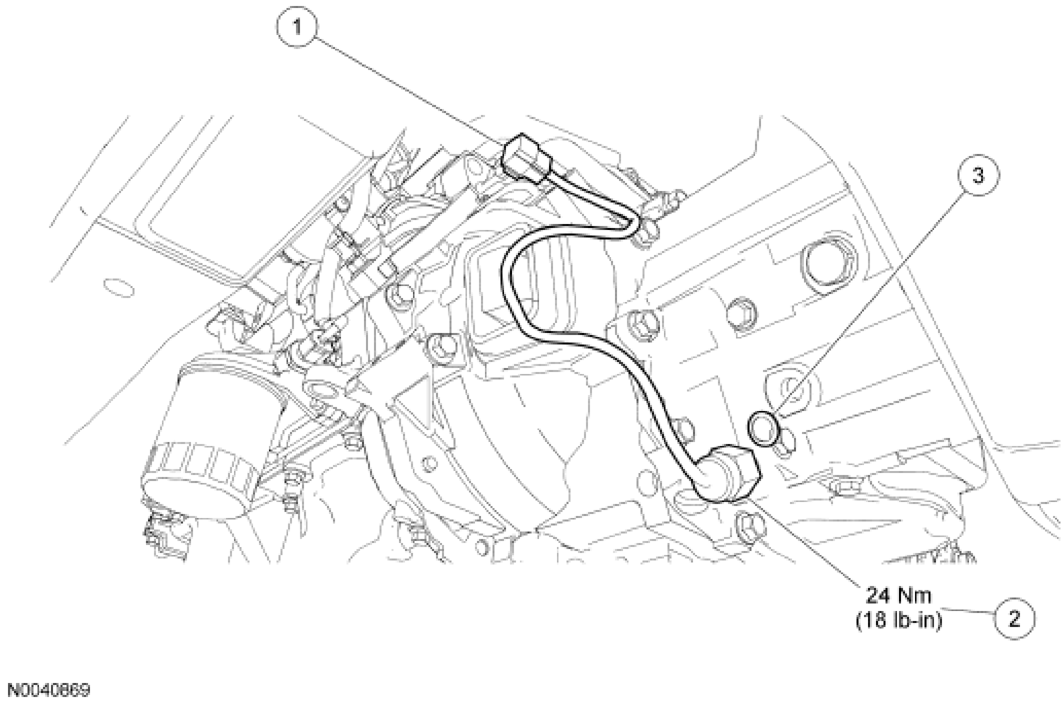

Fig. 87: Exploded View Of Reversing Lamp Switch With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Reversing lamp switch electrical connector (part of 7B229)
2	7B229	Reversing lamp switch
3	S995621	Reversing lamp switch gasket

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING**

AND LIFTING article.

2. Remove the fasteners and the lower engine splash shield.

NOTE: Discard the reversing lamp switch gasket.

3. Disconnect the electrical connector and remove the reversing lamp switch.
    - To install, tighten to 24 Nm (18 lb-ft).
4. To install, reverse the removal procedure.
    - Install a new reversing lamp switch gasket.
    - Check the transmission fluid and fill as necessary. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION** article.

HIGH MOUNTED STOPLAMP

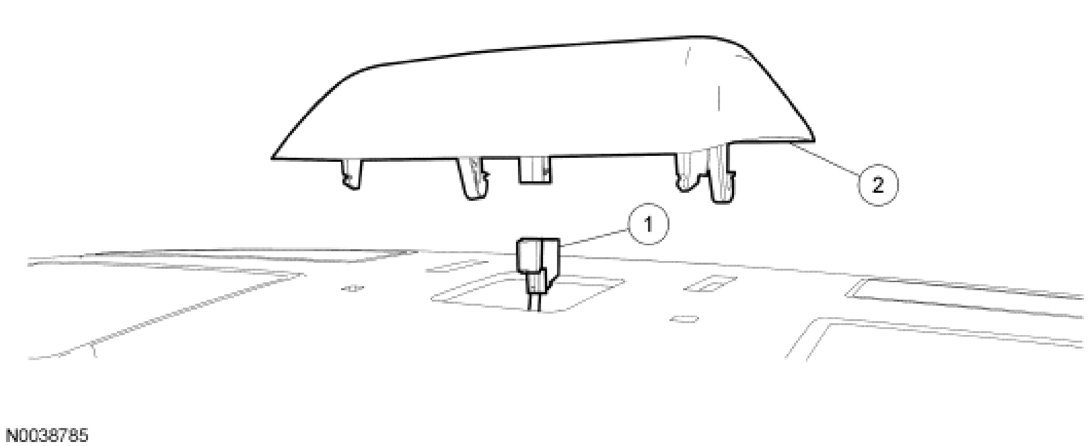

Fig. 88: Parcel Shelf Mounted
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	High mounted stoplamp electrical connector (part of 14A005)
2	13A613	High mounted stoplamp

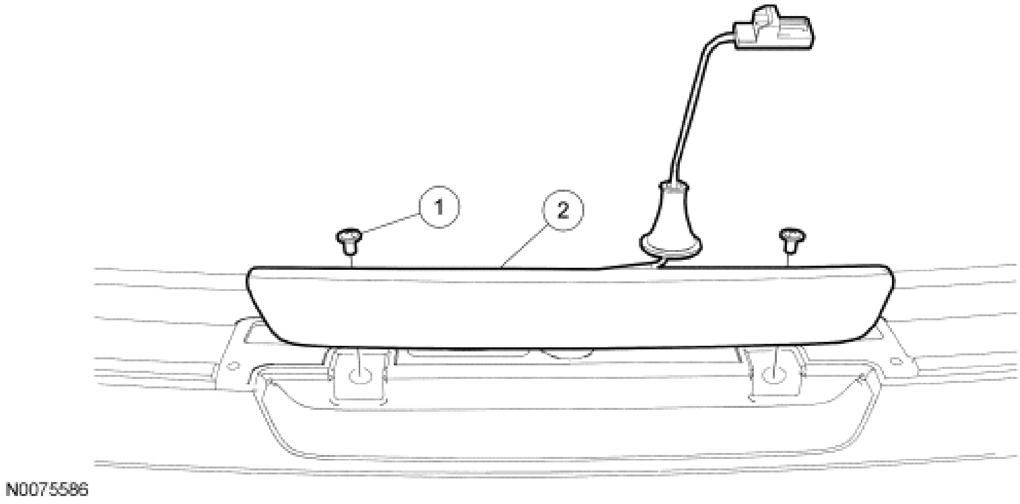

Fig. 89: Spoiler Mounted
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	High mounted stoplamp screws (2 required)
2	-	High mounted stoplamp

REMOVAL AND INSTALLATION

Parcel shelf mounted

1. Disconnect the high mounted stoplamp electrical connector from within the luggage compartment.
2. Push the high mounted stoplamp rearward to disengage the forward tabs and remove the high mounted stoplamp.

   Spoiler mounted

3. Remove the spoiler. For additional information, refer to **EXTERIOR TRIM AND ORNAMENTATION** article.
4. Remove the 2 screws and the high mounted stoplamp.

   All vehicles

5. To install, reverse the removal procedure.

REAR LAMP ASSEMBLY

NOTE: **Fusion shown, Milan and MKZ similar.**

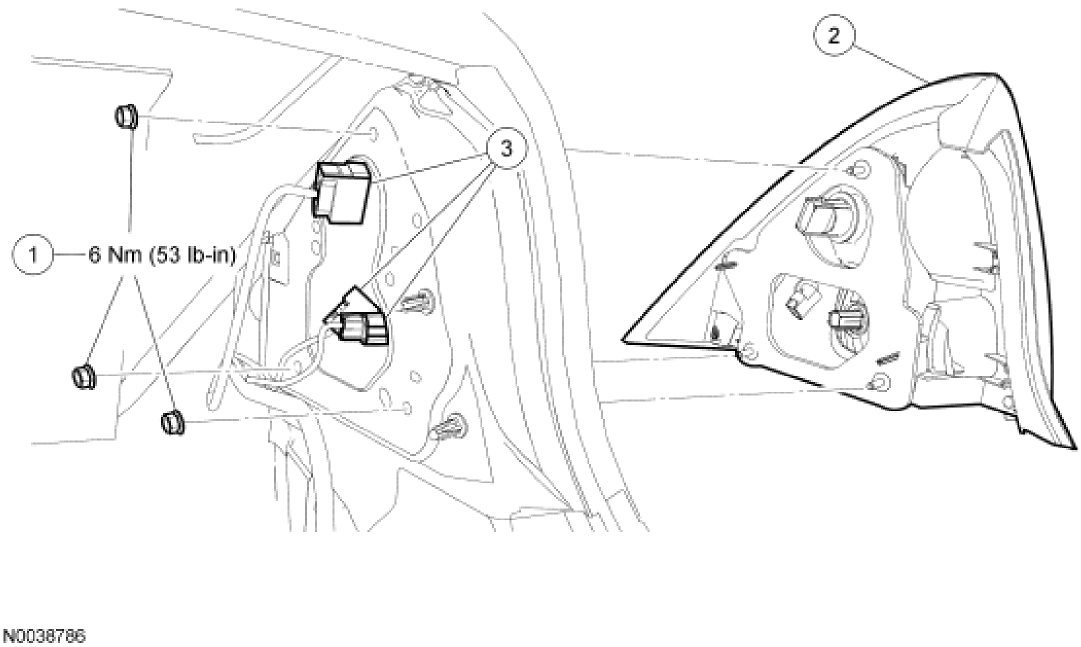

Fig. 90: Exploded View Of Rear Lamp Assembly With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W74141	Rear lamp assembly nuts (3 required)
2	13A505/13A504	Rear lamp assembly (LH/RH)
3	-	Rear lamp assembly electrical connectors (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the pin-type retainer and position the luggage compartment trim panel aside.
2. Remove the 3 nuts and the rear lamp assembly.
   - Disconnect the electrical connectors.
   - To install, tighten the nuts to 6 Nm (53 lb-in).
3. To install, reverse the removal procedure.

REVERSING LAMP

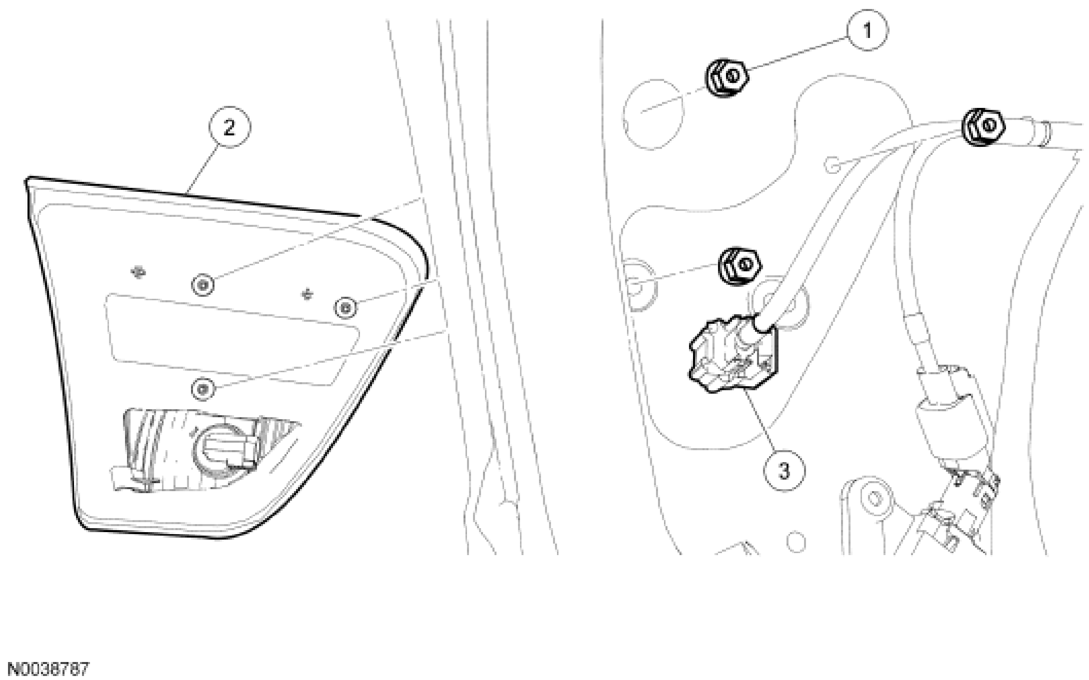

Fig. 91: Exploded View Of Reversing Lamp - Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701567	Reversing lamp nuts (3 required)
2	13404\13405	Reversing lamp (RH/LH)
3	-	Reversing lamp electrical connector (part of 14A005)

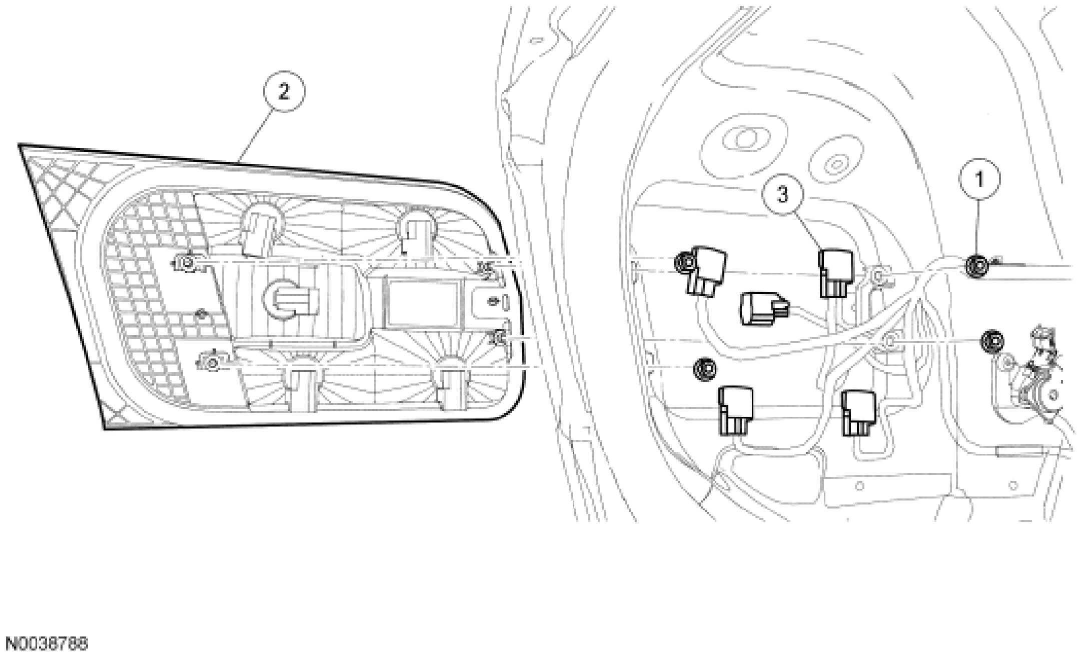

Fig. 92: Exploded View Of Reversing Lamp - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701567	Reversing lamp nuts (4 required)
2	13404\13105	Reversing lamp (RH/LH)
3	-	Reversing lamp electrical connectors (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the pin-type retainers and the luggage compartment decklid trim panel.
2. Remove the 3 nuts (Milan) or 4 nuts (MKZ) and the reversing lamp.
   - Disconnect the electrical connector(s).
3. To install, reverse the removal procedure.

REMOVAL AND INSTALLATION

RADIATOR GRILLE - MKZ

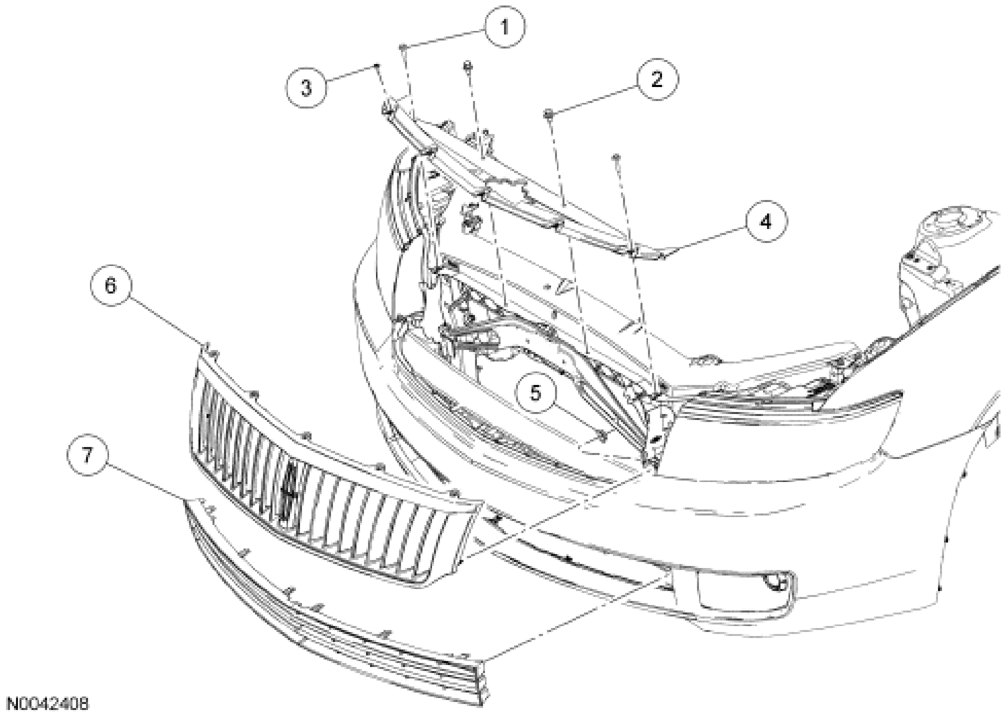

Fig. 1: Exploded View Of Radiator Grille - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N808328	Upper radiator deflector shield screw (2 required)
2	N807389	Upper radiator deflector shield pin-type retainer (2 required)
3	-	Upper radiator deflector shield-to-grille bolt (5 required)

4	8A284	Upper radiator deflector shield
5	W706805	Radiator grille nut (2 required)
6	8200A	Upper radiator grille
7	8200B	Lower radiator grille

REMOVAL AND INSTALLATION

1. Remove the 2 screws from the upper radiator deflector shield.
2. Remove the 2 pin-type retainers from the upper radiator deflector shield.
3. Remove the 5 bolts from the top of the upper radiator grille.
4. Remove the upper radiator deflector shield.
5. Remove the 2 upper radiator grille nuts.
6. Remove the upper radiator grille.
7. Remove the lower radiator grille.
   - Remove the lower radiator grille from the clips on the bumper cover.
   - Remove the lower radiator grille from the bumper cover.
8. To install, reverse the removal procedure.

RADIATOR GRILLE - MILAN

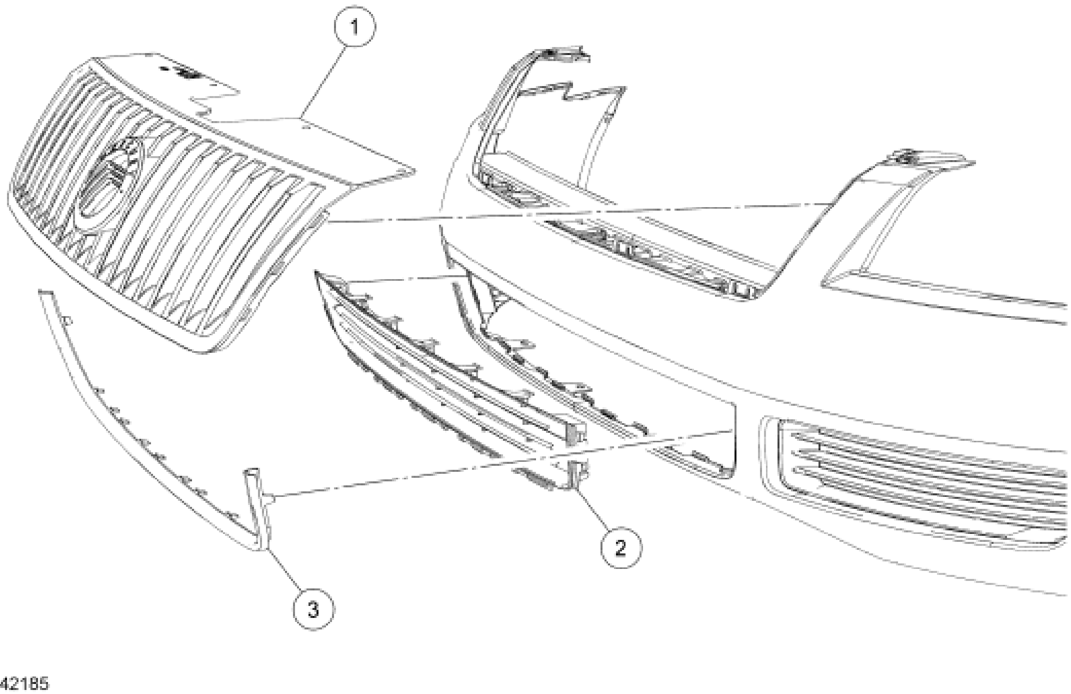

Fig. 2: Exploded View Of Radiator Grille - Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8200A	Upper radiator grille
2	8200B	Lower radiator grille
3	17K945	Lower radiator grille outer trim

1. Remove the front bumper cover. For additional information, refer to **BUMPERS** article.
2. Remove the upper radiator grille from the clips on the bumper cover.
3. Remove the lower radiator grille outer trim cover from the clips on the bumper cover.
4. Remove the lower radiator grille from the clips on the bumper cover.
5. To install, reverse the removal procedure.

RADIATOR GRILLE - FUSION

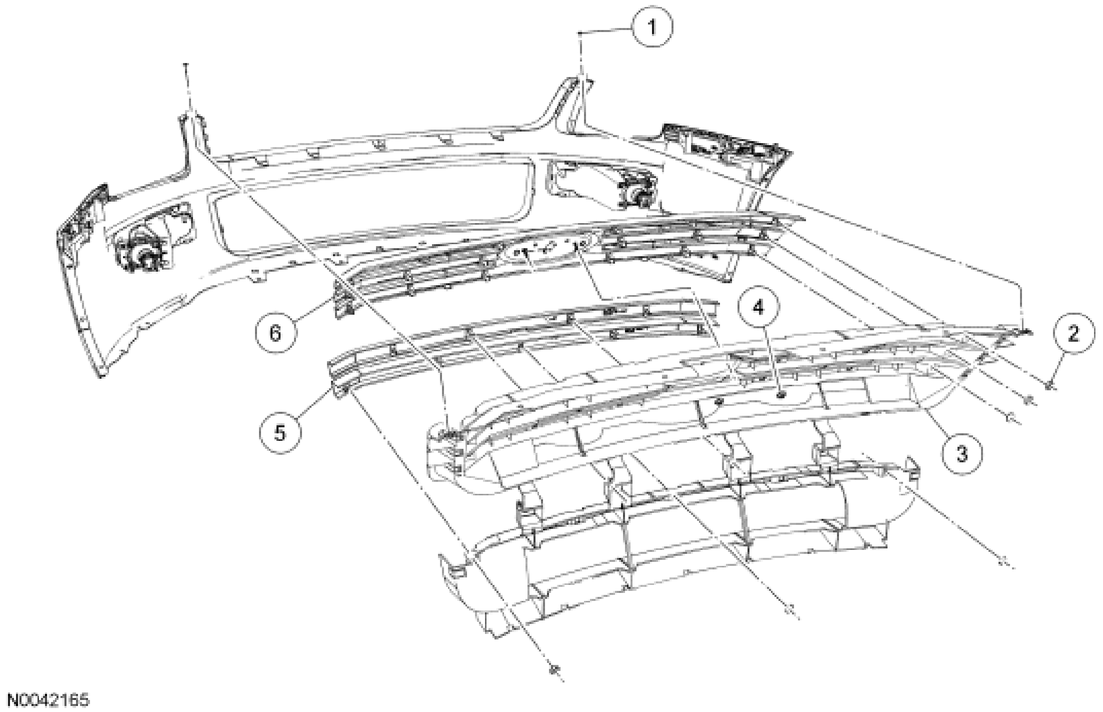

Fig. 3: Exploded View Of Radiator Grille - Fusion
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706805	Radiator grille-to-bumper cover screw (2 required)
2	-	Radiator grille nut (9 required)
3	8A284	Radiator grille reinforcement
4	W707501	Radiator grille nameplate nut (2 required)
5	8200B/8200C	Lower radiator grille
6	8200A	Upper radiator grille

1. Remove the front bumper cover. For additional information, refer to **BUMPERS** article.
2. Remove the screws from the radiator grille-to-bumper cover.
3. Disengage the radiator grille from the clips on the bumper cover.
4. Remove the radiator grille.
5. To install, reverse the removal procedure.

SPOILER

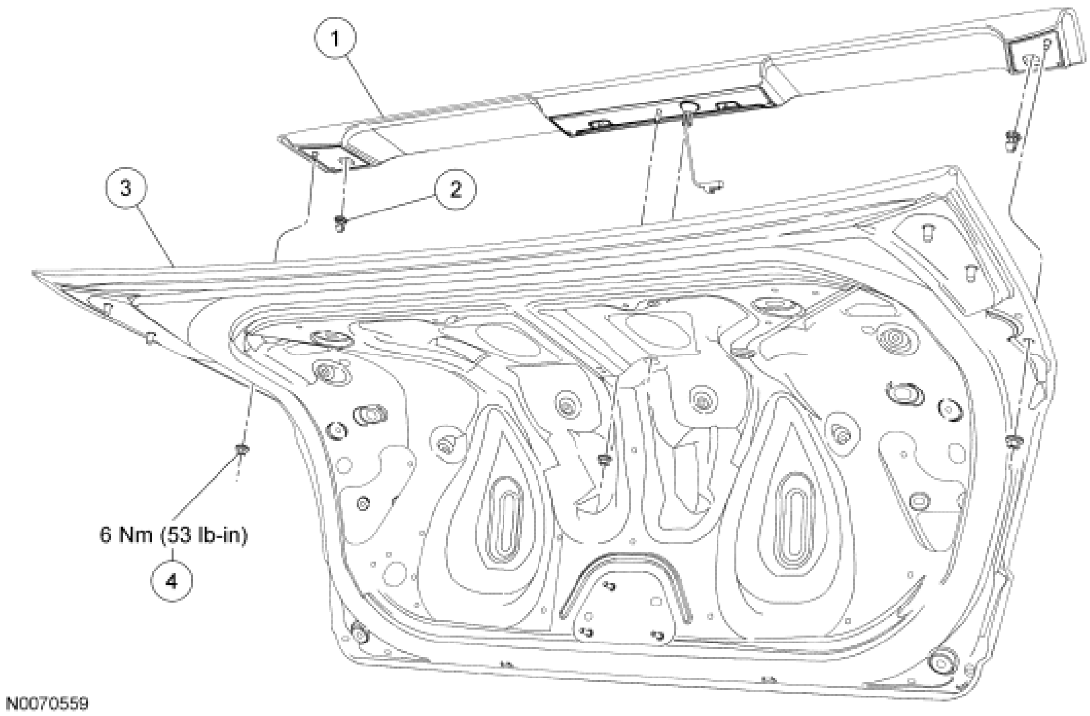

Fig. 4: Exploded View Of Spoiler
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5440602	Spoiler
2	-	Spoiler pin-type retainer (2 required)
3	5440110	Luggage compartment lid
4	N621926-S	Spoiler nut (3 required)

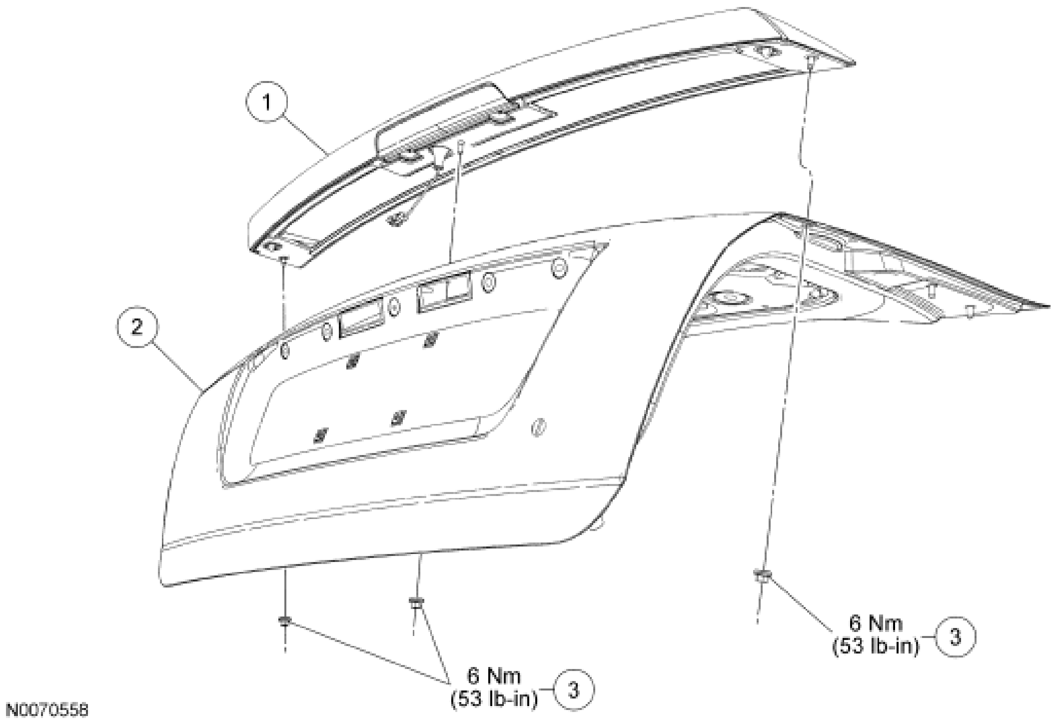

Fig. 5: Exploded View Of Spoiler With Torque Specifications - ST
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5444210	ST spoiler (less chimsel)
2	010303-40110	Luggage compartment lid
3	N621926-S	Spoiler nuts (3 required)

REMOVAL AND INSTALLATION

All vehicles

1. Open the luggage compartment lid.
2. Remove the luggage compartment lid.
   - Remove the push pin retainers.
   - Remove the insulator.
3. Disconnect the spoiler electrical connector.
4. Remove the spoiler-to-luggage compartment lid nuts.
   - To install, tighten to 6 Nm (53 lb-in).

ST spoiler only

5. Separate the tape from the luggage compartment lid along the front edge of the spoiler.

All vehicles

NOTE: **There are 2 pin-type retainers on the bottom of the spoiler. If the pin-type retainers break during removal, a new spoiler must be installed.**

NOTE: **Clean the luggage compartment lid surface prior to installing the spoiler, and press along the front edge of the spoiler after securing the fasteners to make sure of correct tape adhesion.**

6. Using a suitable tool, slide between the luggage compartment lid and the spoiler at each end until contact is made with the pin-type retainers. Push in the pin-type retainer and pull up on the spoiler to release the spoiler from the luggage compartment lid.
7. Remove the spoiler.
8. To install, reverse the removal procedure.

4X4 control module nut	9	80

DESCRIPTION AND OPERATION

FOUR WHEEL DRIVE (4WD) SYSTEMS

The All-Wheel Drive (AWD) system consists of the following:

- Power Transfer Unit (PTU)
- Rear driveshaft
- 4X4 control module (coupling device control module) (located behind the RH side instrument panel)
- Rear axle with coupling device

Torque from the engine is transferred through the transaxle to the PTU. This torque is transferred from the driveshaft to the rear axle, which drives the rear halfshafts. The AWD system, referred to as an Active Torque Coupling (ATC) system, is always active and requires no driver input.

The AWD system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is delivered to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels to prevent or control wheel slip.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, and the PTU-transaxle compression seal. No internal components are serviced. There should be no need to remove the PTU cover. If any of the internal geared components, bearings, case cover or shafts are worn or damaged, a new PTU must be installed.

DIAGNOSTIC TESTS

FOUR WHEEL DRIVE (4WD) SYSTEMS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1438-A	Flex Probe Kit	105-R025C
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Principles of Operation

The vehicle is equipped with an All-Wheel Drive (AWD) system, **also referred to as active torque coupling (ATC)** , that is always active and requires no driver input. The system has no Mode Select Switch (MSS).

The system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or if the vehicle is under heavy acceleration (high- throttle position), the AWD system increases torque to the rear wheels to prevent or control wheel slip.

The system consists of a Power Transfer Unit (PTU), 4X4 control module, rear axle and a solenoid actuated Active Torque Coupling (ATC) device. Based on the amount of current sent to the clutch, the module varies the torque sent to the rear wheels by sending a duty cycle to the ATCATC device, located inside the rear axle. For concerns with the PTU, refer to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

The 4X4 control module also provides the brake system with its current clutch duty cycle and determines whether or not the brake system may take command of the clutch duty cycle.

NOTE: The ATC solenoid is not repairable. If a new component is required, the ATC solenoid and rear axle are installed as an assembly. Refer to REAR DRIVE AXLE/DIFFERENTIAL article.

The active, on-demand AWD system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate amount of current to send to the ATC solenoid that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are:

- Accelerator pedal position via the High Speed Controller Area Network (HS-CAN)
- Transaxle range from the Transmission Control Module (TCM) via the HS-CAN
- Brake system status from the ABS module via the HS-CAN
- Wheel speed from all 4 wheels from the ABS module via the HS-CAN

4X4 control module outputs are:

- Solid-state clutch (pulse-width modulated signal) to the ATC solenoid
- Percent of torque transfer commanded signal to the ABS module via the HS-CAN
- Torque request available signal to the ABS module via the HS-CAN

Heat Protection Mode - During very extreme off-road operation, the Pulse-Width Modulation (PWM) system utilizes a heat protection mode to protect the Active Torque Coupling (ATC) solenoid (part of rear axle) from damage. If the system detects an overheat condition, it enters a locked mode. If the heat in the system continues to rise once in the locked mode, the 4X4 control module disables the ATC solenoid. Allow the system to cool down at least 10 minutes with the ignition switch in the ON position.

Inspection and Verification

1. Verify the customer concern.
2. Inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Active Torque Coupling (ATC) solenoid (part of rear axle)
• Power Transfer Unit (PTU)
• Rear Drive Unit (RDU)
• Halfshafts and CV joints
• Driveshaft and U-joints
• Fluid leaks
• Wheel/tire size and brand
	• Smart Junction Box (SJB) fuse(s):
	  ○ 20 (7.5A)
	  ○ 28 (10A)
	• 4X4 control module
	• Wiring harness
	• Connector(s)
	• Circuitry

• Matching tire size and brand • Tire pressure	

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the DTCs and carry out the self-test diagnostics for the 4X4 control module.
9. If the DTCs retrieved are related to the concern, go to the 4X4 Control Module DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart - Four Wheel Drive System**.

DTC Charts

4X4 CONTROL MODULE DTC CHART

DTC	Description	Possible Causes	Source	Action
B1317	Battery Voltage High	• Generator	4X4 Control Module	Go to **Pinpoint Test B**.
B1318	Battery Voltage Low	• Open fuse (B+) • Intermittent open on power circuit • 4X4 control module	4X4 Control Module	Go to **Pinpoint Test B**.

		connector		
B1342	Electronic Control Unit (ECU) is Faulted	• Microprocessor or internal memory fault	4X4 Control Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new 4X4 control module. REFER to **4X4 Control Module**.
B2900	Vehicle Identification Number (VIN) Mismatch	• Incorrect VIN codes received from PCM	4X4 Control Module	CHECK the PCM configuration. REFER to **MODULE CONFIGURATION** article.
P1635	Tire/Axle Out of Acceptable Range	• Incorrect size tire installed on vehicle • Wheel speed sensor failure • Flat or under-inflated tire	4X4 Control Module	Go to **Pinpoint Test F**.
P1824	Four-Wheel Drive (4WD) Clutch Relay Circuit Failure	• Short to ground on Active Torque Coupling (ATC) solenoid (part of rear axle) high circuit • 4X4 control module failure	4X4 Control Module	Go to **Pinpoint Test D**.
P1825	4WD Clutch Relay Open Circuit	• 4X4 control module harness connector • Open in ATC solenoid (part of rear axle) low circuit • Open in ATC solenoid high circuit • Short to ground on ATC solenoid low circuit • Short to ground on ATC solenoid high circuit • Open coil inside ATC solenoid • Short to voltage in ATC solenoid low circuit	4X4 Control Module	Go to **Pinpoint Test D**.

		• 4X4 control module failure		
U0100	Lost Communication with PCM	• Controller Area Network (CAN) bus fault • No data received by 4X4 control module from PCM	4X4 Control Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the lost communication with the PCM.
U0101	Lost Communication with Transmission Control Module (TCM)	• CAN bus fault • No data received by 4X4 control module from TCM module	4X4 Control Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the lost communication with the TCM.
U0121	Lost Communication with Anti-lock Brake System (ABS) Control Module	• CAN bus fault • No data received by 4X4 control module from ABS module	4X4 Control Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the lost communication with the ABS control module.
U0155	Lost Communication with IC Control Module	• High Speed Controller Area Network (HS-CAN) fault • No data received from the IC by the 4X4 control module	4X4 Control Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the lost communication with the IC.
U0401	Invalid Data Received From PCM	• Invalid data received from PCM • Data out of range	4X4 Control Module	REFER to **Introduction - Gasoline Engines** article to diagnose the accelerator position, engine coolant or keep alive memory fault.
U0402	Invalid Data Received From TCM	• Invalid data received from TCM • Data out of range	4X4 Control Module	REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article to diagnose the Transmission Range (TR).
U0415	Invalid Data Received From Anti-lock Brake System (ABS) Control Module	• Invalid data received from ABS module • Data out of range	4X4 Control Module	Go to **Pinpoint Test C**.
U2050	No Application Present	• Application software is not present • Application software update	4X4 Control Module	CONFIGURE the 4X4 control module. REFER to **MODULE CONFIGURATION** article to CARRY OUT Programmable Module Installation (PMI).

		failed • 4X4 control module failed		CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again, INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. REPEAT the self-test.
U2051	One or More Calibration Files Missing/Corrupt	• Calibration software not present • Calibration software update failed • 4X4 control module failed	4X4 Control Module	CONFIGURE the 4X4 control module. REFER to **MODULE CONFIGURATION** article to CARRY OUT PMI. CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2051 is retrieved again, INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. REPEAT the self-test.

Symptom Chart - Four-Wheel Drive (4WD) System

Symptom Chart - Four-Wheel Drive (4WD) System

Condition	Possible Sources	Action
• Unable to duplicate customer concern; no DTCs present	• The concern description is inaccurate	• CARRY OUT the AWD System Functional Test. Go to **Pinpoint Test A**.
• Battery voltage is high/low (4X4 control module)	• Concern with voltage regulator or generator • Smart Junction Box (SJB) fuse 20 (7.5A) • SJB fuse 28 (10A) • Intermittent open power circuit • 4X4 control module internal relay failure	• Go to **Pinpoint Test B**.
• 4X4 control module received no/invalid data from PCM	• Invalid data received from PCM • Data out of range	• REFER to **Introduction - Gasoline Engines** article to diagnose the accelerator position, engine coolant or keep alive memory fault.
• 4X4 control module received no/invalid data from ABS module	• Invalid data received from the ABS module • Data out of range	• Go to **Pinpoint Test C**.

• High Speed Controller Area Network (HS-CAN) communications bus fault	• HS-CAN bus fault • PCM fault • ABS fault • Instrument Cluster (IC) fault • Transmission Control Module (TCM) fault • 4X4 control module	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• Vehicle has no or inadequate torque at rear wheels	• Rear axle	• REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Power Transfer Unit (PTU) mechanical failure	• REFER to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

	• ABS module	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.
	• 4X4 control module	

	• ATC solenoid (part of rear axle) • Circuitry	• Go to **Pinpoint Test E**.
• Tire/axle out of acceptable range	• Wheels/tires • Wheel speed sensors • ABS module • 4X4 control module	• Go to **Pinpoint Test F**.

Pinpoint Tests

Pinpoint Test A: All-Wheel Drive (AWD) System Functional Test

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is delivered to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels to prevent or control wheel slip.

This pinpoint test is intended to diagnose the following:

- AWD system concern without on-demand or continuous DTCs

PINPOINT TEST A: All-Wheel Drive (AWD) SYSTEM FUNCTIONAL TEST

WARNING: **When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.**

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.

A1 CHECK FOR WRENCH LIGHT PROVE-OUT

- Turn the ignition to the ON position and observe the wrench light.
- **Does the wrench light illuminate for 3 seconds and then turn OFF?**

  YES : Go to A2.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article for further diagnosis of the Instrument Cluster (IC).

A2 CHECK FOR Active Torque Coupling (ATC) SOLENOID (PART OF REAR AXLE) LOCK

- Drive the vehicle on a dry, hard surface in turns while applying the accelerator pedal.

- **Is driveline wind-up present in turns?**

  YES : With the ignition switch in ON position, allow the ATC solenoid to cool down for at least 10 minutes and repeat the test. CHECK for wind-up again. If no wind-up is found, Go to A3. If still present, go to **Pinpoint Test E**.

  NO : Go to A3.

A3 CHECK FOR VALID ACCELERATOR PEDAL POSITION MONITORING THE ACCELERATOR PEDAL POSITION (AP) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor the AP PID while pressing the accelerator pedal.
- **Does the accelerator pedal position match the AP PID percent value?**

  YES : Go to A4.

  NO : REFER to the **Introduction - Gasoline Engines** article to diagnose the accelerator pedal position sensor concern.

A4 CHECK 4X4 CONTROL MODULE WHEEL SPEED SENSOR PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Are all 4 wheel speeds within 2 km/h (1.2 mph) of each other?**

  YES : Go to A5.

  NO : Go to **Pinpoint Test F**.

A5 CHECK VEHICLE ACCELERATION IN A STRAIGHT LINE

- Carry out 3 accelerations from 0-48 km/h (0-30 mph) in a straight line (one each with low, medium and full accelerator pedal application).
- **Does the vehicle pulsate or shudder while accelerating?**

  YES : Go to **Pinpoint Test E**.

  NO : Go to A6.

A6 CHECK VEHICLE TURNING ABILITY

- Drive the vehicle in a fully locked turn, on dry pavement, at 8 km/h (5 mph).
- **Does the vehicle bind in the turn or resist turning?**

  YES : Go to **Pinpoint Test E**.

  NO : Go to A7.

A7 CHECK FOR TORQUE AT REAR WHEELS USING PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Using the scan tool, command CLCH_ SOL to energize the ATC solenoid to a constant 100% applied.

- Drive the vehicle in a fully locked turn, on dry pavement, at 8 km/h (5 mph).
- **Does the vehicle bind in the turn or resist turning?**

  YES : END the active command. The concern cannot be duplicated at this time. RETURN the vehicle to the customer.

  NO : END the active command. CHECK that the driveshaft rotates when the transaxle is in gear. If yes, go to **Pinpoint Test D**. If no, CHECK the Power Transfer Unit (PTU). REFER to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

Pinpoint Test B: DTC B1317/B1318 - Battery Voltage is High/Low (4X4 Control Module)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

If the 4X4 control module observes an overpower or under power voltage condition, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

- DTC B1317 Battery Voltage High - When the 4X4 control module detects battery voltage greater than 16 volts for at least 10 seconds, this DTC is set.
- DTC B1318 Battery Voltage Low - When the 4X4 control module detects battery voltage less than 9 volts for at least 10 seconds, with the engine running at 1,500 RPM or greater, this DTC is set.

This pinpoint test is intended to diagnose the following:

- Fuses
- Wiring, terminals or connectors
- 4X4 control module

PINPOINT TEST B: DTC B1317/B1318 - BATTERY VOLTAGE IS HIGH/LOW (4X4 CONTROL MODULE)

NOTE:	**DTCs B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.**

NOTE:	**Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification.**

B1 RETRIEVE ALL CONTINUOUS MEMORY DTCs (CMDTCs) IN ALL MODULES

- Enter the following diagnostic mode on the diagnostic tool: Self Test - All CMDTCs
- **Is B1317, B1318 or B1676 present in more than one module AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**

YES : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article for diagnosis of the battery and charging system.

NO : Go to B2.

B2 CHECK BATTERY CONDITION

- Refer to **BATTERY, MOUNTING AND CABLES** article and carry out the Battery - Condition Test.
- **Does the battery pass the condition test?**

  YES : If the battery passed the condition test but required a recharge, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the charging system. CLEAR all continuous memory DTCs. TEST the system for normal operation.

  If the battery passed the condition test and did not require a recharge, go to B3.

  NO : INSTALL a new battery. CLEAR all continuous memory DTCs. TEST the system for normal operation.

B3 CHECK THE CHARGING SYSTEM VOLTAGE

NOTE:	**Do not allow the engine RPM to increase above 2,000 RPM while performing this step or the generator may self excite and result in default charging system output voltage. If engine RPM has gone above 2,000 RPM, shut the vehicle off and restart the engine before performing this step.**

- Start the engine.

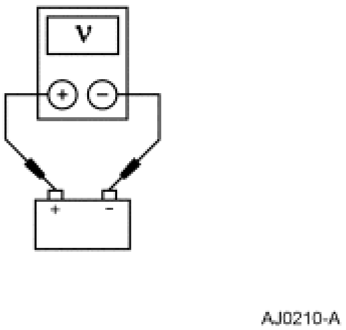

Fig. 1: Checking Charging System Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage of the battery.
  - For DTC B1317, turn off all accessories and run the engine at 1,500 RPM for a minimum of 2 minutes.
  - For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 RPM for a minimum of 2 minutes.
- **Is the battery voltage between 13-15.2 volts?**

  YES : Go to B4.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the

charging system. CLEAR all continuous memory DTCs. TEST the system for normal operation.

B4 CHECK FOR VOLTAGE BY MONITORING THE MODULE SUPPLY VOLTAGE (VBAT_4X4) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- With the engine running, monitor the battery voltage VBAT_4X4 PID.
- **Is the battery voltage less than 9 or greater than 15.5 volts?**

  YES : If voltage is less than 9 volts, go to B5.

  If voltage is greater than 15.5 volts, INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. CLEAR all continuous memory DTCs. REPEAT the self-test.

  NO : Go to B7.

B5 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: 4X4 Control Module C3253
- Measure the resistance between 4X4 control module C3253-15, circuit GD126 (BK/WH), harness side and ground.

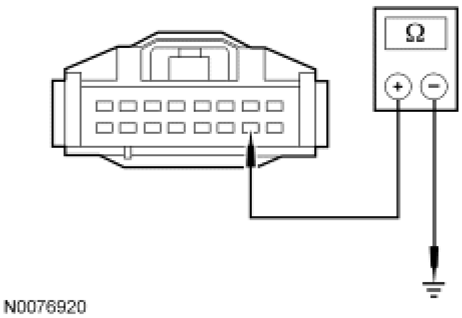

Fig. 2: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Repeat this measurement while wiggling the harness.
- **Is the resistance less than 5 ohms?**

  YES : Go to B6.

  NO : REPAIR the circuit. CLEAR all continuous memory DTCs. REPEAT the self-test.

B6 CHECK POWER TO 4X4 CONTROL MODULE

- Key in ON position.

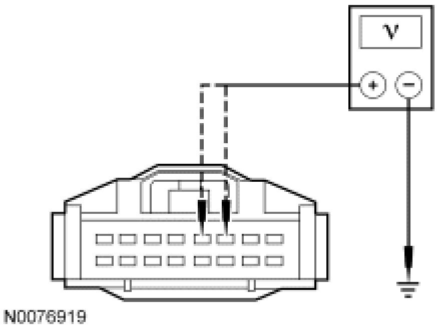

Fig. 3: Checking Power To 4X4 Control Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between 4X4 control module C3253-6, circuit SBP15 (WH/RD), harness side and ground; and between 4X4 control module C3253-5, circuit CBP19 (BN/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to B7.

  NO : VERIFY the Smart Junction Box (SJB)fuse(s) 20 (7.5A) and 28 (10A) are OK. If fuse(s) are OK, REPAIR the circuit in question. If SJB fuse(s) are not OK, REFER to the Wiring Diagram Manual to identify possible causes of the circuit short. CLEAR all continuous memory DTCs. REPEAT the self-test.

B7 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect the 4X4 control module.
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. CLEAR the continuous memory DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous memory DTCs. REPEAT the self-test.

Pinpoint Test C: DTC U0415 - 4X4 Control Module Received No/Invalid Data From ABS Module

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the Active Torque

Coupling (ATC) solenoid (part of rear axle) that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are: accelerator pedal position output from the PCM, transmission range from the Transmission Control Module (TCM), brake system status and all 4 wheel speeds from the ABS module. Communication between the 4X4 control module and other modules is obtained through the High Speed Controller Area Network (HS-CAN). If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

- DTC U0415 Invalid Data Received from Anti-lock Brake System (ABS) Control Module - When the 4X4 control module receives invalid HS-CAN bus data or invalid wheel speed(s) from the ABS module for more than 5 seconds, this DTC is set.

This pinpoint test is intended to diagnose the following:

- ABS module

PINPOINT TEST C: DTC U0415 - 4X4 CONTROL MODULE RECEIVED NO/INVALID DATA FROM ABS MODULE

WARNING: **When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.**

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.

C1 CHECK FOR ABS MODULE DTCs

- Key in ON position.
- Carry out the ABS module self-test.
- Review the results of the ABS module self-test.
- **Are any DTCs present?**

  YES : REFER to **VEHICLE DYNAMIC SYSTEMS** article for further diagnosis of the ABS.

  NO : Go to C2.

C2 CHECK WHEEL SPEED SENSORS PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Do the 4 wheel speed sensors match the speedometer and are they within 2 km/h (1.2 mph) of each other?**

  YES : The system is operating correctly at this time. CLEAR the DTCs. REPEAT the self-test.

  NO : INSPECT for proper tire size and tire inflation. If no concerns with the tires are found,

REFER to **VEHICLE DYNAMIC SYSTEMS** article for further diagnosis of the ABS.

Pinpoint Test D: DTCs P1824/P1825 - 4-Wheel Drive Clutch Relay Circuit Failure/4-Wheel Drive Clutch Relay Open Circuit or Inadequate Torque at Rear Wheels

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the Active Torque Coupling (ATC) solenoid (part of rear axle) that delivers the desired torque to the rear wheels. If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

- DTC P1824 4-Wheel Drive Clutch Relay Circuit Failure - When the 4X4 control module detects a short to ground on the ATC solenoid feedback circuit, this DTC is set.
- DTC P1825 4-Wheel Drive Clutch Relay Open Circuit - When the 4X4 control module detects an open or short to ground on the ATC solenoid command or feedback circuit for more than 2 seconds, this DTC is set.

This pinpoint test is intended to diagnose the following:

- Tire/axle out of range
- ATC solenoid (part of rear axle)
- 4X4 control module
- Power Transfer Unit (PTU)
- Wiring, terminals or connectors

PINPOINT TEST D: DTCs P1824/P1825 - 4-WHEEL DRIVE CLUTCH RELAY CIRCUIT FAILURE/4-WHEEL DRIVE CLUTCH RELAY OPEN CIRCUIT OR INADEQUATE TORQUE AT REAR WHEELS

NOTE:	**Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.**

D1 CHECK FOR 4X4 CONTROL MODULE DTCs

- Key in ON position.
- Carry out the 4X4 control module self-test.
- **Are any DTCs received?**

  YES : For DTC P1824 or P1825, go to D2.

  For all other DTCs, REFER to the **DTC Charts**.

  NO : Go to D2.

D2 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR A SHORT TO GROUND WITH ATC SOLENOID (PART OF REAR AXLE) CONNECTED

- Key in OFF position.
- Disconnect: 4X4 Control Module C3253

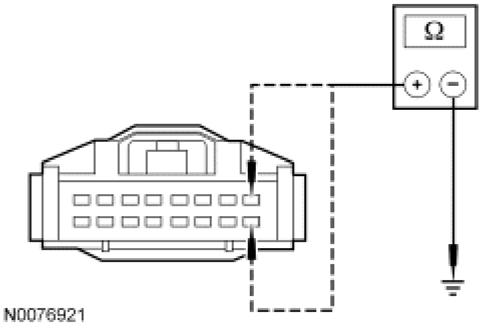

Fig. 4: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For A Short To Ground With ATC Solenoid Connected
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and ground; and between 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D5.

  NO : Go to D3.

D3 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR A SHORT TO GROUND WITH C3051 DISCONNECTED

- Disconnect: ATC Solenoid Jumper Harness C3051

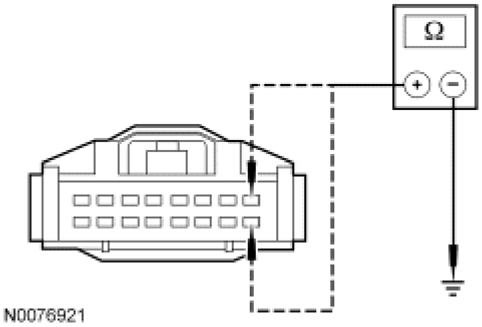

Fig. 5: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For A Short To Ground With C3051 Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and ground; and between 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D4.

  NO : REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

D4 CHECKING THE ATC SOLENOID JUMPER HARNESS

NOTE:	**The ATC solenoid jumper harness must be secured to prevent damage to the wiring.**

- Disconnect: ATC Solenoid C3254
- Inspect the ATC solenoid jumper harness for damage.
- **Is the ATC solenoid jumper harness damaged?**

  YES : REPAIR or INSTALL a new ATC solenoid jumper harness. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new rear axle assembly. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. CLEAR the DTCs. REPEAT the self-test.

D5 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR AN OPEN WITH ATC SOLENOID CONNECTED

- Connect: ATC Solenoid C3254 and ATC Solenoid Jumper Harness C3051

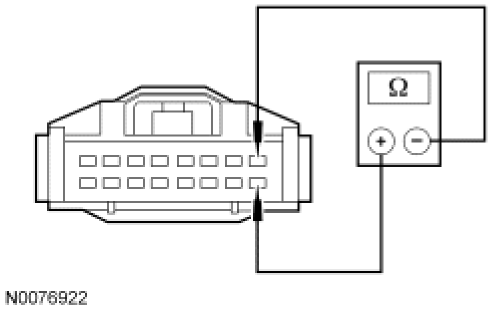

Fig. 6: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For An Open With ATC Solenoid Connected
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side.
- **Is the resistance less than 10 ohms?**

  YES : Go to D8.

  NO : Go to D6.

D6 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR AN OPEN AT C3051

- Disconnect: ATC Solenoid Jumper Harness C3051

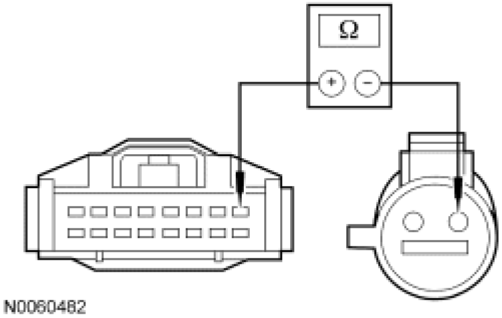

Fig. 7: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For An Open At C3051
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and ATC solenoid jumper harness C3051-1, circuit CCF21 (VT/WH).
- Repeat this measurement while wiggling the harness.

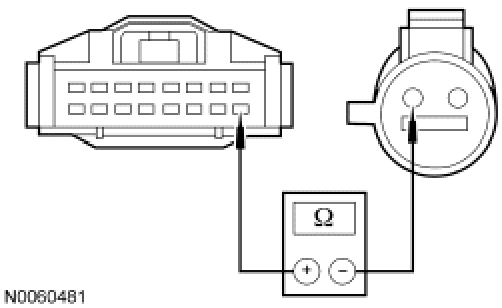

Fig. 8: Measuring Resistance Between 4X4 Control Module C3253-8, Circuit CCF21 (VT/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side and ATC solenoid jumper harness C3051-2, circuit RCF21 (WH/VT), harness side.
- Repeat this measurement while wiggling the harness.
- **Are the resistances less than 5 ohms?**

  YES : Go to D7.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D7 CHECK THE ATC SOLENOID CIRCUIT FOR AN INTERNAL OPEN

NOTE: The ATC solenoid jumper harness must be secured to prevent damage to the wiring.

- Disconnect: ATC Solenoid C3254

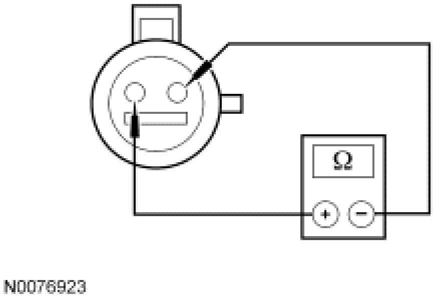

Fig. 9: Checking ATC Solenoid Circuit For An Internal Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between ATC solenoid C3254-1, circuit CCF21 (VT/WH), component side, and ATC solenoid C3254-2, circuit RCF21 (WH/VT), component side.
- Repeat this measurement while wiggling the harness.
- **Is the resistance less than 10 ohms?**

  YES : REPAIR or INSTALL a new ATC solenoid jumper harness. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new rear axle assembly. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. CLEAR the DTCs. REPEAT the self-test.

D8 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

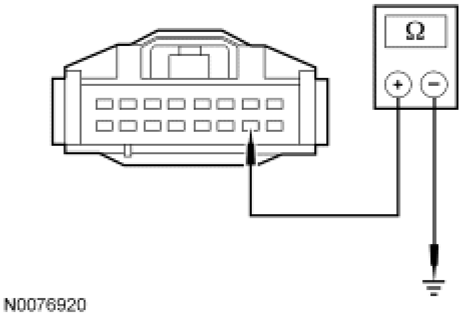

Fig. 10: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C3253-15, circuit GD126 (BK/WH), harness side and ground.
- Repeat this measurement while wiggling the harness.
- **Is the resistance less than 5 ohms?**

  YES : Go to D9.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D9 CHECK THE 4X4 CONTROL MODULE POWER CIRCUITS

- Key in ON position.

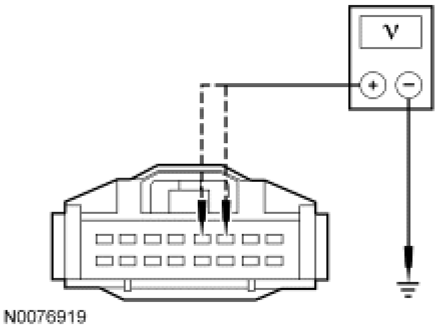

Fig. 11: Checking 4X4 Control Module Power Circuits
Courtesy of FORD MOTOR CO.

- Measure the voltage between 4X4 control module C3253-6, circuit SBP15 (WH/RD), harness side and ground; and between 4X4 control module C3253-5, circuit CBP19 (BN/WH), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to D10.

  NO : CHECK Smart Junction Box (SJB) fuses 20 (7.5A) and 28 (10A). REPAIR the circuit in question for open or short to ground. CLEAR the DTCs. REPEAT the self-test.

D10 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect: 4X4 Control Module C3253
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Check the ATC solenoid jumper harness between the 4X4 control module and the ATC solenoid, located on the rear subframe.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: Vehicle Binds in a Turn or Resists Turning/Pulsates or Shudders in a Straight Line

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the

torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels.

This pinpoint test is intended to diagnose the following:

- Rear axle
- Wheels/tires
- PCM
- ABS module
- 4X4 control module
- Circuitry

PINPOINT TEST E: VEHICLE BINDS IN A TURN OR RESISTS TURNING/PULSATES OR SHUDDERS IN A STRAIGHT LINE

NOTE: **Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.**

E1 CHECK FOR TORQUE AT THE REAR WHEELS

- Key in OFF position.
- Disconnect: Active Torque Coupling (ATC) Solenoid (part of rear axle) C3254
- Drive the vehicle in a straight line on dry pavement.
- **Is a pulsation or shudder still present?**

  YES : REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article for additional axle diagnosis.

  NO : Go to E2.

E2 CHECK TO SEE IF THE ATC SOLENOID IS BEING COMMANDED ON MONITORING Four-Wheel Drive (4WD) CLUTCH PWM STATUS (4WDCPWMST) PID

- Key in OFF position.
- Connect: ATC Solenoid C3254
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor the 4WDCPWMST PID.
- Drive the vehicle no faster than 8 km/h (5 mph) in tight turns on dry pavement while monitoring the ATC solenoid duty cycle.
- **Is the duty cycle greater than 20%?**

  YES : Go to E3.

  NO : Go to **Pinpoint Test F**.

E3 CHECK FOR THE CORRECT WHEEL SPEEDS USING THE WHEEL SPEED SENSORS PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module

- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Are all 4 wheel speeds within 2 km/h (1.2 mph) of each other?**

  YES : Go to E4.

  NO : Go to **Pinpoint Test F**.

E4 CHECK FOR VALID ACCELERATOR PEDAL POSITION MONITORING ACCELERATOR PEDAL POSITION (AP) PID

- Key ON Engine OFF (KOEO).
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor AP PID while pressing/releasing the accelerator pedal.
- **Does the accelerator position match the PID percent value?**

  YES : Go to E5.

  NO : REFER to the **Introduction - Gasoline Engines** article to diagnose the engine control system.

E5 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect the 4X4 control module.
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Check the ATC solenoid jumper harness between the 4X4 control module and the ATC solenoid, located on the rear subframe.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC P1635 - Tire/Axle Out of Acceptable Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the

torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels.

- DTC P1635 Tire/Axle Out of Acceptable Range - When the 4X4 control module detects inappropriate mini spare or road wheels/tires (greater than 7% across the front and rear axle or 14% at one wheel) installed, this DTC is set.

This pinpoint test is intended to diagnose the following:

- Wheels/tires
- Wheel speed sensors
- ABS module
- 4X4 control module

PINPOINT TEST F: DTC P1635 - TIRE/AXLE OUT OF ACCEPTABLE RANGE

WARNING: **When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.**

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.

F1 CHECK THE RECENT TIRE USAGE

- Check with customer about recent tire usage or installation.
- **Has a tire been installed on the vehicle recently that was not originally supplied with the vehicle?**

  YES : INFORM the customer to only use tires of the type supplied with the vehicle. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to F2.

F2 CHECK TIRE SIZE AND BRAND

- Check the tire size and the brand of tire.
- **Are all 4 tires the same size and brand?**

  YES : Go to F3.

  NO : INSTALL tires that are the same size and brand. INFORM the customer to only use the same size tires and brand. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK TIRE AIR PRESSURES

- Check the air pressure in all 4 tires.
- **Are all 4 tires at the recommended air pressure?**

  YES : Go to F4.

  NO : ADJUST the tire air pressures. CLEAR the DTCs. REPEAT the self-test. INFORM the customer to maintain the correct tire air pressure.

F4 CHECK FOR CORRECT WHEEL SPEEDS

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
    - Left Front Wheel Speed Sensor (LF_WSPD)
    - Left Rear Wheel Speed Sensor (LR_WSPD)
    - Right Front Wheel Speed Sensor (RF_WSPD)
    - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Are all 4 wheel speeds within 2 km/h (1.2 mph) of each other?**

  YES : Go to F5.

  NO : The ABS module is sending invalid wheel speed data to the 4X4 control module. REFER to **VEHICLE DYNAMIC SYSTEMS** article for additional ABS diagnosis.

F5 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect: 4X4 Control Module C3253
- Check for:
    - corrosion.
    - pushed-out pins.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 Control Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

REMOVAL AND INSTALLATION

4X4 CONTROL MODULE

REMOVAL AND INSTALLATION

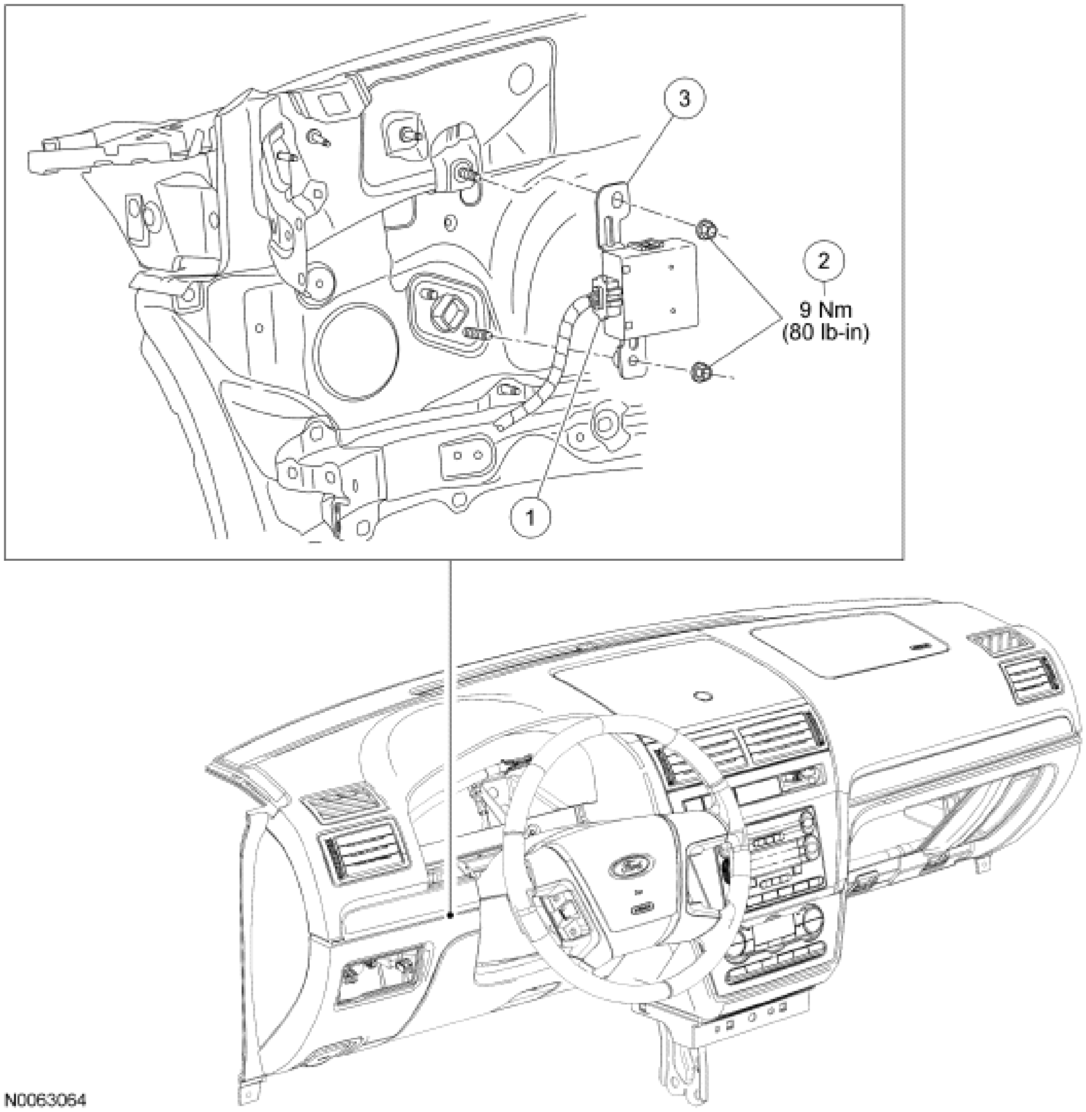

Fig. 12: Exploded View Of 4X4 Control Module With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Electrical connector (part of 14A005)
2	W706840-S	4X4 control module nuts and washers (2 required)
3	7E453	4X4 control module and bracket assembly

1. From below the LH side instrument panel, disconnect the 4X4 control module harness connector.
2. Remove the two 4X4 control module nuts.
   - To install, tighten to 9 Nm (80 lb-in).
3. Remove the 4X4 control module and bracket.

4. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

FRONT DISC BRAKE

The front brake disc system consists of the following components:

- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake disc shield
- Brake flexible hose

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing of wheel rotation and the vehicle.

DIAGNOSTIC TESTS

FRONT DISC BRAKE

Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

BRAKE PADS

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

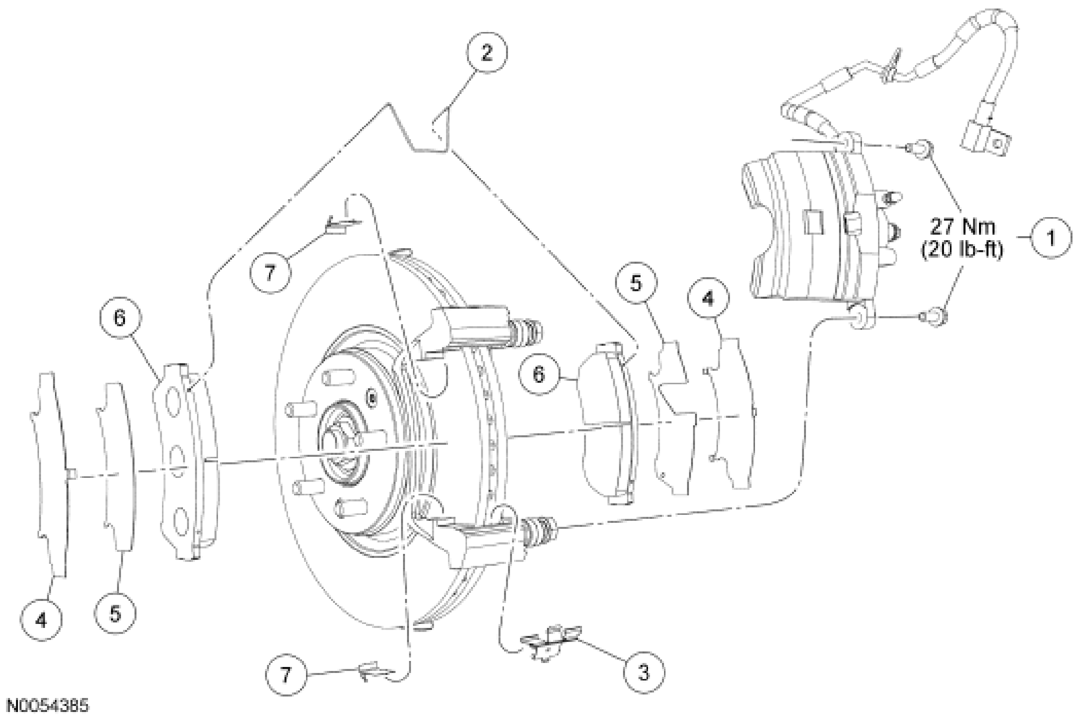

Fig. 1: Exploded View Of Brake Pads With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Brake caliper guide pin bolts (2 required) (part of 2L527)
2	-	Brake pad retraction spring (2 required) (part of 2001)
3	-	Brake pad slide (2 required) (part of 2001)
4	-	Stainless steel shims (2 required) (part of 2001)
5	-	Brake pad shims (2 required) (part of 2001)
6	2001	Brake pads (2 required)
7	-	Brake pad slide clips (4 required) (part of 2001)

REMOVAL

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information,**

consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: **Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.**

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

1. Check the brake fluid level in the brake master cylinder reservoir.
   - If required, remove the fluid until the brake master cylinder reservoir is 1/2 full.
2. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

NOTE: Do not pry in the caliper sight hole to retract the pistons as this can damage the pistons and boots.

NOTE: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

3. Remove the 2 brake caliper guide pin bolts and position the caliper aside.
   - Support the caliper using mechanic's wire.
4. Remove the 2 brake pad retraction springs.
5. Remove the brake pads, brake pad shims and stainless steel shims.
   - Inspect the brake pads and shims for wear or contamination.
6. Remove the brake pad slides.
7. Remove the 4 brake pad slide clips.

INSTALLATION

1. Install the 4 brake pad slide clips.

NOTE: Protect the piston and boots when pushing the caliper piston into the caliper piston bores or damage to components may occur.

NOTE: Make sure that the caliper guide pin boots are fully seated or damage to the caliper guide pin boots can occur.

2. If installing new brake pads, using a C-clamp and a worn brake, compress the disc brake caliper pistons into the caliper.

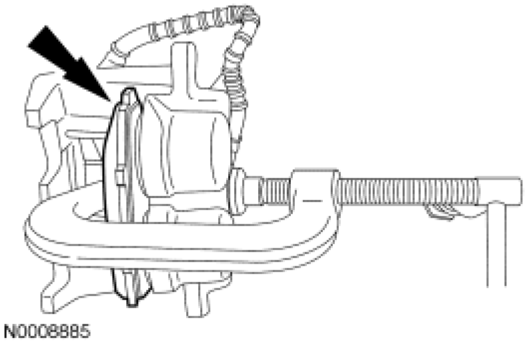

Fig. 2: Compressing Brake Caliper Pistons Into Caliper
Courtesy of FORD MOTOR CO.

3. Install the brake pad slides.
4. Apply grease that is supplied to the pad backing plate and shims in the areas indicated.
    1. Apply grease to the back of the brake pad.
    2. Apply grease to the inner piston side stainless steel shim.
    3. Apply grease to the outer stainless steel shim.

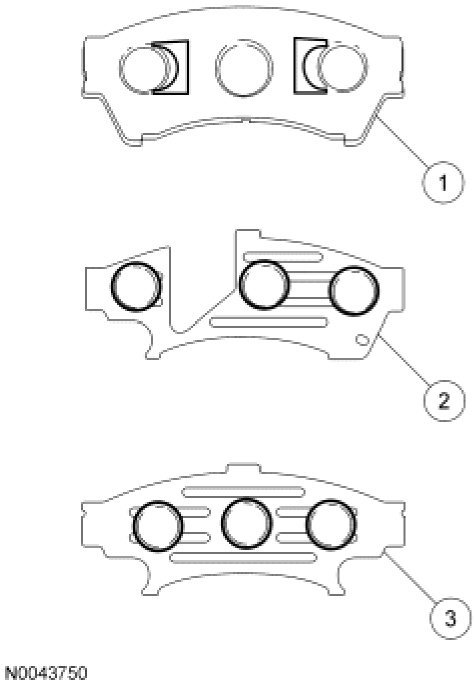

Fig. 3: Identifying Pad Backing Plate And Shims
Courtesy of FORD MOTOR CO.

NOTE: **LH inboard shim shown.**

NOTE: **The cut shim is directional and used on the inboard pad only. The cut is**

positioned toward the leading side. Correct installation can be verified if the shim hole is positioned on the bottom side.

5. Install the brake pad shims and the stainless steel shims to the brake pads.

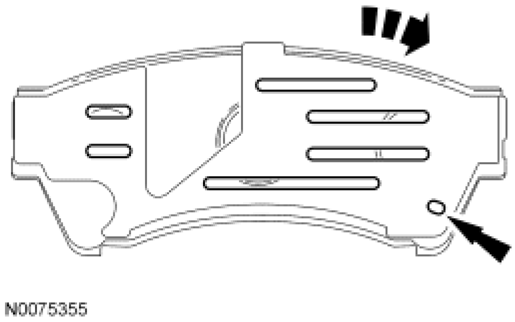

Fig. 4: Installing Brake Pad Shims & Stainless Steel Shims To Brake Pads
Courtesy of FORD MOTOR CO.

6. Install the 2 brake pad retraction springs.

NOTE: The caliper guide pin boots must be seated correctly on the anchor plate or the guide pins may become contaminated.

7. Inspect the guide pin boots and make sure they are seated on the anchor plate correctly. The boot has a lip that fits under the edge of the anchor plate extension.

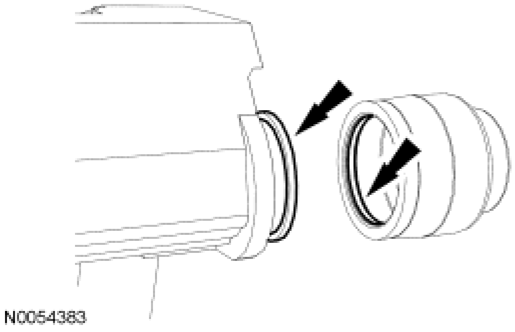

Fig. 5: Inspecting Guide Pin Boots & Making Sure They Are Seated On Anchor Plate Correctly
Courtesy of FORD MOTOR CO.

NOTE: Make sure that the brake caliper hose does not become twisted.

8. Position the brake caliper and install the 2 guide pin bolts.
   - Tighten to 27 Nm (20 lb-ft).
9. Fill the brake master cylinder reservoir with clean, specified brake fluid.
10. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
    - Apply brakes several times to verify correct brake operation.

BRAKE CALIPER

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

2	2M085	Brake caliper flow bolt
3	99562	Copper washers (2 required)
4	2078 RH/ 2B557 LH	Front brake hose
5	2B120 RH/ 2B121 LH	Brake caliper
6	2L126	Bleeder screw cap

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system**

contamination, brake component damage and the risk of serious personal injury.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Remove the brake caliper flow bolt and position the hose aside.
    - Discard the 2 copper washers.
    - To install, tighten to 25 Nm (18 lb-ft).
3. Remove the 2 brake caliper guide pin bolts.
    - To install, tighten to 27 Nm (20 lb-ft).
4. Remove the brake caliper.
    - If a leaking or damaged caliper piston boot is found, install a new brake caliper.

NOTE: **The caliper guide pin boots must be seated correctly on the anchor plate or the guide pins may become contaminated.**

5. Inspect the guide pin boots and make sure they are seated on the anchor plate correctly. The boot has a lip that fits under the edge of the anchor plate extension.

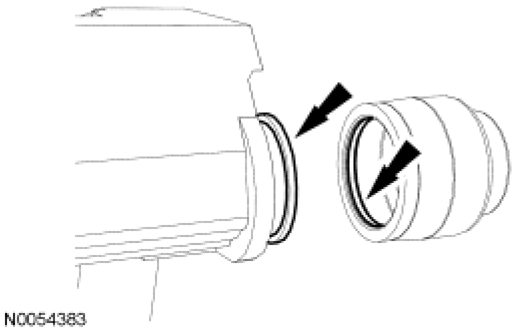

Fig. 7: Inspecting Guide Pin Boots & Making Sure They Are Seated On Anchor Plate Correctly
Courtesy of FORD MOTOR CO.

NOTE: **During installation, make sure that the brake caliper hose does not become twisted.**

6. To install, reverse the removal procedure.
   - Install new copper washers.
   - Bleed the brake caliper. For additional information, refer to Component Bleeding in **BRAKE SYSTEM - GENERAL INFORMATION** article.

BRAKE CALIPER ANCHOR PLATE

2	2B292	Brake caliper and anchor plate assembly
3	W505741	Brake disc screws (2 required)
4	1032	Brake disc

REMOVAL AND INSTALLATION

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

NOTE: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

2. Remove the brake caliper anchor plate bolts and position the brake caliper, pads and anchor plate aside as an assembly.
   - Support the caliper using mechanic's wire.
   - To install, tighten the bolts to 90 Nm (66 lb-ft).
3. Remove the 2 brake disc screws.
   - To install, tighten to 20 Nm (177 lb-in).
4. Remove the brake disc.

NOTE: During installation, make sure that the brake caliper hose does not become twisted.

NOTE: Make sure the brake disc-to-hub mounting surface is free of rust and foreign material before applying anti-seize lubricant.

NOTE: Do not allow anti-seize to make contact with the wheel studs.

5. To install, reverse the removal procedure.
   - Using the specified brake cleaner, clean the mating surfaces.
   - Apply specified lubricant as shown.

Halfshaft support bracket bolts	55	41
Intermediate shaft bearing support bolts	40	30
Lower arm ball joints nuts	200	148
Lower control arm bolt and nut	103	76

DESCRIPTION AND OPERATION

FRONT DRIVE HALFSHAFTS

The halfshaft and intermediate shaft consist of the following components:

- Inner constant velocity (CV) joints
- Outer CV joints
- Interconnecting shafts

The halfshafts are splined on the outboard stub shaft to drive the wheel hubs. They are retained in the wheel hubs by special wheel hub nuts which also control the wheel bearing preload. The LH halfshaft is splined on the inboard stub shaft and is retained in the differential side gear in the transaxle by a circlip. The RH halfshaft has internal splines which are driven by the intermediate shaft. The intermediate shaft has a circlip on the outboard end and is retained inside the inboard stub shaft. The circlips must be installed new whenever they are removed. The intermediate shaft is retained in the transaxle differential side gear by bolts that go through the intermediate shaft support bearing. The intermediate shaft also goes through the power transfer unit (PTU) on all wheel drive (AWD) vehicles. The outer seal of the PTU must be installed new whenever the intermediate shaft is removed.

The front drive halfshaft CV joints consist of the following components:

- CV joint boot clamps
- Convoluted CV joint boots

- Tripod joint housings
- Ball and cage housings
- Special CV high temperature grease
- On the LH side, the inboard CV joint is retained in the differential side gear with a unique retainer circlip. Install a new circlip every time the halfshaft is disconnected.
- On the RH side, a unique driveshaft bearing retainer circlip retains the splined inboard CV joint to the intermediate shaft. Install a new circlip every time the halfshaft is disconnected from the intermediate shaft.
- A staked front axle wheel hub retainer secures the splined outboard CV joint to the wheel hub.
- Do not over angle the CV joints.
- Damage will occur to an assembled inboard CV joint if it is over plunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts from the front hub.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints.
- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.
- Do not remove the outer CV joint by pulling on the interconnecting shaft.
- Inspect all machined surfaces and splines for damage.

The CV joint mates the interconnecting shaft with the stub shaft. The joint allows for smooth rotation of the interconnecting shaft and the stub shafts. They also adjust for length variances and angle requirements as the vehicle goes through jounce and rebound.

The halfshaft joints are not repairable and are serviced as assemblies only.

DIAGNOSTIC TESTS

FRONT DRIVE HALFSHAFTS

Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

HALFSHAFT - RH

Special Tools

Illustration	Tool Name	Tool Number

 ST2646-A	Adapter for 204-592	204-592/1
 ST2138-A	Installer, Halfshaft	204-161 (T97P-1175-A)
 ST2272-A	Remover, Front Wheel Hub	205-D070 (D93P-1175-B) or equivalent
 ST2945-A	Separator, Ball Joint	204-592

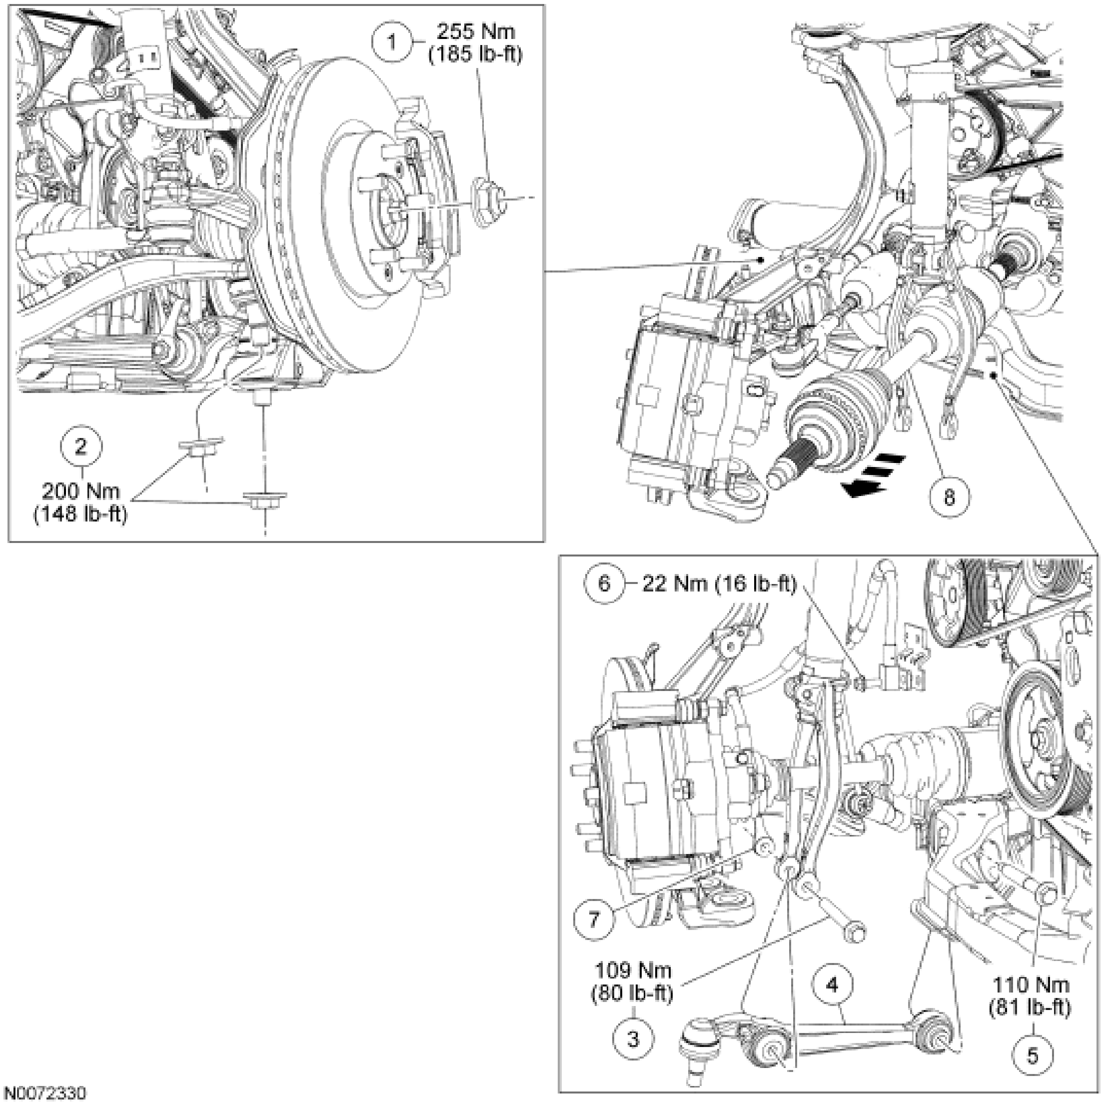

Fig. 1: Exploded View Of Halfshaft With Torque Specifications - RH
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3N405	Front wheel hub nut
2	3C499	Ball joint nuts (2 required)
3	W500550-S	Damper fork bolt
4	3A423	Front lower control arm
5	W712840-S	Front lower control arm inboard bolt
6	W505263-S	Brake tube bracket bolt
7	3C347	Damper fork bolt flag nut
8	3A427	Front halfshaft assembly

REMOVAL

1. Remove the front tire and wheel. For additional information, refer to **WHEELS AND TIRES** article.

NOTE: Apply the brake to keep the halfshaft from rotating.

2. Remove and discard the front wheel hub nut.

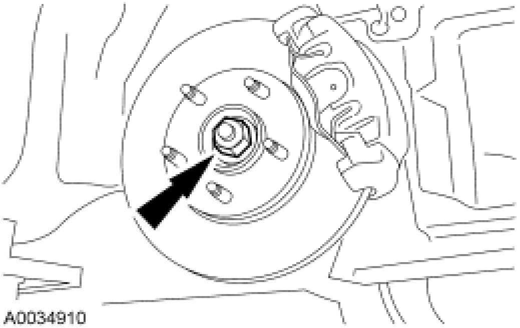

Fig. 2: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

3. Remove the front and rear lower control arm nuts.

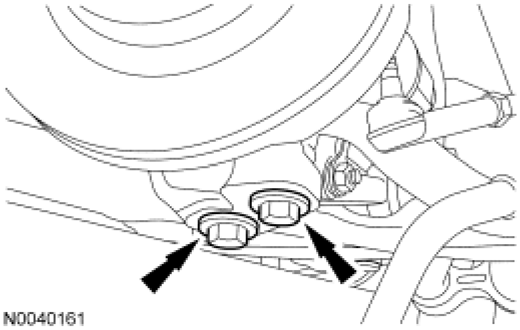

Fig. 3: Locating Front And Rear Lower Control Arm Nuts
Courtesy of FORD MOTOR CO.

NOTE: Once pressure is applied to the ball joint with the special tool, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

4. Using the special tools, disconnect the 2 lower ball joints.

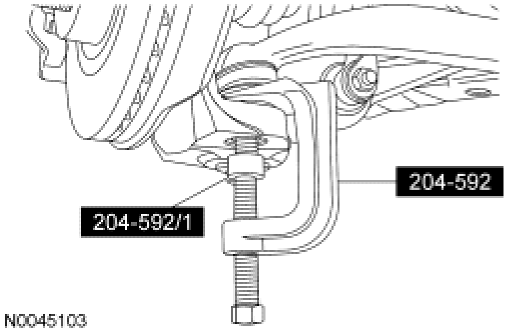

Fig. 4: Identifying Special Tools (204-592/1, 204-592)
Courtesy of FORD MOTOR CO.

5. Using the special tool, separate the halfshaft from the wheel hub.

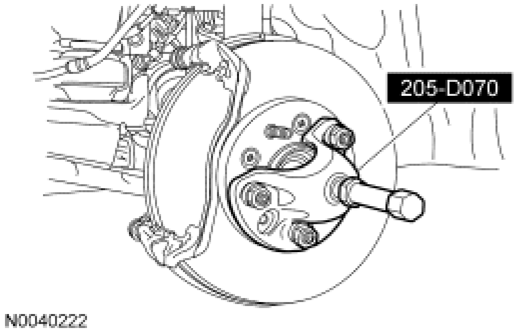

Fig. 5: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

CAUTION: When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.

6. Remove the damper fork bolt and flag nut connecting the damper fork to the lower control arm.

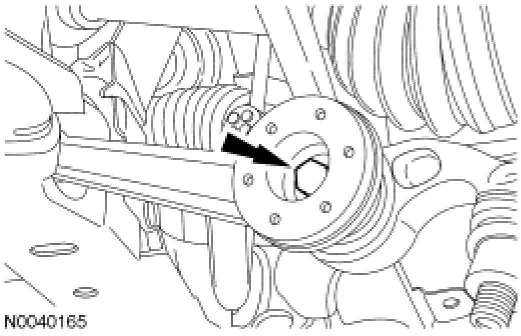

Fig. 6: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

7. Remove the brake caliper hose bolt.

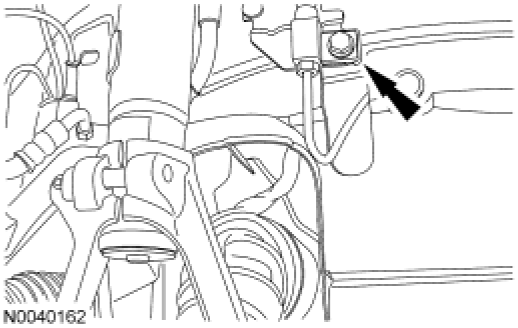

Fig. 7: Locating Brake Caliper Hose Bolt
Courtesy of FORD MOTOR CO.

NOTE: Support the knuckle with a suitable jackstand.

8. Pull the knuckle outboard and rotate it toward the rear of the vehicle.

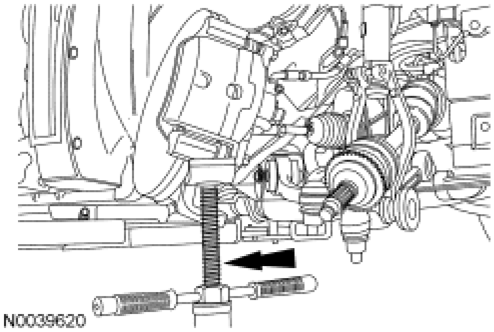

Fig. 8: Locating Jackstand
Courtesy of FORD MOTOR CO.

9. Remove the lower control arm-to-subframe bolt. Remove the lower control arm.

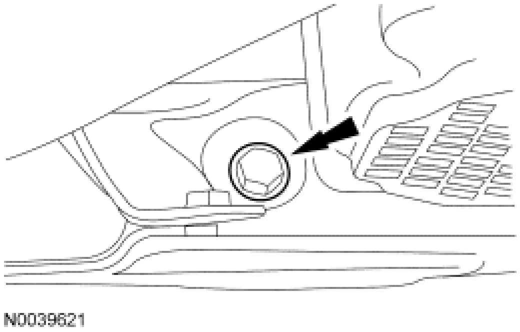

Fig. 9: Locating Lower Control Arm-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

10. Use a brass drift to strike the right side halfshaft in the indicated area and separate the RH halfshaft from the intermediate shaft.

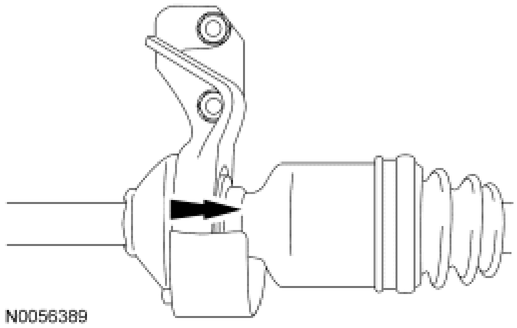

Fig. 10: Locating Brass Drift
Courtesy of FORD MOTOR CO.

11. Pull the strut forward, remove the halfshaft from the damper fork. Position the halfshaft in front of the damper fork towards the front of the vehicle and remove the halfshaft.

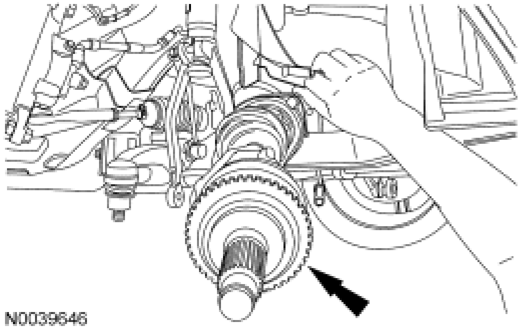

Fig. 11: Pulling Strut Forward & Removing Halfshaft From Damper Fork
Courtesy of FORD MOTOR CO.

12. Remove and discard the circlip from the intermediate shaft.

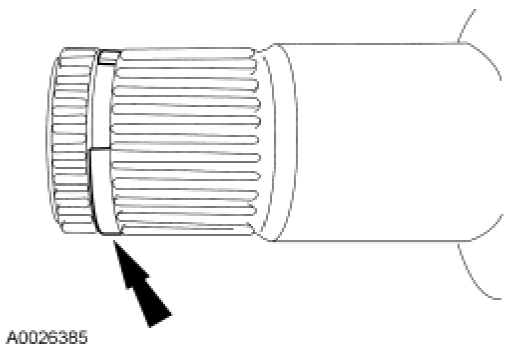

Fig. 12: Locating Halfshaft Circlip

Courtesy of FORD MOTOR CO.

INSTALLATION

CAUTION: Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft separation during vehicle operation.

1. Install a new intermediate shaft circlip.

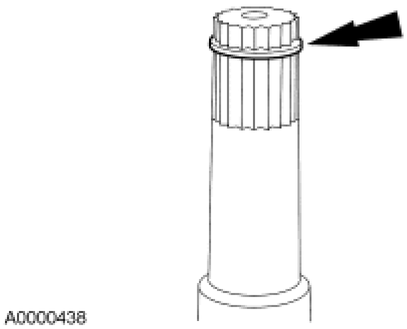

Fig. 13: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

NOTE: Pull the right side shaft outward to make sure the circlip is locked.

2. Align the splines on the right side shaft with the intermediate shaft and push the stub shaft in until the circlip locks the shafts together.
3. Insert the halfshaft into the wheel hub.
4. Rotate the knuckle into position.
5. Install the lower control arm to subframe and install the bolt.
   - Tighten to 103 Nm (76 lb-ft).

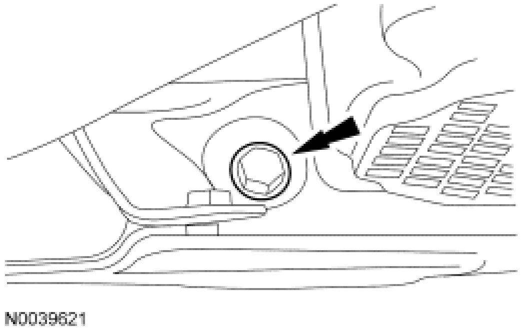

Fig. 14: Locating Lower Control Arm-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

6. Install the damper fork bolt and flag nut connecting the damper fork to the lower control arm.

- Tighten to 109 Nm (80 lb-ft).

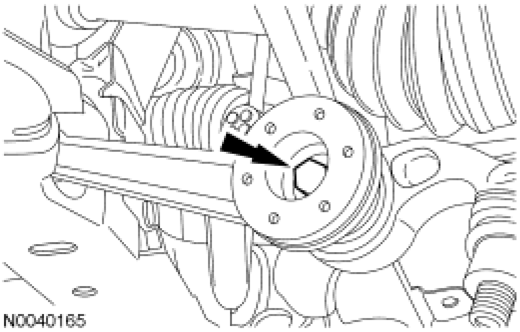

Fig. 15: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

7. Install the brake caliper hose bolt.
    - Tighten to 22 Nm (16 lb-ft).

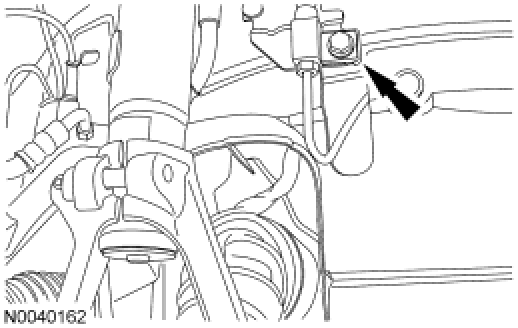

Fig. 16: Locating Brake Caliper Hose Bolt
Courtesy of FORD MOTOR CO.

8. Install the front and rear lower control arm nuts.
    - Tighten to 200 Nm (148 lb-ft).
9. Using the special tool, install the halfshaft in the wheel hub.

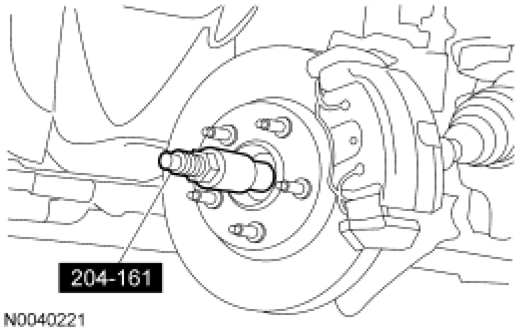

Fig. 17: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

CAUTION: Do not tighten the front wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

NOTE: Apply the brake to keep the halfshaft from rotating.

10. Install a new front wheel hub nut.
    - Tighten to 255 Nm (185 lb-ft).
11. Stake the new nut in line with the keyway to a recommended minimum depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

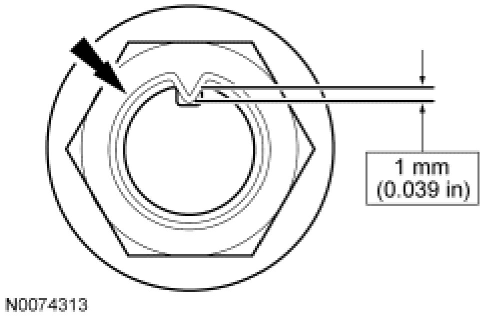

Fig. 18: Identifying Rear Wheel Hub Nut
Courtesy of FORD MOTOR CO.

12. Install the front tires and wheels. For additional information, refer to **WHEELS AND TIRES** article.

REMOVAL

1. Remove the front tire and wheel. For additional information, refer to **WHEELS AND TIRES** article.

NOTE: Apply the brake to keep the halfshaft from rotating.

2. Remove and discard the front wheel hub nut.

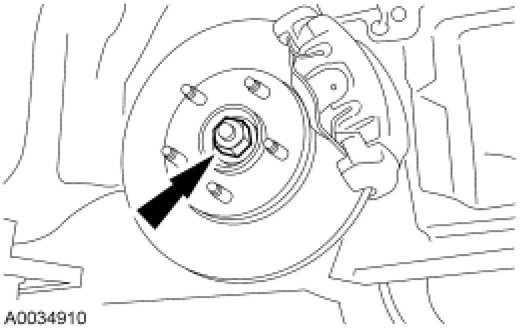

Fig. 20: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

3. Remove the front and rear lower control arm nuts.

NOTE: Once pressure is applied to the ball joint with the special tool, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

4. Using the special tool, disconnect the 2 lower ball joints.

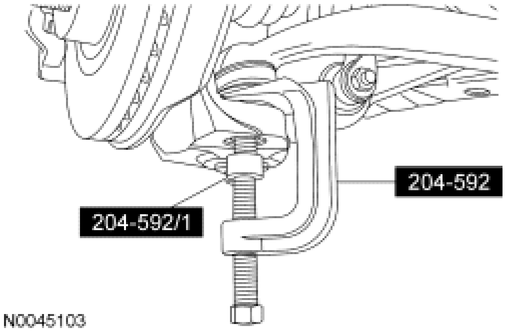

Fig. 21: Identifying Special Tools (204-592/1, 204-592)

Courtesy of FORD MOTOR CO.

5. Using the special tool, separate the halfshaft from the wheel hub.

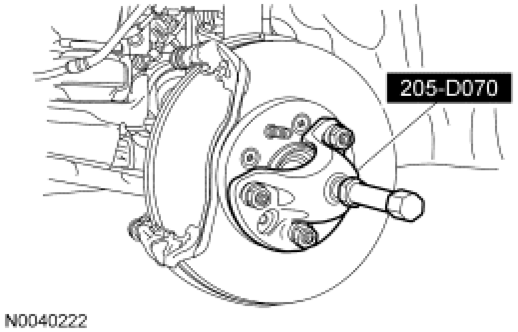

Fig. 22: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

CAUTION: When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.

6. Remove the damper fork bolt and flag nut connecting the damper fork to the lower control arm.

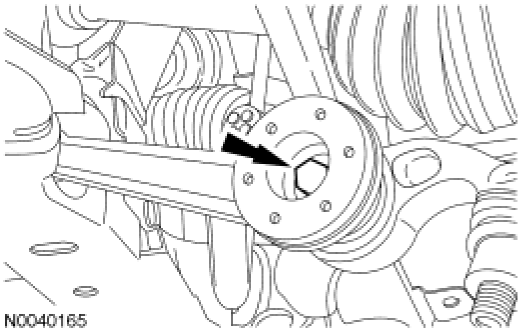

Fig. 23: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

7. Remove the brake caliper hose bolt.

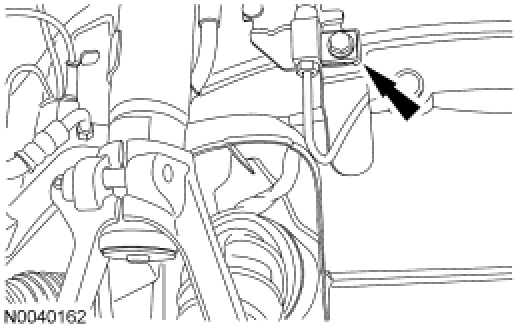

Fig. 24: Locating Brake Caliper Hose Bolt
Courtesy of FORD MOTOR CO.

NOTE: Support the knuckle with a suitable jackstand.

8. Pull the knuckle outboard and rotate it toward the rear of the vehicle.

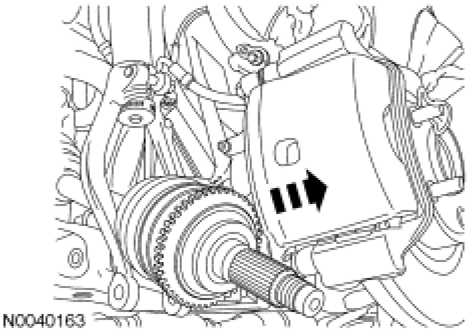

Fig. 25: Pulling Knuckle Outboard
Courtesy of FORD MOTOR CO.

9. Remove the lower control arm-to-subframe bolt. Remove the lower control arm.

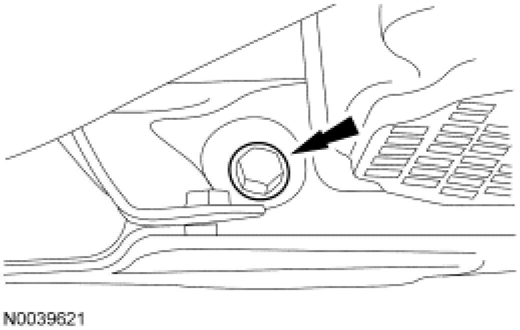

Fig. 26: Locating Lower Control Arm-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

10. Remove the 4 pushpins and position the splash shield aside.

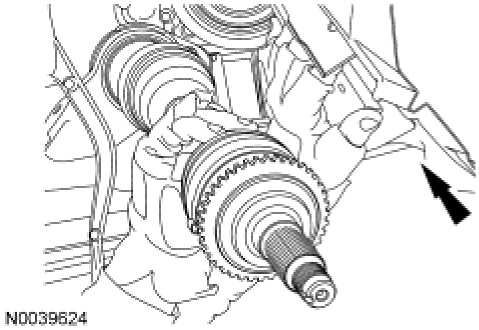

Fig. 27: Locating Pushpins
Courtesy of FORD MOTOR CO.

CAUTION: The sharp edges on the stub shaft splines can slice or puncture the oil seal. Use care when inserting the stub shaft into the transmission.

11. Using the special tools, remove the halfshaft from the transmission.

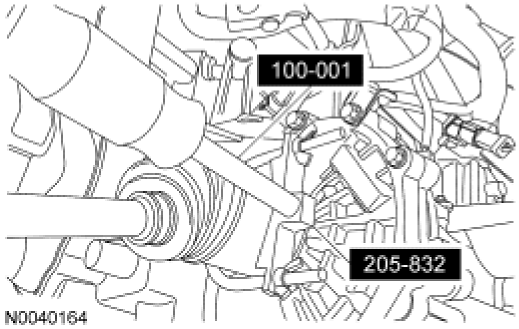

Fig. 28: Identifying Special Tools (100-001, 205-832)
Courtesy of FORD MOTOR CO.

12. Remove and discard the circlip from the stub shaft.

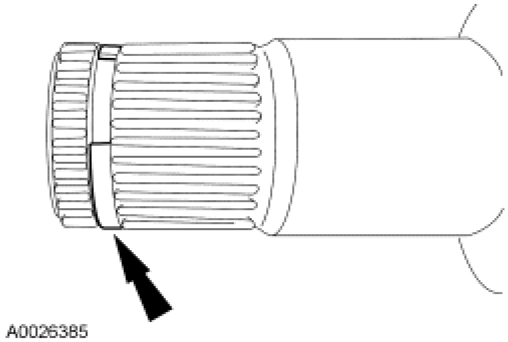

Fig. 29: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

CAUTION: Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft separation during vehicle operation.

1. Install a new stub shaft circlip.

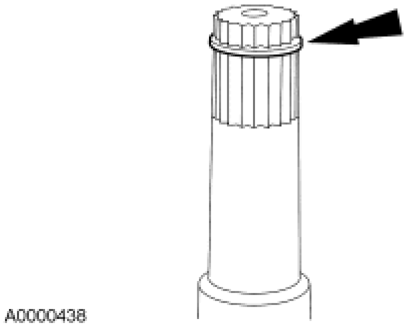

Fig. 30: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

2. Insert the halfshaft into the wheel hub.

NOTE: After insertion, pull the halfshaft inner end to make sure the circlip is locked.

3. Push the stub shaft into the transmission so the circlip locks into the differential side gear.
4. Install the splash shield and pushpins.
5. Rotate the knuckle into position.
6. Install the lower control arm bolt and nut to the subframe.
   - Tighten to 103 Nm (76 lb-ft).

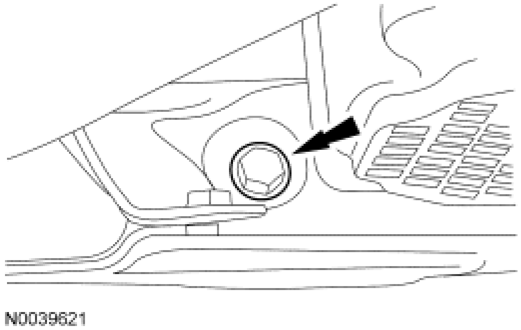

Fig. 31: Locating Lower Control Arm-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

7. Install the damper fork bolt connecting the damper fork to the lower control arm.
   - Tighten to 109 Nm (80 lb-ft).

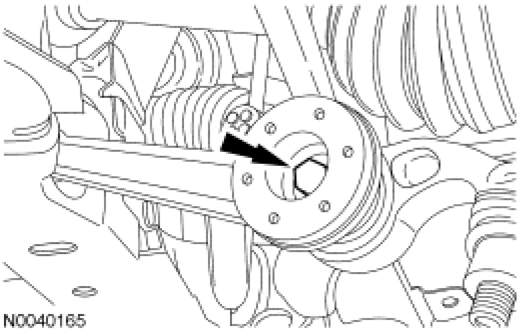

Fig. 32: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

8. Install the brake caliper hose bolt.
   - Tighten to 22 Nm (16 lb-ft).

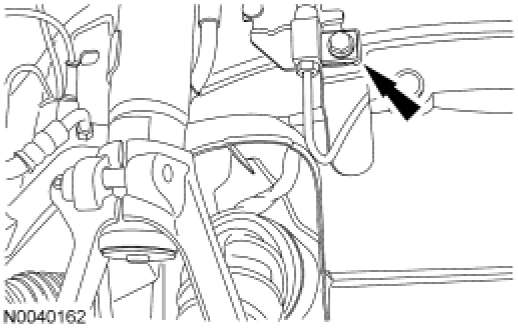

Fig. 33: Locating Brake Caliper Hose Bolt
Courtesy of FORD MOTOR CO.

9. Using the special tool, install the halfshaft in the wheel hub.

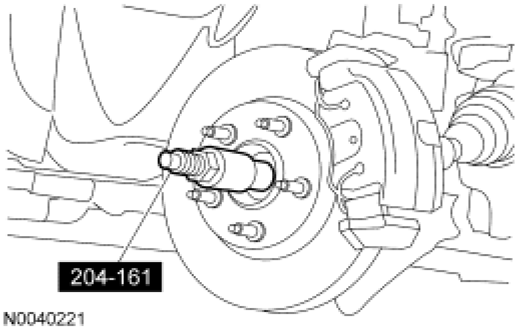

Fig. 34: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

10. Install the front and rear lower control arm nuts.
    - Tighten to 200 Nm (148 lb-ft).

CAUTION: Do not tighten the front wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

NOTE: Apply the brake to keep the halfshaft from rotating.

11. Install the new front wheel hub nut.
    - Tighten to 255 Nm (185 lb-ft).

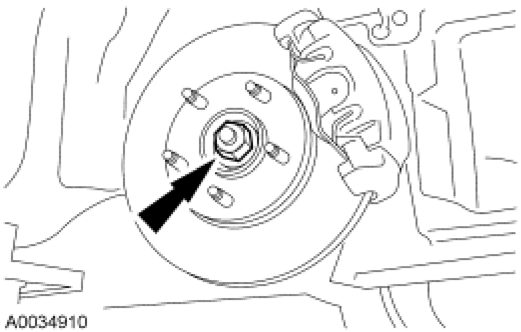

Fig. 35: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

12. Stake the new nut in line with the keyway to a recommended minimum depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

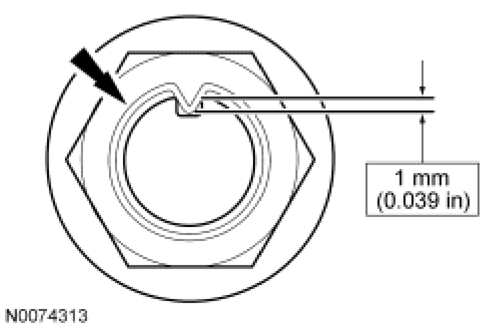

Fig. 36: Identifying Rear Wheel Hub Nut
Courtesy of FORD MOTOR CO.

13. Install the front tire and wheel. For additional information, refer to **WHEELS AND TIRES** article.

Courtesy of FORD MOTOR CO.

3.5L vehicles

3. Remove the 2 catalytic converter bracket bolts.

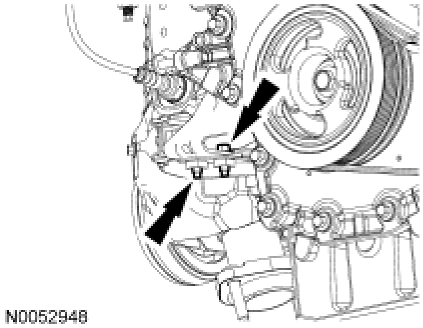

Fig. 39: Identifying Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

4. Remove the 2 nuts and remove the catalytic converter support bracket.

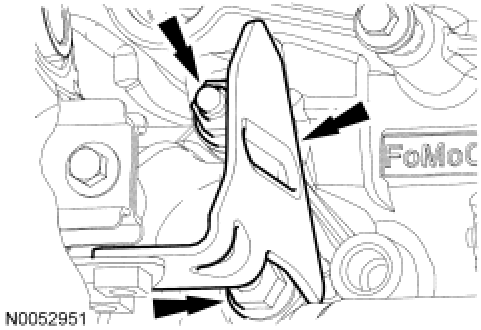

Fig. 40: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

5. Remove the 3 bolts from the intermediate shaft bearing support bracket.

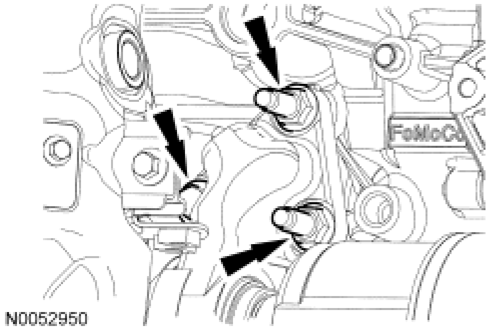

Fig. 41: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: Do not damage the transaxle seals when removing the intermediate shaft.

6. Carefully remove the intermediate shaft while supporting both ends of the intermediate shaft.

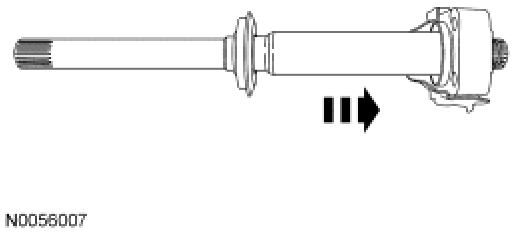

Fig. 42: Removing Intermediate Shaft While Supporting Both Ends Of Intermediate Shaft
Courtesy of FORD MOTOR CO.

7. Remove and discard the circlip from the outboard end of the intermediate shaft.

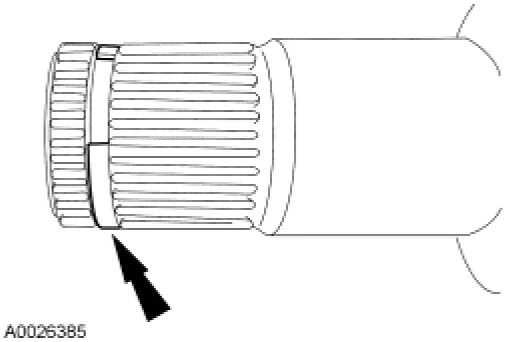

Fig. 43: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

All vehicles

CAUTION: Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft separation during vehicle operation.

1. Install as new circlip on the outboard end of the intermediate shaft.

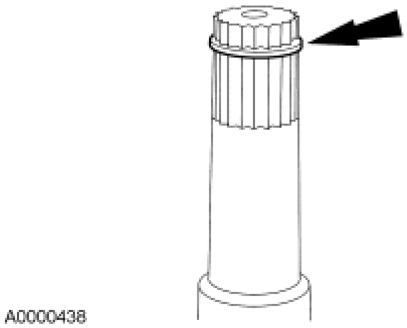

Fig. 44: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

2. Position the intermediate shaft in the transaxle and engage the intermediate shaft splines with the transaxle side gears. Make sure the circlip is locked in the gear.

3.0L vehicles

3. Install the 2 intermediate shaft support bracket bolts.
   - Tighten to 40 Nm (30 lb-ft).

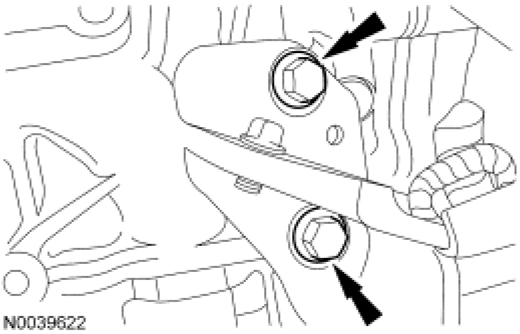

Fig. 45: Locating RH Halfshaft Carrier Bearing Bracket Bolts
Courtesy of FORD MOTOR CO.

3.5L vehicles

4. Install the 3 intermediate shaft bearing support bracket bolts.
   - Tighten to 40 Nm (30 lb-ft).

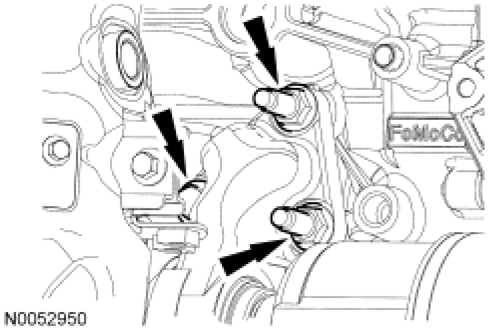

Fig. 46: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

5. Install the catalytic converter support bracket and the 2 nuts.
   - Tighten to 23 Nm (17 lb-ft).

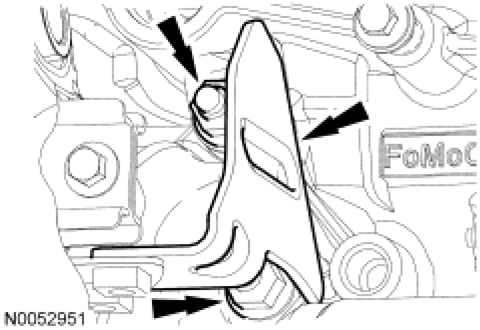

Fig. 47: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

6. Install the 2 catalytic converter bracket bolts.
   - Tighten to 20 Nm (15 lb-ft).

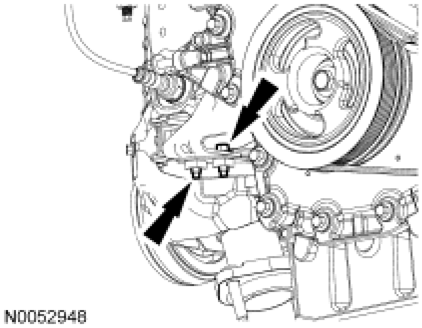

Fig. 48: Identifying Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

All vehicles

7. Install the RH halfshaft. For additional information, refer to **Halfshaft - RH** in this article.

INTERMEDIATE SHAFT - ALL WHEEL DRIVE (AWD)

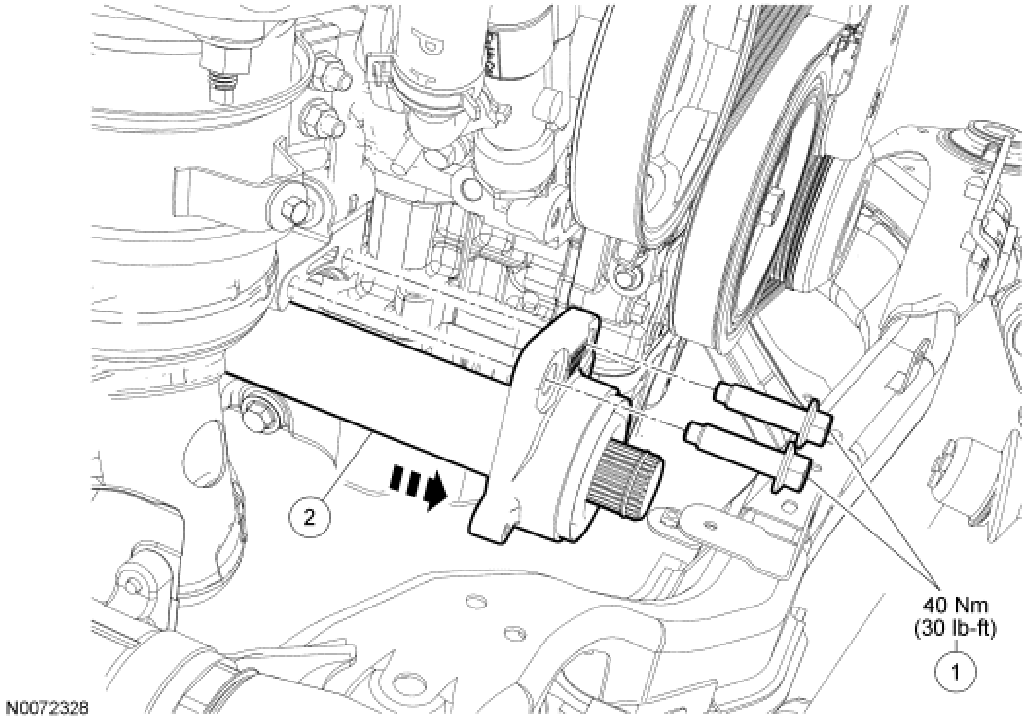

Fig. 49: Exploded View Of Intermediate Shaft With Torque Specification - All Wheel Drive (AWD)

Item	Part Number	Description
1	W500235-S	Halfshaft bearing support bolts (2 required)
2	3K183	Intermediate shaft assembly

REMOVAL

CAUTION: A new intermediate shaft seal in the power transfer unit (PTU) must be installed whenever the intermediate shaft is removed or leaks from the seal may occur. For additional information, refer to TRANSFER CASE - POWER TRANSFER UNIT (PTU) article.

1. Remove the RH halfshaft. For additional information, refer to **Halfshaft - RH** in this article.
2. Remove the 2 bolts from the intermediate shaft support bearing bracket.

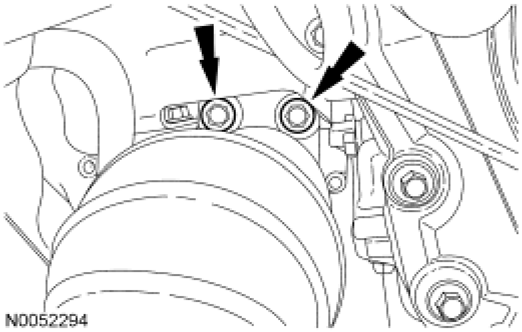

Fig. 50: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

NOTE: Do not damage the transaxle seals when removing the intermediate shaft.

3. Carefully remove the intermediate shaft while supporting both ends of the intermediate shaft.

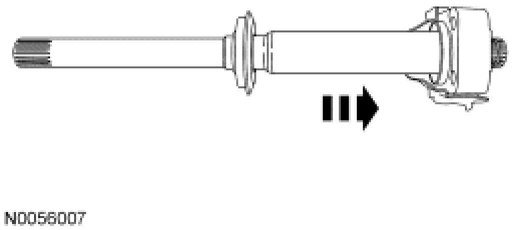

Fig. 51: Removing Intermediate Shaft While Supporting Both Ends Of Intermediate Shaft
Courtesy of FORD MOTOR CO.

4. Remove and discard the circlip from the outboard end of the intermediate shaft.

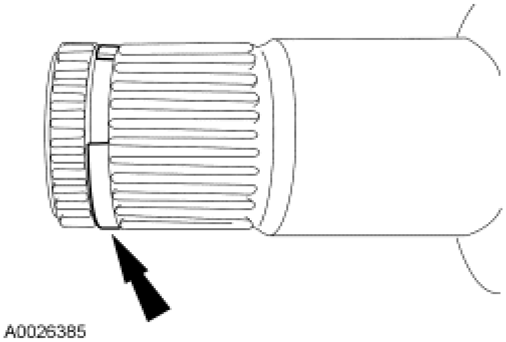

Fig. 52: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

CAUTION: Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft separation during vehicle operation.

1. Install a new circlip on the outboard end of the intermediate shaft.

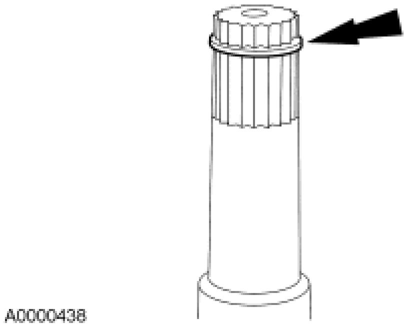

Fig. 53: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

2. Install a new intermediate shaft seal. For additional information, refer to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.
3. Position the intermediate shaft in the transaxle and engage the intermediate shaft splines with the transaxle side gears. Make sure the circlip is locked in the gear.
4. Install the 2 intermediate shaft support bracket bolts.
    - Tighten to 40 Nm (30 lb-ft).
5. Install the RH halfshaft. For additional information, refer to **Halfshaft - RH** in this article.

FENDER

REMOVAL AND INSTALLATION

All vehicles

1. Remove the front fender splash shield. For additional information, refer to **Fender Splash Shield**.
2. Remove the insulator panel.

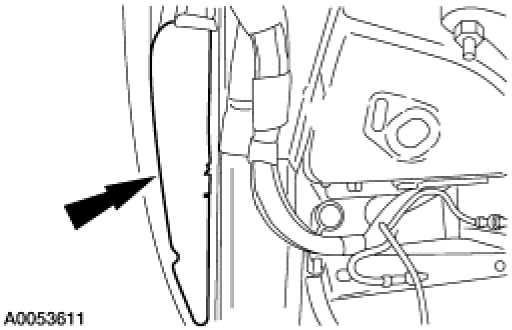

Fig. 2: Locating Insulator Panel
Courtesy of FORD MOTOR CO.

3. Remove the inner fender nut.
   - To install, tighten to 9 N.m (80 lb-in).
4. Remove the 2 lower fender bolts.
   - To install, tighten to 9 N.m (80 lb-in).

Fusion and Milan only

5. Remove the side turn signal lamp. For additional information, refer to **EXTERIOR LIGHTING** article.

All vehicles

NOTE: The front door must be open to gain access to the rear fender bolts.

6. Remove the upper rear fender bolt.
   - To install, tighten to 9 N.m (80 lb-in).

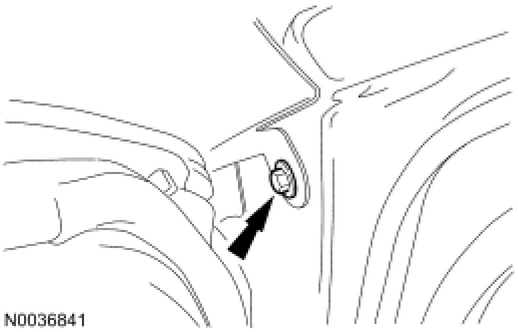

Fig. 3: Locating Upper Rear Fender Bolt
Courtesy of FORD MOTOR CO.

7. Remove the fascia bracket from the front fender.
    1. Remove the screw.
    2. Remove the bolt.
    3. Disconnect the clip from the fender.

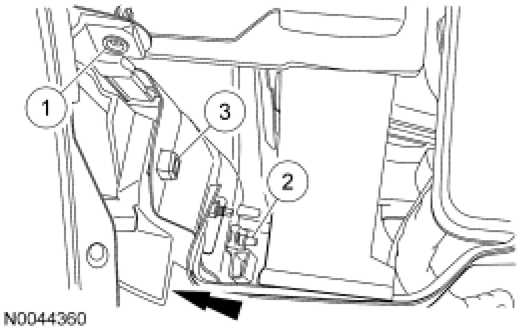

Fig. 4: Removing Fascia Bracket From Front Fender
Courtesy of FORD MOTOR CO.

NOTE: Two bolts required for Fusion and Milan, one bolt required for MKZ.

8. Remove the front support brace fender bolts.
    - To install, tighten to 9 N.m (80 lb-in).

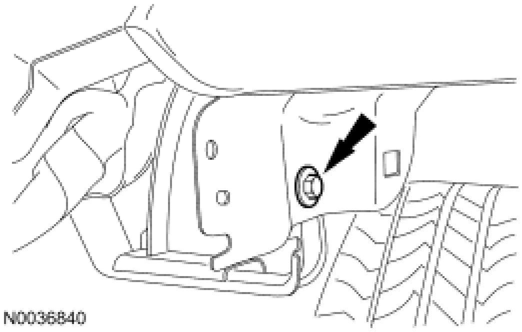

Fig. 5: Locating Front Support Brace Fender Bolts
Courtesy of FORD MOTOR CO.

9. Remove the push pin from the front fender to headlamp.
10. Remove the upper rear inner fender bolt.
    - To install, tighten to 5 N.m (44 lb-in).

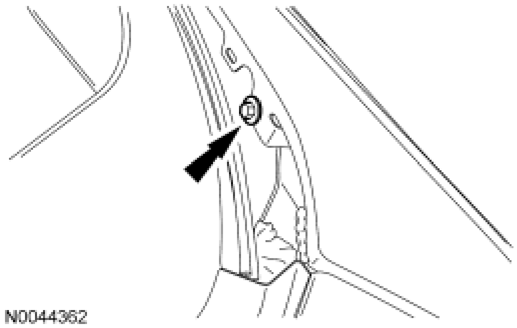

Fig. 6: Locating Upper Rear Inner Fender Bolt
Courtesy of FORD MOTOR CO.

11. Remove the 3 upper fender bolts and the front fender.
    - To install, tighten to 9 N.m (80 lb-in).
12. To install, reverse the removal procedure.

FENDER SPLASH SHIELD

REMOVAL AND INSTALLATION

1. Remove the fender splash shield screws.
2. Remove the 11 fender splash shield pin-type retainers.
3. Remove the fender splash shield.
4. To install, reverse the removal procedure.

COWL PANEL GRILLE

DESCRIPTION AND OPERATION

FRONT SUSPENSION

The front suspension consists of the following components:

- Wheel bearings
- Wheel hubs
- Wheel studs
- Front and rear lower arms
- Upper arms
- Stabilizer bar
- Stabilizer bar bushings
- Stabilizer bar links
- Shock and spring assemblies
- Wheel knuckles

The front suspension is an independent suspension design. This front suspension uses 3 parallel arms (one upper arm and 2 lower arms). Each arm has a mounting position to the chassis and a ball joint attachment at the wheel knuckle. The shock absorber mounts to the lower arm and along with the spring, controls vertical movement. A stabilizer bar and links are included to control suspension lean/sway during turns. The multiple arm design allows for carefully controlled motion of the wheel throughout suspension travel, controlling such parameters as camber angle, caster angle and toe.

DIAGNOSTIC TESTS

FRONT SUSPENSION

Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

WHEEL BEARING AND WHEEL HUB

Special Tools

Illustration	Tool Name	Tool Number

Item	Part Number	Description
1	1104	Wheel hub
2	3B625	Snap ring
3	1215	Wheel bearing
4	2K005 LH/ 2K004 RH	Disc brake shield
5	3K171 LH/ 3K170 RH	Wheel knuckle

REMOVAL

NOTE: If removing the wheel hub, a new wheel bearing must be installed.

1. Remove the wheel knuckle. For additional information, refer to **Wheel Knuckle**.
2. Using the Step Plate, press the wheel hub from the wheel bearing.

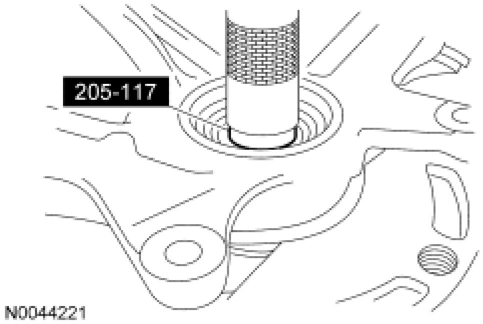

Fig. 2: Pressing Wheel Hub From Wheel Bearing Using Special Tool (205-117)
Courtesy of FORD MOTOR CO.

NOTE: **This step may not be necessary if the inner wheel bearing race remains on the wheel hub after removing the wheel hub.**

3. If necessary, using the Pinion Bearing Cone Remover, press the inner wheel bearing race from the wheel hub.

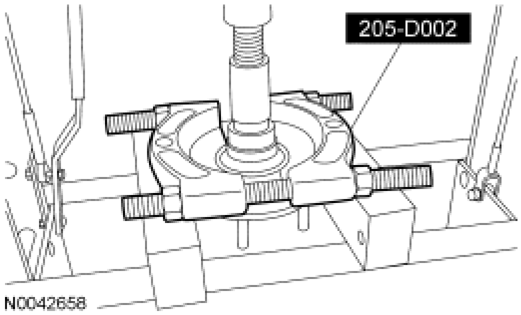

Fig. 3: Pressing Inner Wheel Bearing Race From Wheel Hub Using Special Tool (205-D002)
Courtesy of FORD MOTOR CO.

4. Remove the snap ring.
5. Using the Wheel Hub Cup Remover/Installer, press the wheel bearing from the wheel knuckle.

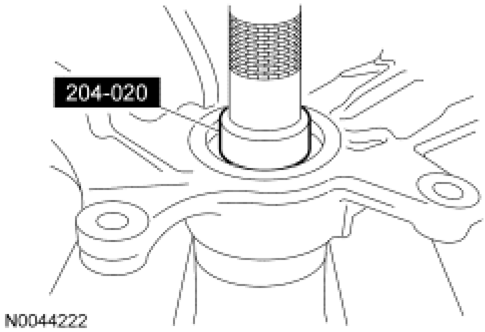

Fig. 4: Pressing Outer Wheel Bearing Race From Wheel Knuckle Using Special Tool (204-020)
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Using the Wheel Hub Bearing Cup Installer, press the wheel bearing into the wheel knuckle.

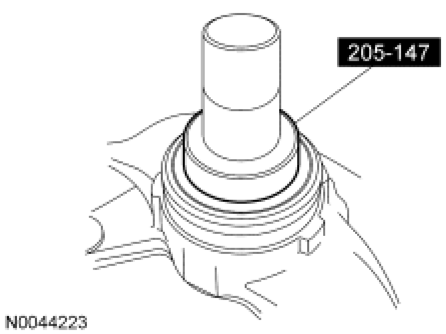

Fig. 5: Pressing Wheel Bearing Into Wheel Knuckle Using Special Tool (205-147)
Courtesy of FORD MOTOR CO.

2. Install the snap ring.
3. Using the Step Plate and Wheel Hub Bearing Cup Installer, press the wheel hub into the wheel bearing.

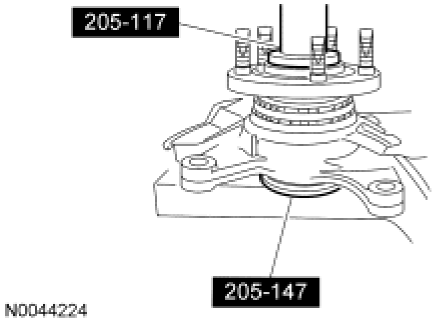

Fig. 6: Pressing Wheel Hub Into Wheel Bearing Using Special Tools (205-117) & (205-147)
Courtesy of FORD MOTOR CO.

4. Install the wheel knuckle. For additional information, refer to **Wheel Knuckle**.

WHEEL STUDS

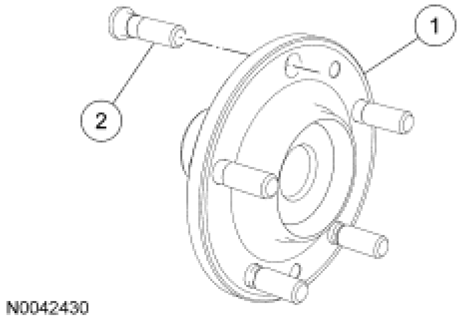

Fig. 7: Exploded View Of Wheel Studs
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1104	Wheel hub
2	1107	Wheel stud

REMOVAL

1. Remove the wheel hub. For additional information, refer to **Wheel Bearing and Wheel Hub**.
2. Using a press, remove the wheel stud from the wheel bearing and hub assembly.

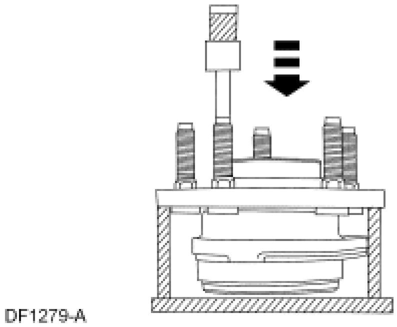

Fig. 8: Identifying Wheel Stud From Wheel Bearing & Hub Assembly
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.
2. Using a press, install a new wheel stud.

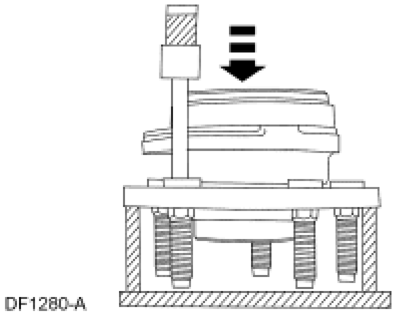

Fig. 9: Installing New Wheel Stud Using A Press
Courtesy of FORD MOTOR CO.

3. Install the wheel hub. For additional information, refer to **Wheel Bearing and Wheel Hub**.

LOWER ARM - FRONT

Special Tools

Illustration	Tool Name	Tool Number
	Adapter for 204-592	204-592/1
	Separator, Ball Joint	204-592

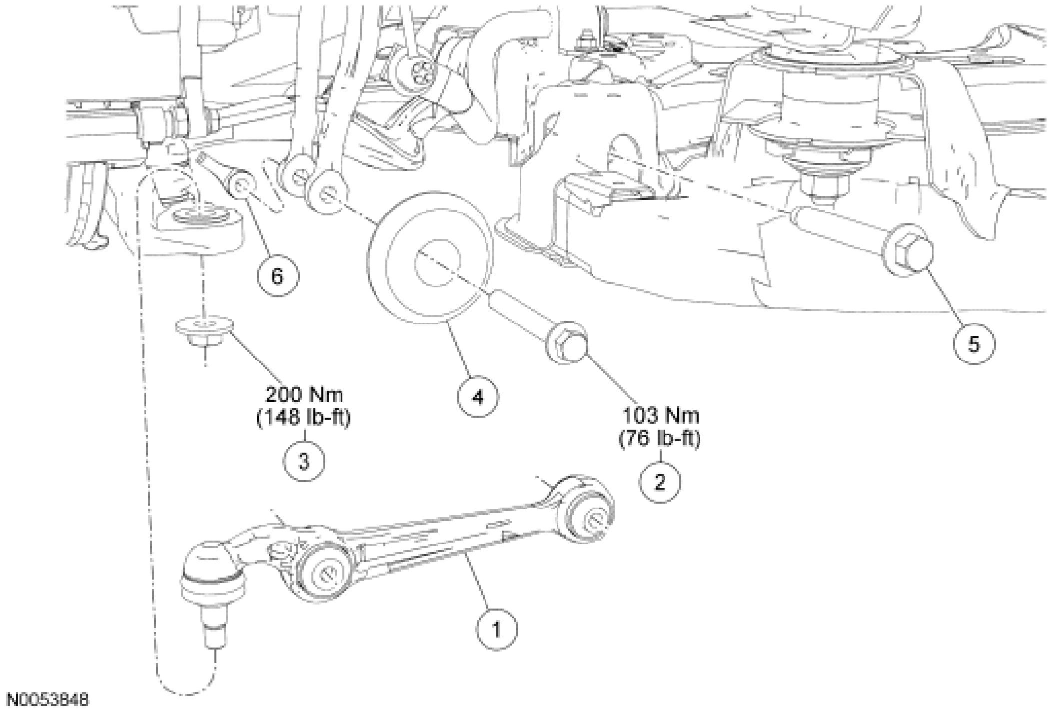

Fig. 10: Exploded View Of Front Lower Arm With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3A423	Lower arm (front)
2	W500550	Damper fork-to-lower arm bolt
3	3C499	Lower ball joint nut (front)
4	3C156	Damper
5	W712840	Front lower arm-to-subframe bolt
6	3C347	Damper fork-to-lower arm flag nut

REMOVAL AND INSTALLATION

NOTE: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Using a suitable jack, support the front wheel knuckle at the rear lower ball joint.
3. Remove the front lower arm-to-subframe bolt.
   - Discard the bolt.

- To install, tighten the new bolt to 110 Nm (81 lb-ft), then tighten an additional 90 degrees with the suspension at the bushing fastener tightening position.

4. Remove the damper fork-to-lower arm bolt flag nut and damper.
   - Discard the bolt and flag nut.
   - To install, tighten the new bolt and flag nut to 103 Nm (76 lb-ft) with the suspension at the bushing fastener tightening position.
5. Remove and discard the front lower ball joint nut.
   - To install, tighten the new nut to 200 Nm (148 lb-ft).

NOTE: When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.

NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

6. Using the Ball Joint Separator and Adapter, separate the front lower ball joint from the wheel knuckle and remove the front lower arm.

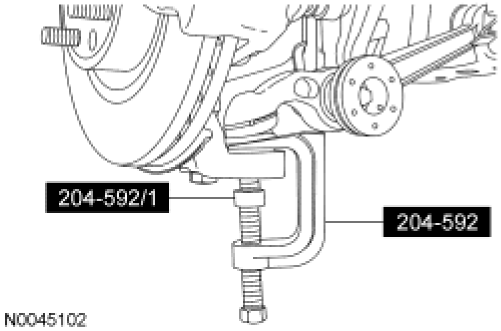

Fig. 11: Identifying Special Tool 204-592/1 And 204-592
Courtesy of FORD MOTOR CO.

NOTE: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.

7. To install, reverse the removal procedure.

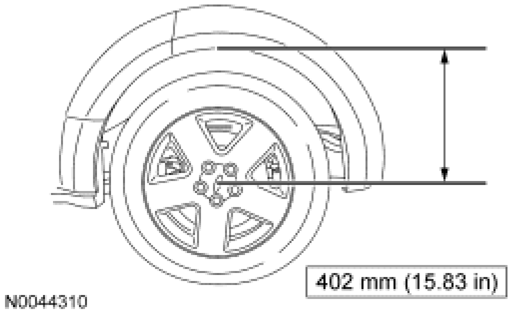

Fig. 12: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

LOWER ARM - REAR

Special Tools

Illustration	Tool Name	Tool Number
	Adapter for 204-592	204-592/1
	Separator, Ball Joint	204-592

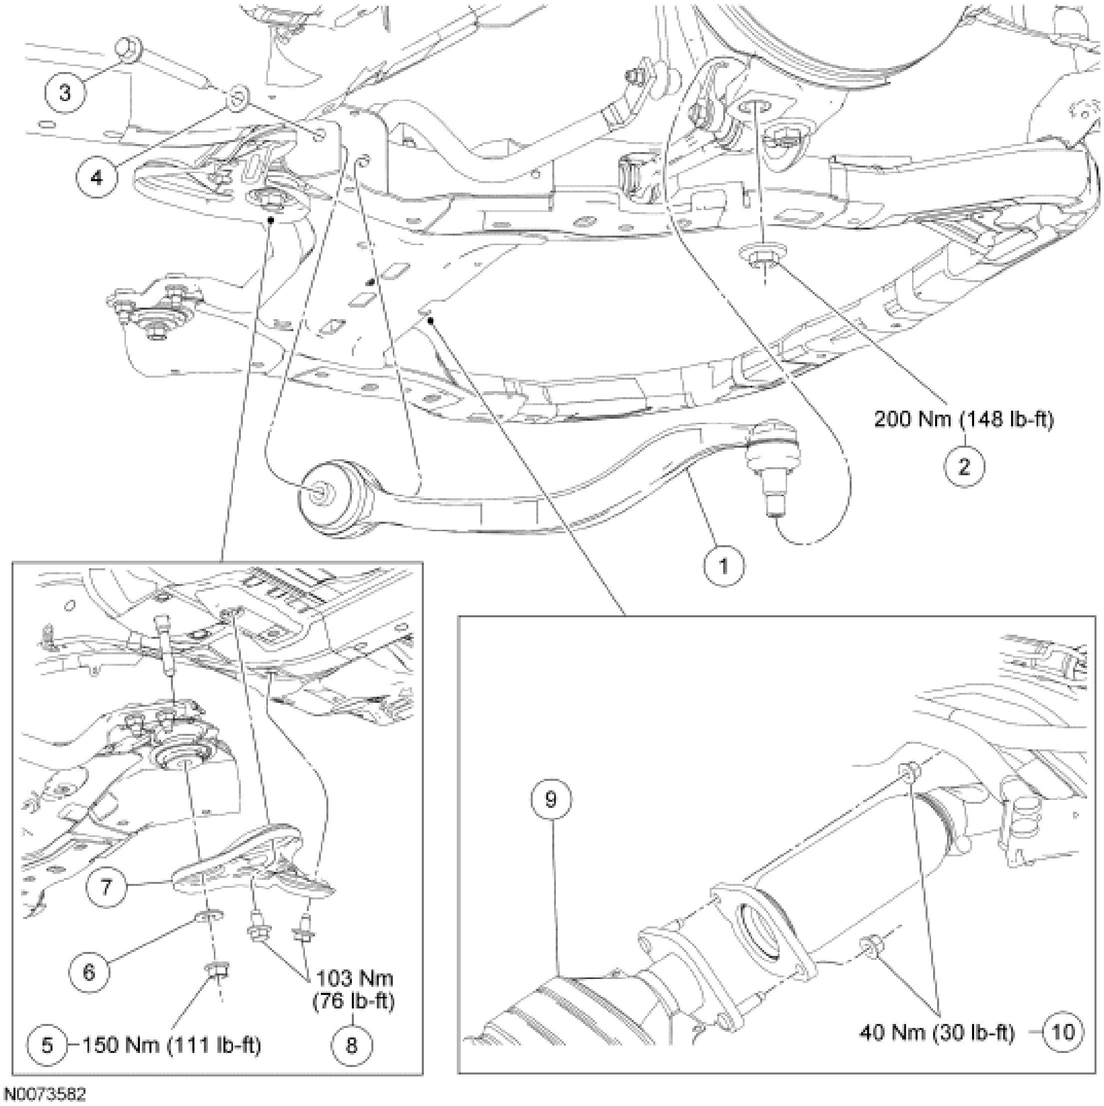

Fig. 13: Exploded View Of Rear Lower Arm With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3079 LH/ 3078 RH	Lower arm (rear)
2	3C499	Lower ball joint nut (rear)
3	W500752	Rear lower arm-to-subframe bolt
4	999581222	Washer
5	W520416	Subframe bracket-to-subframe nut (2 required)
6	5A552	Subframe bracket-to-subframe washer (2 required)
7	3B155 LH/ 3B154 RH	Subframe bracket (2 required)
8	3C496	Subframe bracket-to-body bolts (4

		required)
9	5E212	Catalytic converter
10	W705443	Catalytic converter manifold-to-exhaust flexible pipe nuts (2 required)

REMOVAL AND INSTALLATION

NOTE: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
2. Remove the 2 lower steering column shaft joint cover bolts and cover.

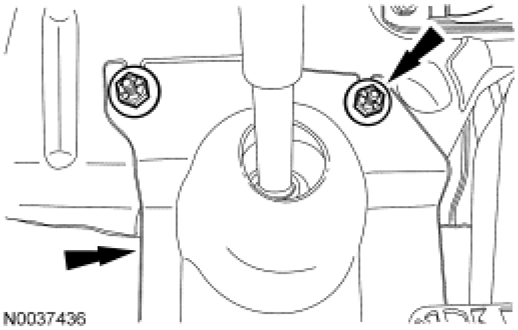

Fig. 14: Locating Steering Joint Cover And Nuts
Courtesy of FORD MOTOR CO.

NOTE: Do not allow the steering column shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE: Index-mark the steering column shaft position to the steering gear for reference during installation.

3. Remove the bolt and disconnect the steering column shaft from the steering gear.
   - Discard the bolt.
   - To install, align the index marks and tighten the new bolt to 25 Nm (18 lb-ft).

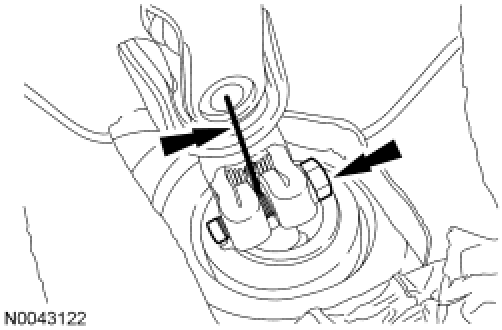

Fig. 15: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**Remove the steering column shaft-to-dash seal or damage to the seal can occur.**

NOTE:	**Make sure that the dash seal is correctly installed on the steering gear and the retaining clips are fully engaged into the body or damage to the steering gear can result.**

4. Remove the steering column shaft-to-dash seal.

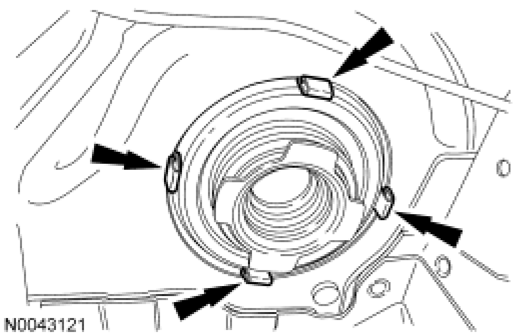

Fig. 16: Locating Steering Column Shaft-To-Dash Seal
Courtesy of FORD MOTOR CO.

5. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
6. Remove the 8 screws and position the LH and RH splash shields aside.

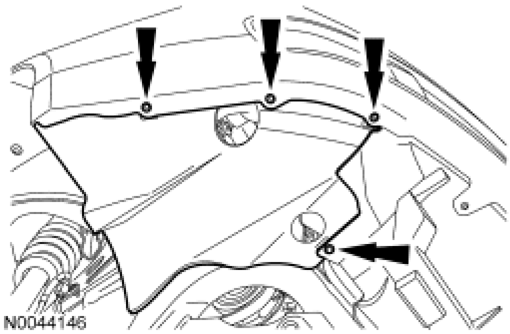

Fig. 17: Locating Screws And Position LH And RH Splash Shields Aside
Courtesy of FORD MOTOR CO.

7. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

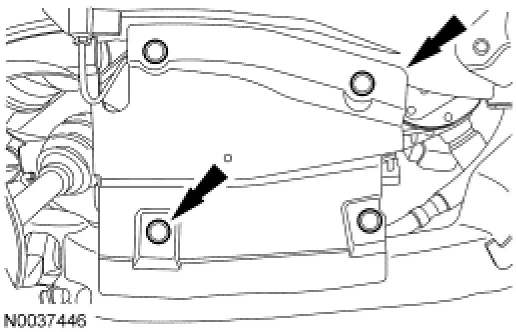

Fig. 18: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

8. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

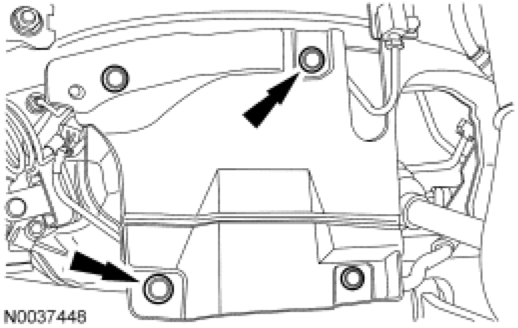

Fig. 19: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

9. If equipped, remove the bolts and the underbody cover shield.
   - To install, tighten 7 Nm (62 lb-in).
10. Remove and discard the 2 catalytic converter manifold-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.

- To install, tighten the new nuts to 40 Nm (30 lb-ft).

11. Using 2 suitable jack stands, support the rear of the subframe assembly.
12. Remove and discard the 4 subframe bracket-to-body bolts, the 2 subframe bracket-to-subframe nuts and washers. Lower the rear of the subframe.
    - To install, tighten the new bolts to 103 Nm (76 lb-ft).
    - To install, tighten the new nuts to 150 Nm (111 lb-ft).
13. Remove and discard the rear lower ball joint nut.
    - To install, tighten the new nut to 200 Nm (148 lb-ft).

NOTE: When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.

NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

14. Using the Ball Joint Separator and Adapter, separate the rear lower ball joint from the wheel knuckle.

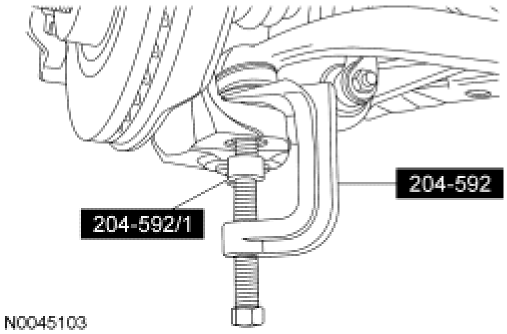

Fig. 20: Identifying Special Tools (204-592/1, 204-592)
Courtesy of FORD MOTOR CO.

15. Remove the rear lower arm-to-subframe bolt and washer and remove the rear lower arm.
    - Discard the bolt and washer.
    - To install, tighten the new bolt to 65 Nm (48 lb-ft), then tighten an additional 90 degrees.

NOTE: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.

16. To install, reverse the removal procedure.

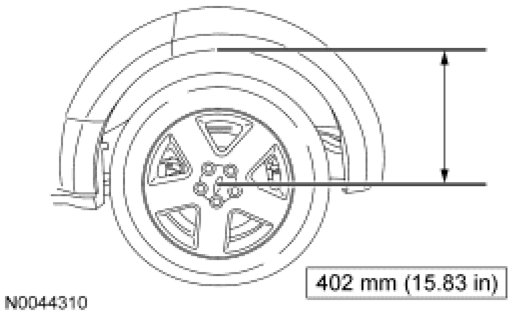

Fig. 21: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

UPPER ARM

Special Tools

Illustration	Tool Name	Tool Number
	Remover, Steering Arm	211-003 (T64P-3590-F)

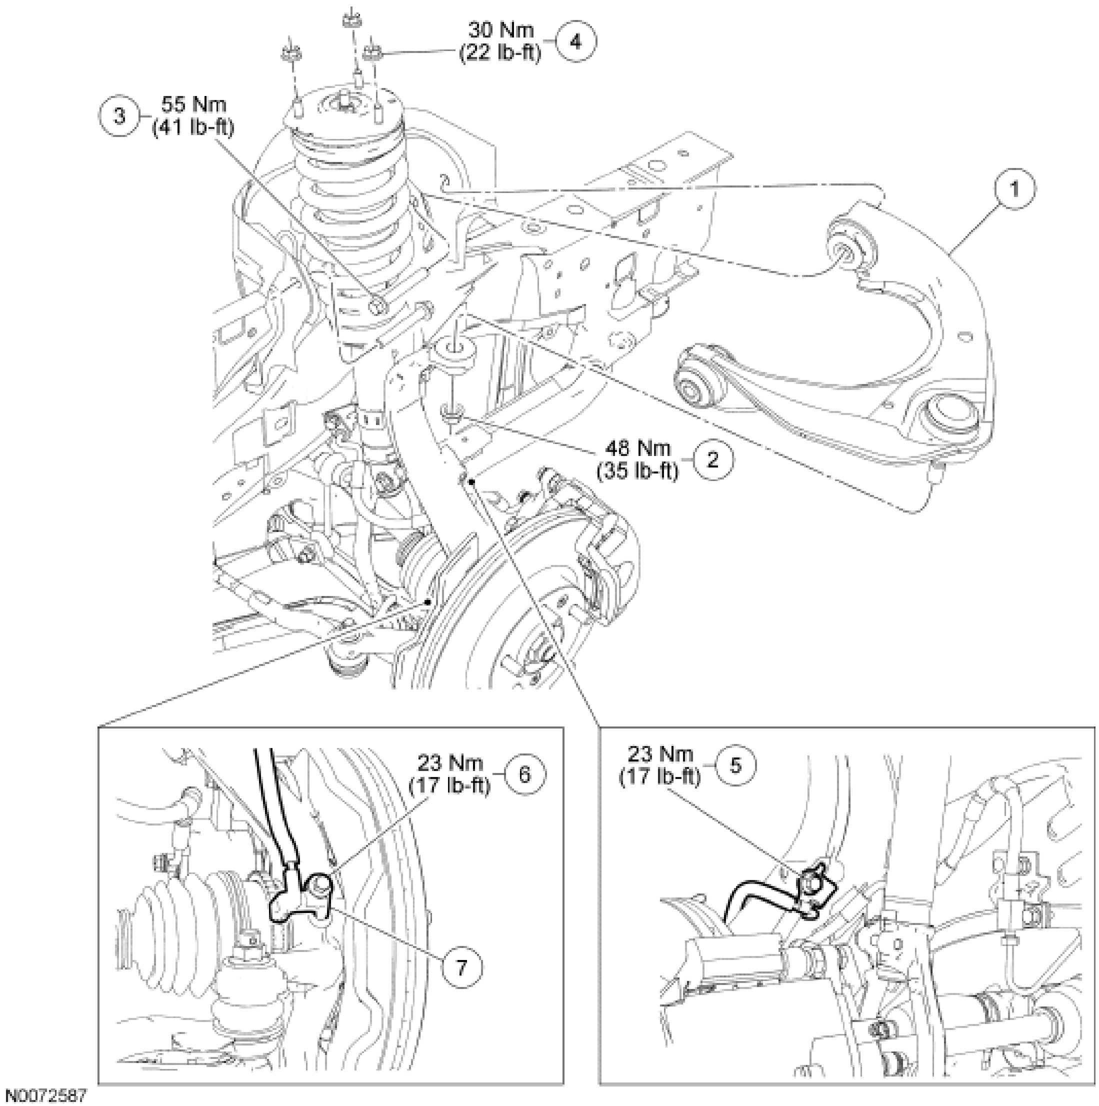

Fig. 22: Exploded View Of Upper Arm With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3091 LH/ 3084 RH	Upper arm
2	3C498	Upper ball joint nut
3	W500525	Upper arm-to-body bolt (2 required)
4	5B800	Shock absorber upper mount nut (3 required)
5	W500020	Wheel speed sensor harness bolt
6	W500222	Wheel speed sensor bolt
7	2C204 RH/ 2C205 LH	Wheel speed sensor

REMOVAL

NOTE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove and discard the 3 shock absorber upper mount nuts.
2. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
3. If equipped, remove the wheel speed sensor bolt.

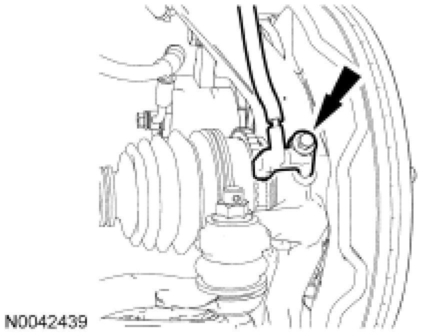

Fig. 23: Identifying Wheel Speed Sensor Bolt
Courtesy of FORD MOTOR CO.

4. If equipped, remove the wheel speed sensor harness bolt and position the wheel speed sensor aside.
5. Remove and discard the upper ball joint nut.
6. Using the Steering Arm Remover, separate the upper ball joint from the wheel knuckle.

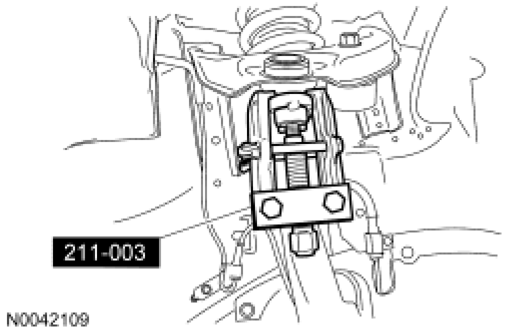

Fig. 24: Identifying Special Tool 211-003
Courtesy of FORD MOTOR CO.

7. Position the shock absorber and spring assembly toward the wheel knuckle to access the upper arm-to-body bolts.
8. Remove the 2 upper arm-to-body bolts and the upper arm.
    - Discard the bolts.

INSTALLATION

NOTE: Do not tighten the upper arm-to-body bolts at this time.

1. Position the upper arm and install the 2 new upper arm-to-body bolts.
2. Set the upper arm bushing fastener tightening position by aligning the hole in the upper arm with the hole in the body bracket and inserting a 6.35 mm (0.25 in) drill bit through both holes.

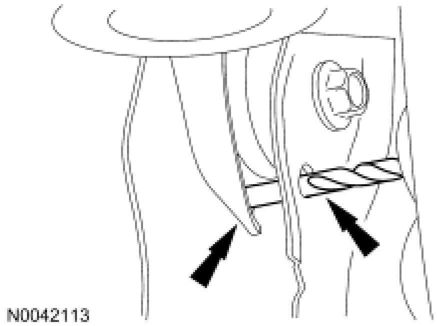

Fig. 25: Locating Upper Arm With Hole In Body Bracket
Courtesy of FORD MOTOR CO.

3. Tighten the upper arm-to-body bolts to 55 Nm (41 lb-ft) and remove the drill bit.
4. Position the shock and spring assembly and install the 3 new shock upper mount nuts.
   - Tighten to 30 Nm (22 lb-ft).
5. Position the upper ball joint and install a new nut.
   - Tighten to 48 Nm (35 lb-ft).
6. If equipped, position the wheel speed sensor harness and install the bolt.
   - Tighten to 23 Nm (17 lb-ft).
7. If equipped, position the wheel speed sensor and install the bolt.
   - Tighten to 23 Nm (17 lb-ft).
8. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
9. Check and, if necessary, align the front end. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

STABILIZER BAR LINK

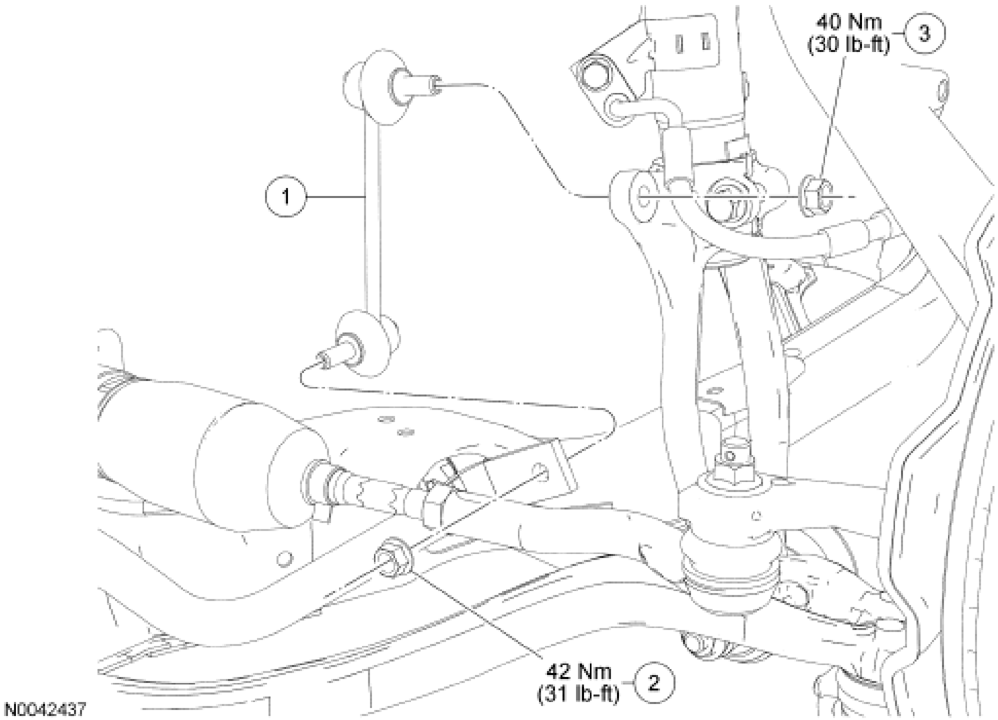

Fig. 26: Exploded View Of Stabilizer Bar Link With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3053 LH/ 3052 RH	Stabilizer bar link
2	3C494	Stabilizer bar link lower nut
3	3C494	Stabilizer bar link upper nut

REMOVAL AND INSTALLATION

NOTE: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

   NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

2. Remove and discard the stabilizer bar link upper nut.
   - To install, tighten the new nut to 40 Nm (30 lb-ft).

NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

3. Remove and discard the stabilizer bar link lower nut and remove the stabilizer bar link.
   - To install, tighten the new nut to 42 Nm (31 lb-ft).
4. To install, reverse the removal procedure.

STABILIZER BAR BUSHING

Special Tools

Illustration	Tool Name	Tool Number

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
9	W520414	Stabilizer bar bracket nut (4 required)
10	5486	Stabilizer bar bushing bracket (2 required)
11	5484	Stabilizer bar bushing (2 required)
12	3C497	Steering gear-to-subframe bolt (3 required)

REMOVAL AND INSTALLATION

NOTE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if**

replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

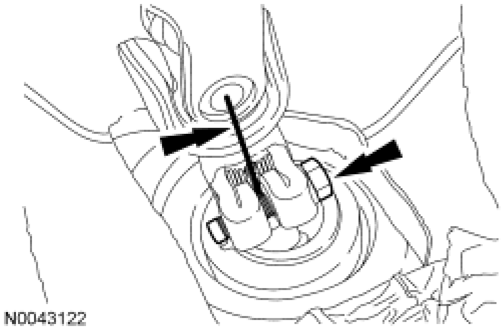
All vehicles

1. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
2. Remove the 2 lower steering column shaft joint cover bolts and cover.

NOTE:	**Do not allow the steering column shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to <u>SUPPLEMENTAL RESTRAINT SYSTEM</u> article.**

NOTE:	**Index the steering column shaft position to the steering gear for reference during installation.**

3. Remove the bolt and disconnect the steering column shaft from the steering gear.
   - To install, align the index marks, tighten to 25 Nm (18 lb-ft).



<u>Fig. 29: Locating Steering Column Shaft Index Mark And Bolt</u>
Courtesy of FORD MOTOR CO.

NOTE:	**Remove the steering column shaft-to-dash seal or damage to the seal can occur.**

NOTE:	**Make sure that the dash seal is correctly installed on the steering gear and the retaining clips are fully engaged into the body or damage to the steering gear can result.**

4. Remove the steering column shaft-to-dash seal.

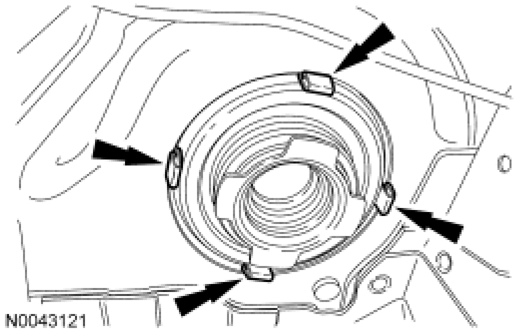


Fig. 30: Locating Steering Column Shaft-To-Dash Seal
Courtesy of FORD MOTOR CO.

5. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
6. Remove the 8 screws and position the LH and RH splash shields aside.

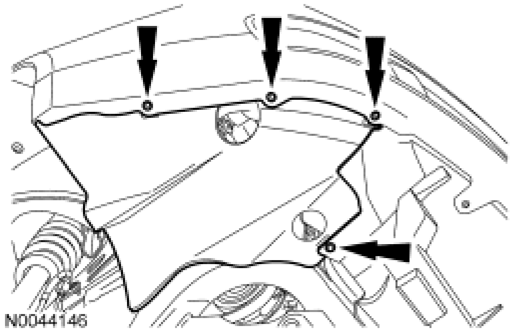

Fig. 31: Locating Screws And Position LH And RH Splash Shields Aside
Courtesy of FORD MOTOR CO.

7. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

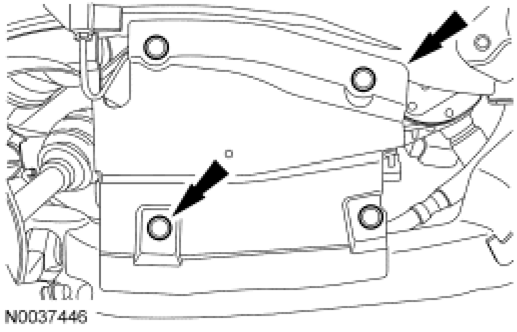

Fig. 32: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

8. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

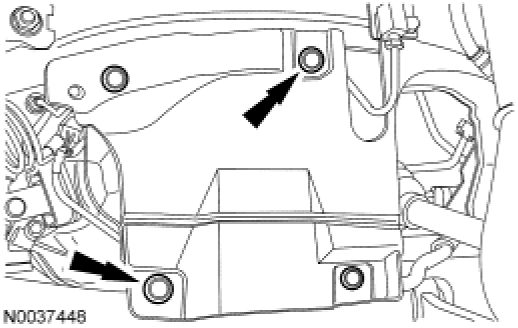

Fig. 33: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

9. If equipped, remove the bolts and the underbody cover shield.
   - To install, tighten 7 Nm (62 lb-in).
10. Remove and discard the 2 tie-rod end cotter pins and nuts.
    - To install, tighten the new nuts to 48 Nm (35 lb-ft).
    - Install a new cotter pin.

NOTE: **Do not use a hammer to separate the tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.**

NOTE: **RH shown, LH similar.**

11. Using the Tie-Rod End Remover, separate the 2 tie-rod ends from both wheel knuckles.

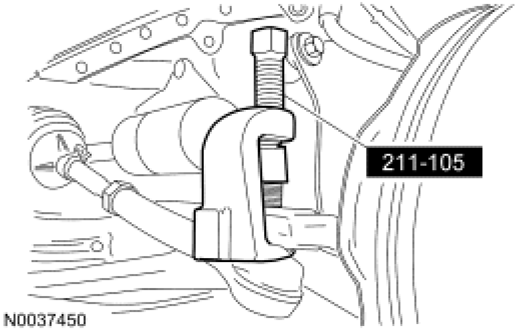

Fig. 34: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

12. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.
    - To install, tighten the new nuts to 40 Nm (30 lb-ft).

All-Wheel Drive (AWD) vehicles

13. Index the rear driveshaft-to-Power Transfer Unit (PTU).

- Remove the 4 bolts and position the driveshaft aside.
- To install, tighten to 70 Nm (52 lb-ft).

All vehicles

14. Remove RH steering gear-to-subframe bolt.
    - To install, tighten to 107 Nm (79 lb-ft).
15. Remove the 2 LH steering gear-to-subframe bolts and position the steering gear to access the stabilizer bar LH bracket front nut.
    - To install, tighten to 107 Nm (79 lb-ft).
16. Remove and discard the 4 stabilizer bar bracket nuts and remove the 2 stabilizer bar brackets.
    - To install, tighten the new bracket nuts to 48 Nm (35 lb-ft).
17. Remove the 2 stabilizer bar bushings.

NOTE: **Before tightening the stabilizer bar bracket nuts, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**

18. To install, reverse the removal procedure.

REMOVAL AND INSTALLATION

NOTE: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

All vehicles

1. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
2. Remove the 2 lower steering column shaft joint cover nuts and cover.

NOTE:	**Do not allow the steering column shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.**

NOTE:	**Index the steering column shaft position to the steering gear for reference during installation.**

3. Remove the bolt and disconnect the steering column shaft from the steering gear.
    - To install, align the index marks, tighten to 25 Nm (18 lb-ft).

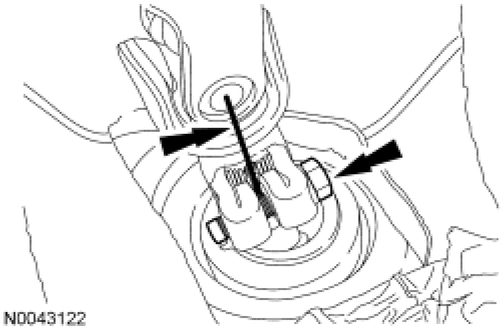

Fig. 39: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**Remove the steering column shaft-to-dash seal or damage to the seal can occur.**

NOTE:	**Make sure that the dash seal is correctly installed on the steering gear and the retaining clips are fully engaged into the body or damage to the steering gear can result.**

4. Remove the steering column shaft-to-dash seal.

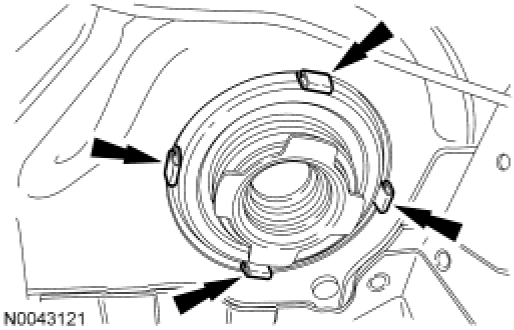

Fig. 40: Locating Steering Column Shaft-To-Dash Seal
Courtesy of FORD MOTOR CO.

5. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
6. Remove the 8 screws and position the LH and RH splash shields aside.

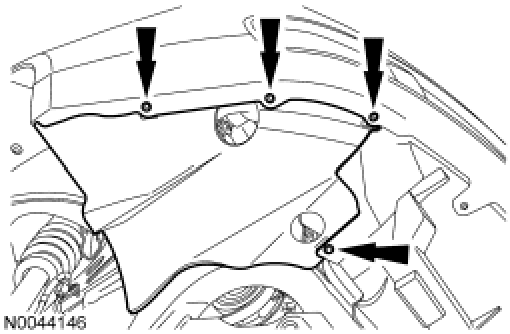

Fig. 41: Locating Screws And Position LH And RH Splash Shields Aside
Courtesy of FORD MOTOR CO.

7. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

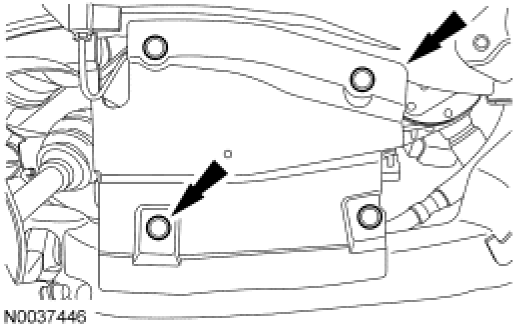

Fig. 42: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

8. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

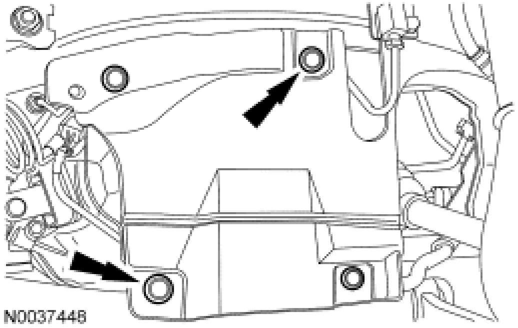

Fig. 43: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

9. If equipped, remove the bolts and the underbody cover shield.

- To install, tighten 7 Nm (62 lb-in).

10. Remove and discard the 2 tie-rod end cotter pins and nuts.
    - To install, tighten the new nuts to 48 Nm (35 lb-ft) and install new cotter pins.

NOTE: Do not use a hammer to separate the tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.

NOTE: RH shown, LH similar.

11. Using the Tie-Rod End Remover, separate the tie-rod ends from both wheel knuckles.

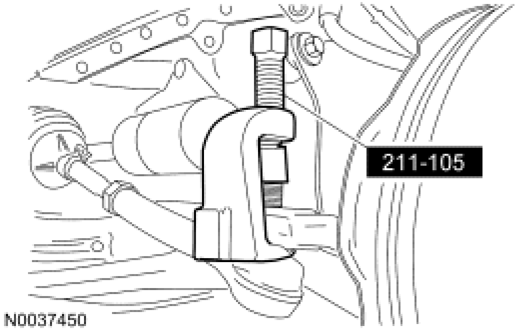

Fig. 44: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nuts.

12. Remove and discard the 2 stabilizer bar link lower nuts and disconnect both stabilizer bar links from the stabilizer bar.
    - To install, tighten the new nuts to 42 Nm (31 lb-ft).
13. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.
    - To install, tighten the new nuts to 40 Nm (30 lb-ft).

All-Wheel Drive (AWD) vehicles

14. Index the rear driveshaft-to-Power Transfer Unit (PTU).
    - Remove the 4 bolts and position the driveshaft aside.
    - To install, tighten the new bolts to 70 Nm (52 lb-ft).

All vehicles

15. Using 2 suitable jackstands, support the rear of the subframe assembly.
16. Remove and discard the 4 subframe bracket-to-body bolts, the 2 subframe bracket-to-subframe nuts and

lower the rear of the subframe.

- To install, tighten the new bolts to 103 Nm (76 lb-ft).
- To install, tighten the new nuts to 150 Nm (111 lb-ft).

17. Remove the RH steering gear-to-subframe bolt.
    - To install, tighten to 107 Nm (79 lb-ft).
18. Remove the 2 LH steering gear-to-subframe bolts and position the steering gear to access the stabilizer bar LH bracket front nut.
    - To install, tighten to 107 Nm (79 lb-ft).
19. Remove and discard the 4 stabilizer bar bracket nuts and remove the 2 stabilizer bar brackets.
    - To install, tighten the new bracket nuts to 48 Nm (35 lb-ft).
20. Remove the 2 stabilizer bar bushings.
21. Remove the stabilizer bar through the LH wheel opening.

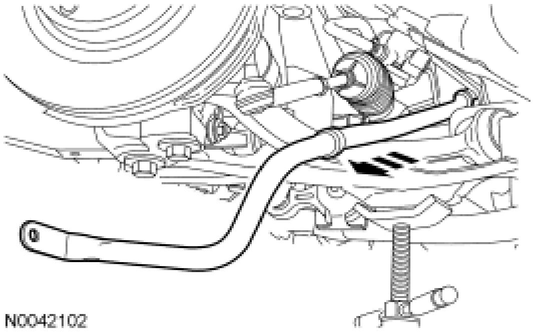

Fig. 45: Removing Stabilizer Bar LH Wheel Opening
Courtesy of FORD MOTOR CO.

NOTE:	**Before tightening the stabilizer bar bracket nuts, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**

22. To install, reverse the removal procedure.

 ST2945-A	Separator, Ball Joint	204-592

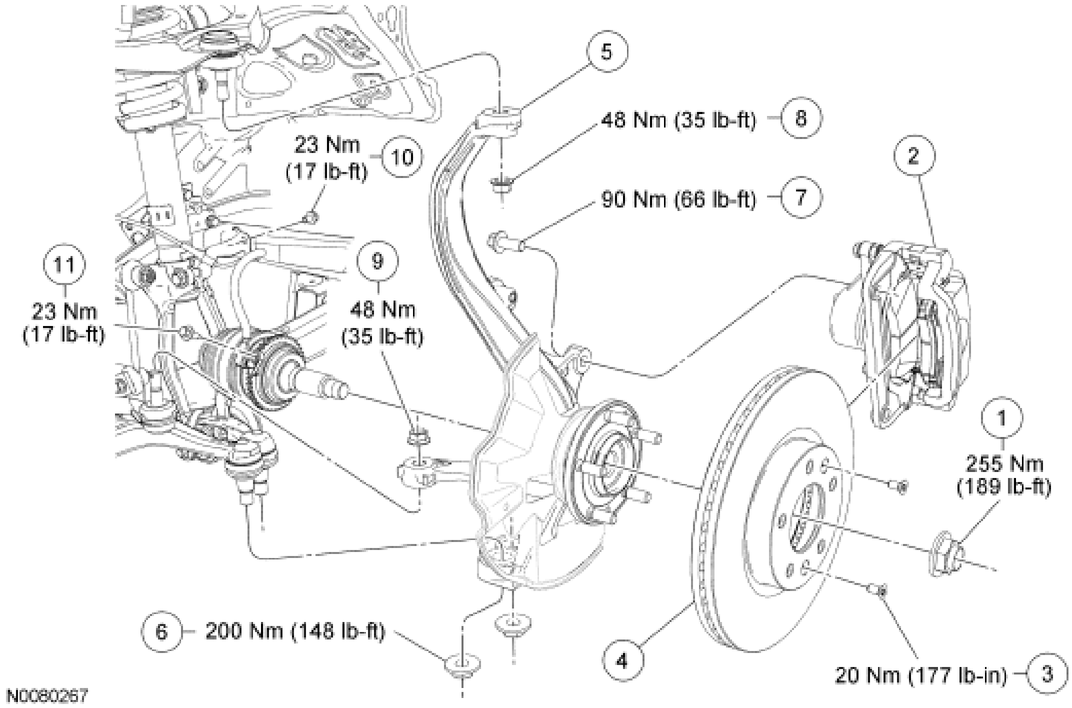

Fig. 47: Exploded View Of Wheel Knuckle With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3N405	Halfshaft nut
2	-	Brake caliper and anchor plate assembly
3	W505741	Brake disc bolt (2 required)
4	1032	Brake disc
5	3K171 LH/ 3K170 RH	Wheel knuckle
6	3C499	Lower ball joint nut (2 required)
7	W711241	Brake caliper anchor plate bolt (2 required)
8	3C498	Upper ball joint nut
9	3D000	Tie-rod end nut
10	W500020	Wheel speed sensor harness bolt
11	W500222	Wheel speed sensor bolt

REMOVAL

NOTE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. If equipped, remove the wheel speed sensor bolt.
3. If equipped, remove the wheel speed sensor harness bolt and position the wheel speed sensor aside.

NOTE: Apply the brake to keep the halfshaft from rotating.

4. Remove and discard the halfshaft nut.

NOTE: Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

5. Remove the bolts and position the caliper and anchor plate assembly aside.
   - Support the caliper and anchor plate assembly using mechanic's wire.
6. Remove the 2 brake disc bolts and the brake disc.
7. Using the Front Hub Remover, separate the halfshaft from the wheel hub.

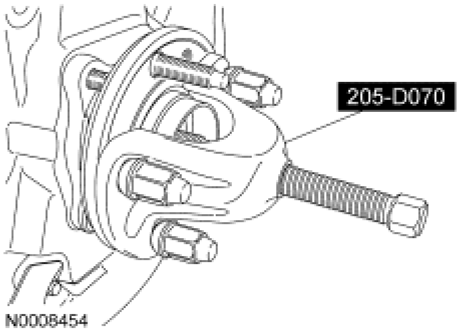

Fig. 48: Pressing Halfshaft From Wheel Bearing & Hub
Courtesy of FORD MOTOR CO.

8. Remove and discard the upper ball joint nut.
9. Using the Steering Arm Remover, separate the upper ball joint from the wheel knuckle.

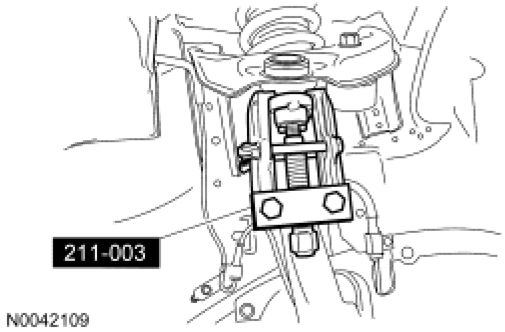

Fig. 49: Identifying Special Tool 211-003
Courtesy of FORD MOTOR CO.

10. Remove and discard the tie-rod end cotter pin and nut.

NOTE: Do not use a hammer to separate the tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.

11. Using the Tie-Rod End Remover, separate the tie-rod end from the wheel knuckle.

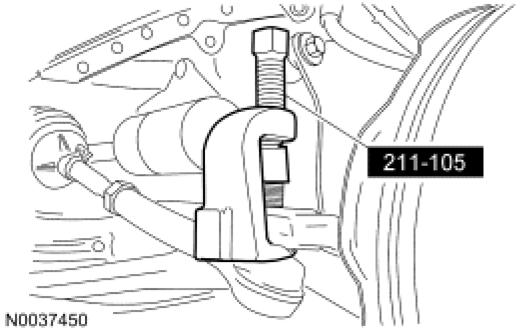

Fig. 50: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

12. Remove and discard the 2 lower ball joint nuts.

NOTE: When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.

NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

13. Using the Ball Joint Separator and Adapter, separate the 2 lower ball joints from the wheel knuckle and remove the wheel knuckle.

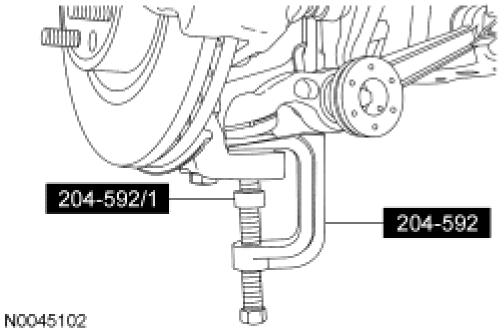

Fig. 51: Identifying Special Tool 204-592/1 And 204-592
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Position the wheel knuckle and install the 2 new lower ball joint nuts.
   - Tighten to 200 Nm (148 lb-ft).
2. Position the tie-rod end and install the new nut and cotter pin.
   - Tighten to 48 Nm (35 lb-ft).
3. Position the upper ball joint and install the new nut.
   - Tighten to 48 Nm (35 lb-ft).
4. If equipped, position the wheel speed sensor and install the bolt.
   - Tighten to 23 Nm (17 lb-ft).
5. If equipped, install the wheel speed sensor harness bolt.
   - Tighten to 23 Nm (17 lb-ft).
6. Position the brake caliper and anchor plate assembly and install the 2 bolts.
   - Tighten to 90 Nm (66 lb-ft).
7. Install the brake disc and the 2 brake disc bolts.
   - Tighten to 20 Nm (177 lb-in).
8. Using the Halfshaft Installer, install the halfshaft into the wheel hub.

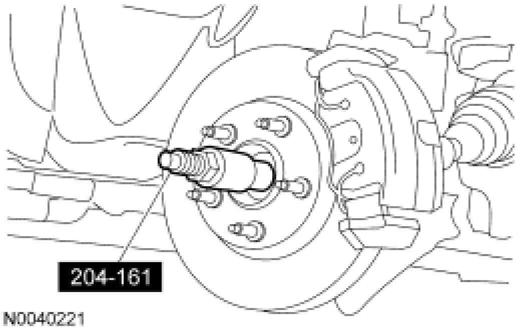

Fig. 52: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

NOTE:	**Do not tighten the halfshaft nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

NOTE:	**Apply the brake to keep the halfshaft from rotating.**

9. Install the halfshaft nut.
   - Tighten to 255 Nm (189 lb-ft).

SHOCK ABSORBER AND SPRING ASSEMBLY

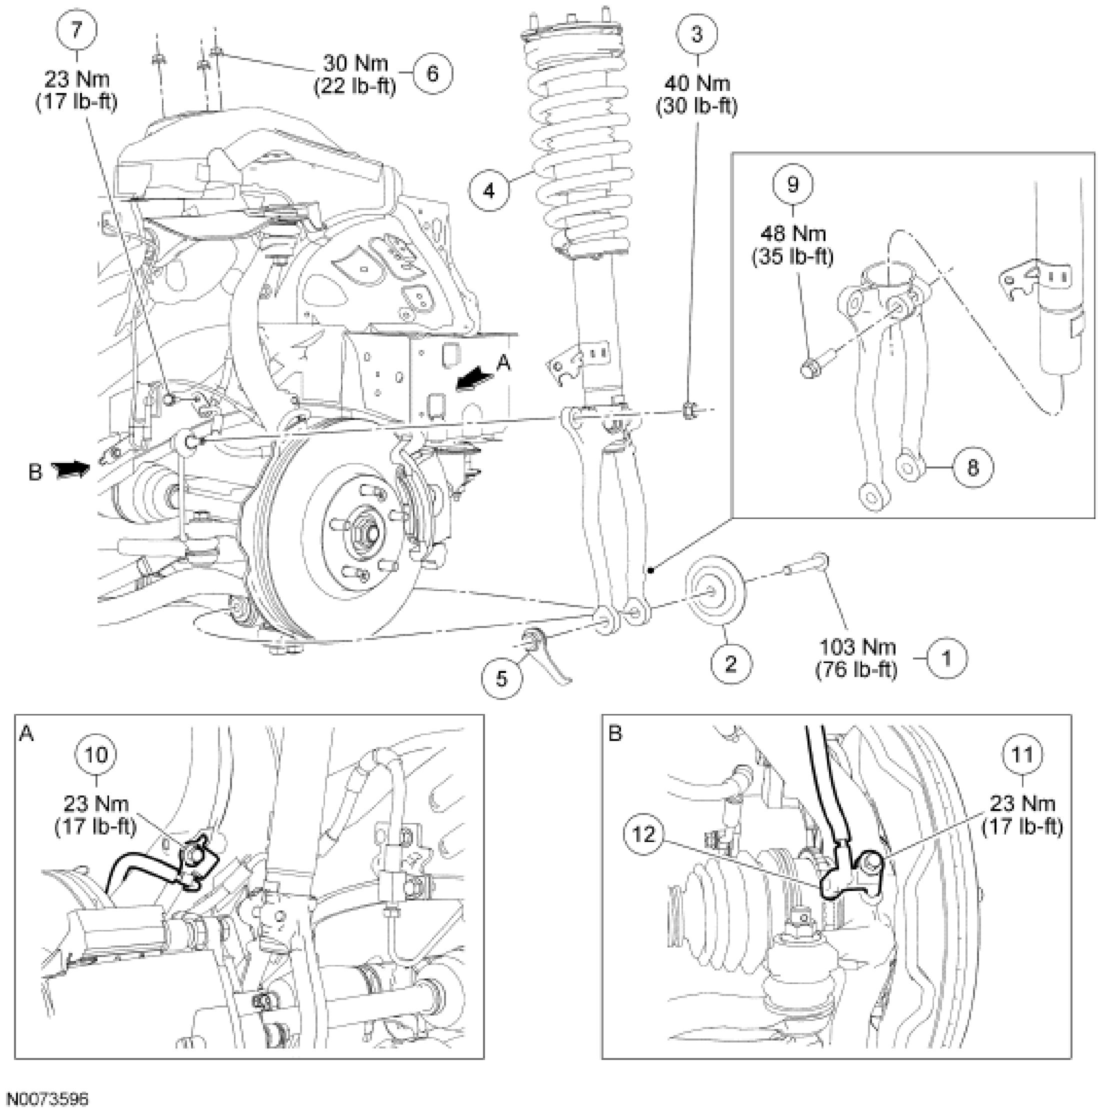

Fig. 53: Exploded View Of Shock Absorber & Spring Assembly With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500550	Damper fork-to-lower arm bolt
2	3C156	Damper
3	3C494	Stabilizer bar link upper nut
4	-	Shock absorber and spring assembly
5	W302117	Damper fork-to-lower arm flag nut
6	W302128	Shock absorber upper mount nut (3 required)
7	-	Brake tube bracket bolt

8	3462	Damper fork
9	W302119	Shock absorber-to-damper fork bolt
10	W500020	Wheel speed sensor harness bolt
11	W500222	Wheel speed sensor bolt
12	2C204 RH/ 2C205 LH	Wheel speed sensor

REMOVAL AND INSTALLATION

NOTE: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove and discard the 3 shock absorber upper mount nuts.
   - To install, tighten the new nuts to 30 Nm (22 lb-ft).
2. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
3. Remove the brake tube bracket bolt and position the brake line aside.
   - To install, tighten to 23 Nm (17 lb-ft).
4. If equipped, remove the wheel speed sensor bolt.
   - To install, tighten to 23 Nm (17 lb-ft).
5. If equipped, remove the wheel speed sensor harness bolt and position the wheel speed sensor aside.
   - To install, tighten to 23 Nm (17 lb-ft).
6. Using a suitable jack, support the wheel knuckle at the lower ball joints.

   NOTE: Use the holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

7. Remove and discard the stabilizer bar link upper nut.
   - To install, tighten the new nut to 40 Nm (30 lb-ft).
8. Remove the damper fork-to-front lower arm bolt, flag nut and damper.
   - Discard the bolt and flag nut.
   - To install, tighten the new bolt and flag nut to 103 Nm (76 lb-ft) with the suspension at the bushing fastener tightening position.
9. Remove and discard the shock absorber-to-damper fork bolt and separate the damper fork from the shock absorber and spring assembly.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).
10. Lower the wheel knuckle and remove the shock absorber and spring assembly.

    NOTE: Before tightening any suspension bushing fasteners, the suspension must

be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.

11. To install, reverse the removal procedure.
12. For additional information on the disassembly and assembly of the shock absorber and spring assembly, refer to **Shock Absorber and Spring Assembly**.

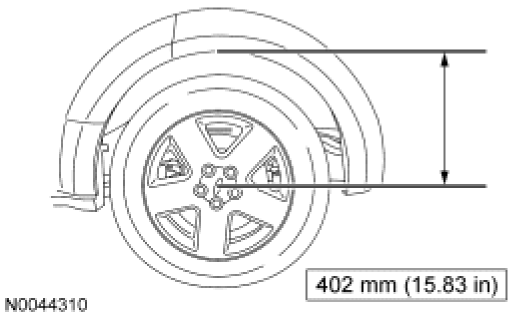

Fig. 54: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

DISASSEMBLY AND ASSEMBLY

SHOCK ABSORBER AND SPRING ASSEMBLY

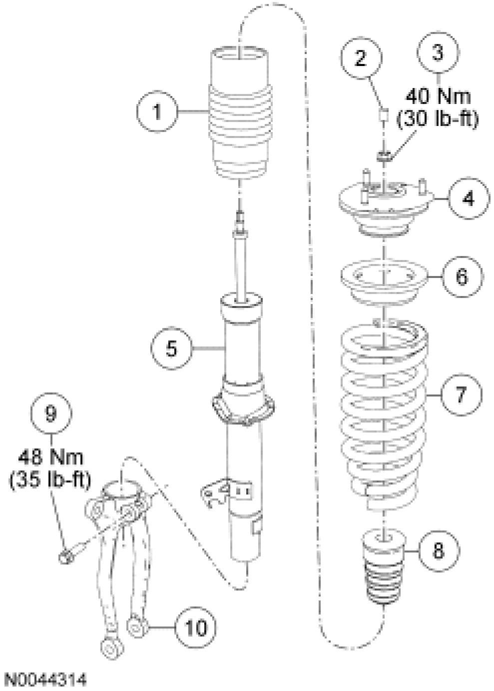

Fig. 55: Exploded View Of Shock Absorber & Spring Assembly With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3C239	Dust boot
2	18A179	Shock absorber rod protective cap
3	18A161	Shock absorber rod nut
4	18183	Shock absorber upper mount
5	18184	Shock absorber and lower mount assembly
6	5793	Spring upper seat
7	5310	Spring
8	18198	Jounce bumper
9	W302119	Shock absorber-to-damper fork bolt
10	3463 LH/ 3462 RH	Damper fork

DISASSEMBLY AND ASSEMBLY

WARNING: **Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Keep all body parts clear of shock absorbers or strut rods. Shock absorbers or struts can extend unassisted. Failure to follow this instruction may result in serious personal injury.**

WARNING: **The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

NOTE: **The coil spring is coated with long-term corrosion protective paint. Do not damage the paint during component servicing or damage to the coil spring may occur.**

NOTE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the shock absorber and spring assembly. For additional information, refer to **Shock Absorber and Spring Assembly**.

WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

2. Position the shock and spring assembly in a suitable spring compressor.
3. Compress the spring enough to relieve the tension on the shock and spring assembly.
4. Remove the shock rod protective cap.

NOTE: Do not use an impact wrench on the shock absorber rod nut or damage to the shock absorber may occur.

NOTE: Use the hex-holding feature to prevent the shock absorber rod from turning while removing or installing the nut.

5. While holding the shock absorber rod, remove and discard the nut.
    - To install, tighten the new nut to 40 Nm (30 lb-ft).
6. Remove the shock absorber and lower mount assembly.
7. Remove the dust boot.
8. Remove the shock absorber upper mount and spring upper seat.
9. Carefully release the tension on the spring compressor and remove the spring.
10. Remove and discard the shock absorber-to-damper fork bolt, then separate the shock and damper fork.
    - To install, tighten the new bolt to 48 Nm (35 lb-ft).

NOTE: Before tightening the shock absorber rod nut, position the end of the spring within 0-10 mm (0-0.39 in) of the step on the spring mount.

11. To assemble, reverse the disassembly procedure.

Throttle body (TB) bolts	10	89

DESCRIPTION AND OPERATION

FUEL CHARGING AND CONTROLS

Sequential Multi-Port Fuel Injection (SFI)

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

The fuel charging and controls system consists of the:

- throttle body (TB).
- fuel injectors.
- fuel rail.

The fuel charging and controls system is:

- a sequential multi-port fuel injection (SFI) system.
- pulse-width modulated.

- mass air flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand, on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor, which measures the amount of air being drawn into the engine.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body (TB)

CAUTION: Do not hold the throttle plate open with any object that could scratch the bore or plate while servicing or cleaning the throttle body (TB). Refer to Throttle Body.

The TB:

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- must be removed from the vehicle to be cleaned.

Refer to **Throttle Body**.

Fuel Injectors

The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel into the intake port in the cylinder head.
- are deposit resistant.

For removal and installation, refer to **Fuel Rail and Fuel Injector - Exploded View** and **Fuel Rail**.

Fuel Rail

CAUTION: The fuel injectors and the fuel rail must be handled with extreme care to prevent damage to sealing areas and sensitive fuel-metering orifices.

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

For removal and installation, refer to **Fuel Rail and Fuel Injector - Exploded View** and **Fuel Rail**.

DIAGNOSTIC TESTS

FUEL CHARGING AND CONTROLS

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

THROTTLE BODY

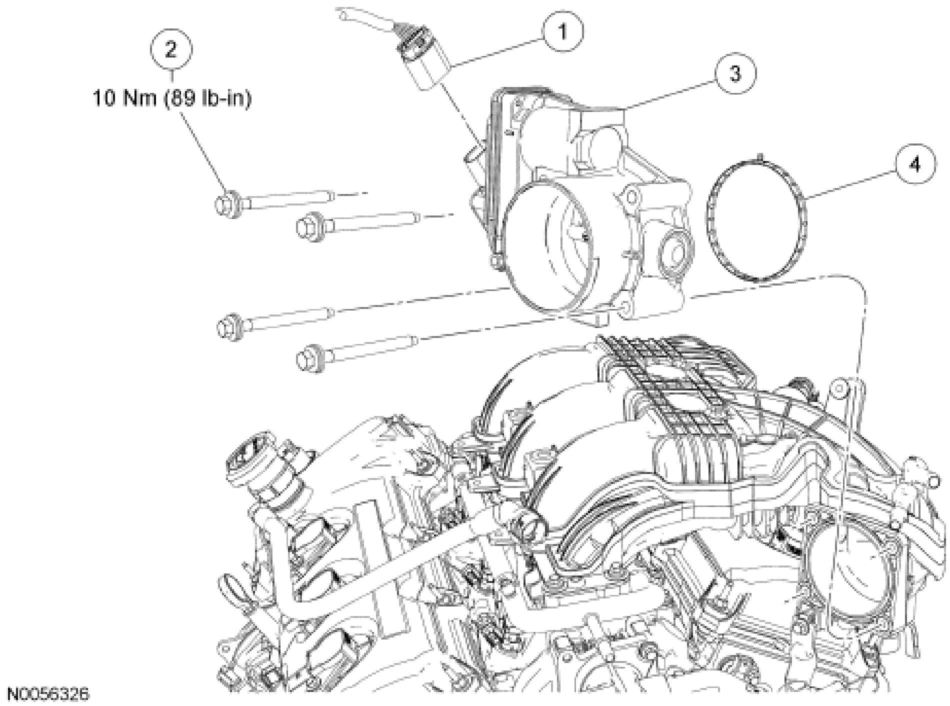

Fig. 1: Exploded View Of Throttle Body With Torque Specification

Item	Part Number	Description
1	14A464	Electronic throttle control electrical connector (part of 12B637)
2	W503285	Throttle body (TB) bolt (4 required)
3	9E926	TB
4	9E936	TB gasket

REMOVAL AND INSTALLATION

CAUTION: The throttle body (TB) must be removed from the vehicle to be cleaned. Do not hold the throttle plate open with any object that could scratch the bore or plate while servicing or cleaning the TB.

1. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
2. Disconnect the electronic throttle control electrical connector.
3. Remove the 4 bolts and the throttle body (TB).
    - Discard the TB gasket.
    - To install, tighten to 10 Nm (89 lb-in).

NOTE: Install a new TB gasket.

4. To install, reverse the removal procedure.

FUEL RAIL AND FUEL INJECTOR - EXPLODED VIEW

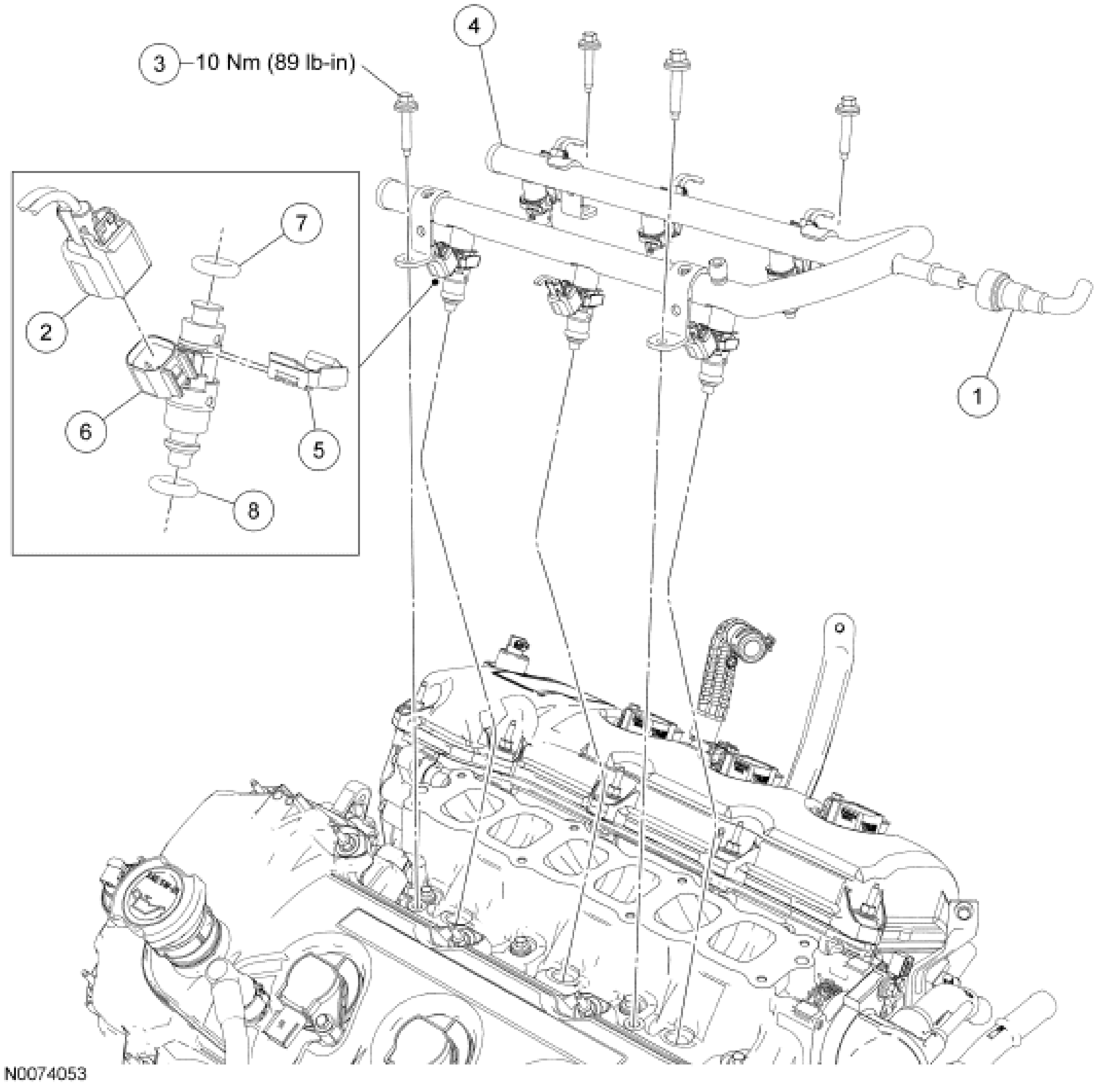

Fig. 2: Exploded View Of Fuel Rail & Fuel Injector With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

FUEL RAIL

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

REMOVAL

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

1. Release the fuel system pressure. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
4. Disconnect the fuel tube-to-fuel rail spring lock coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
5. Disconnect the 6 fuel injector electrical connectors.
6. Remove the 4 fuel rail bolts.
7. Remove the fuel rail and injectors as an assembly.
8. Remove the 6 fuel injector clips and the 6 fuel injectors.
    - Remove and discard the 12 fuel injector O-ring seals.

INSTALLATION

CAUTION: **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals can cause the fuel system to leak. Do not reuse the O-ring seals.**

NOTE: The upper and lower O-ring seals are not interchangeable.

NOTE: Install new fuel injector O-ring seals and lubricate them with clean engine oil.

1. Install the 6 fuel injectors and the 6 fuel injector clips into the fuel rail.
2. Install the fuel rail and fuel injectors as an assembly.
3. Install the 4 fuel rail bolts.
   - Tighten to 10 Nm (89 lb-in).
4. Connect the 6 fuel injector electrical connectors.
5. Connect the fuel tube-to-fuel rail spring lock coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
6. Install the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
7. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

2008 ENGINE PERFORMANCE

Fuel Pressure Specifications - 2008

FUEL SYSTEMS

FUEL PRESSURE - CARS

2008 FUEL PRESSURE SPECIFICATIONS - CARS

Engine	KOER psi (kg/cm^2)	KOEO psi (kg/cm^2)
Crown Victoria & Grand Marquis		
Gasoline	25-40 (1.8-2.8)	20-60 (1.4-4.2)
Focus	55 (3.9)	(1)
Fusion & Milan		
2.3L	57 (4.0)	(1)
3.0L	65 (4.6)	(1)
MKZ	65 (4.6)	(1)
Mustang	27-37 (1.9-2.6)	35-70 (2.4-4.9)
Sable, Taurus & Taurus X	65 (4.6)	65 (4.6)
Town Car	25-40 (1.8-2.8)	20-60 (1.4-4.2)

(1) Information is not available from manufacturer.

(2) With a manual gauge, the fuel pressure will be lower.

(3) Based on 60°C (140°F) fuel rail temperature, at fuel rail temperatures above 60°C (140°F), for example hot starts, the fuel rail pressure increases based on temperature up to 448 kPa (65 psi).

FUEL PRESSURE - TRUCKS

2008 FUEL PRESSURE SPECIFICATIONS - TRUCKS

DESCRIPTION AND OPERATION

FUEL SYSTEM

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction**

may result in serious personal injury.

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

The fuel system consists of:

- a mechanical returnless fuel system.
- a fuel rail.
- a fuel rail mounted Schrader valve on all 3.0L engines and early build 3.5L engines.
- a multi-port fuel injection (MFI) system.
- an all wheel drive (AWD) saddle-type or front wheel drive (FWD) standard fuel tank.
- fuel, vapor and brake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- a fuel tank filler pipe assembly, which cannot be modified in any way, that also contains a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- a 1/4 turn-type fuel tank filler cap.
- an inertia fuel shutoff (IFS) switch.
- a fuel pump (FP) module containing:
  - an electric FP, which provides pressurized fuel to the fuel rail.
  - a fuel level sender.
  - a check valve, which maintains system pressure after the FP is shut off.
  - a pressure relief valve for overpressure protection in the event of restricted fuel flow.
  - an in tank fuel filter providing filtration to protect the fuel injectors from foreign material.
- an individual fuel level sensor, AWD vehicles only.

The FP is controlled by the PCM. Electrical power to the FP is provided through the IFS switch located under the right front door scuff plate.

The engines are equipped with sequential multi-port fuel injection.

The fuel pressure is regulated to a constant pressure by a pressure regulator.

DIAGNOSTIC TESTS

FUEL SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module	

 ST1137-A	(VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

NOTE: The following procedure diagnoses a slow to fill concern only. For all other concerns refer to the Introduction - Gasoline Engines article.

The fuel tank filler pipe assembly is used to refuel the vehicle. The fuel tank inlet check valve prevents spit back of fuel during and after refueling. The fuel tank stores the fuel. The fuel tank contains a fuel pump (FP) module. The FP module consists of a fuel level sensor and a FP. The fuel level sender sends a signal to the fuel gauge informing the driver of how much fuel is in the fuel tank. The FP provides fuel to the fuel tubes which supply the fuel rail.

During refueling, the fuel tank vents to the atmosphere through the vent and filler pipes, on vehicles without on-board refueling vapor recovery (ORVR) systems. In vehicles equipped with ORVR the fuel tank and filler pipe are designed so that when the vehicle is being refueled, fuel vapors in the fuel tank travel to the evaporative emission (EVAP) canister, which absorbs the fuel vapors and vents the pressure from the fuel tank during refueling.

Inspection and Verification

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

1. Verify the customer's concern by refueling the vehicle and observe the fuel fill rate.
2. Inspect to determine if any of the following mechanical concerns apply.

VISUAL INSPECTION CHART

Mechanical
• Bent, kinked or damaged fuel tank filler pipe • Bent, kinked or damaged fuel tank filler pipe vent tube (if equipped) • Incorrect routing of the fuel tank filler pipe • Incorrect routing of the fuel tank filler pipe vent tube (if equipped) • Incorrect position of fuel tank filler pipe clamps • Incorrect position of fuel tank filler pipe vent tube clamps (if equipped) • Fuel tank mounted vapor tubes bent or damaged • Evaporative emission (EVAP) system tubes or hoses bent or damaged • Accident damage to the fuel tank • Accident damage to the vehicle effecting the fuel tank filler pipe-to-body connection • Unauthorized modifications and/or alterations to the vehicle • EVAP system fresh air tube plugged (dirt, spider webbing)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE**

COMMUNICATIONS NETWORK article.
- If the network test passes, retrieve and record continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the evaporative emission (EVAP) system.
9. If the DTCs retrieved are related to the concern, go to Evaporative Emission System DTC Chart. For PCM related DTCs, refer to the **Introduction - Gasoline Engines** article. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Evaporative Emission System DTC Chart

EVAPORATIVE EMISSION SYSTEM DTC CHART

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Slow to fill	• Fuel tank filler pipe • Fuel tank filler pipe vent tube, if equipped • Evaporative emission (EVAP) system • Fuel tank inlet check valve (part of the fuel tank) • Fuel level vent valve (part of the fuel tank)	• Go to **Pinpoint Test A**.
• All other fuel system concerns	• Fuel system components	• REFER to the **Introduction - Gasoline Engines** article.

Pinpoint Test

Pinpoint Test A: Slow to Fill

Normal Operation

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank air is vented through the filler pipe or the on-board refueling vapor recovery (ORVR) system.

This pinpoint test is intended to diagnose the following:

- Fuel tank filler pipe vent tube, if equipped
- Fuel tank filler pipe
- Evaporative emission (EVAP) system
- Fuel tank inlet check valve (part of the fuel tank)
- Fuel level vent valve (part of the fuel tank)

PINPOINT TEST A: SLOW TO FILL

A1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out inspection and verification.
- **Was the cause of the concern found?**

  YES : REPAIR or INSTALL new components to correct the concern.

  NO : Go to A2.

A2 CHECK THE SYSTEM FOR ANY EVAP DTCs

- Connect the scan tool.
- Check the system for any of the following EVAP DTCs: P0446, P0451, P0452, P0453, P0454, P1443, P1450, P1451 and P260F.
- **Are any of these DTCs present?**

  YES : REFER to **Introduction - Gasoline Engines** article to diagnosis the EVAP system.

  NO : Go to A3.

A3 MONITOR THE FUEL TANK PRESSURE (FTP) WHILE FILLING THE FUEL TANK

- Monitor the FTP reference value while filling the fuel tank. REFER to **Introduction - Gasoline Engines** article.
- **Is FTP within specification?**

  YES : Go to A5.

  NO : Go to A4.

A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED

- Disconnect the fuel tank-to-EVAP canister quick connect coupling at the EVAP canister. Refer to **Quick Connect Coupling**.
- Monitor the FTP reference value while filling the fuel tank. REFER to **Introduction - Gasoline Engines** article.

- **Is FTP within specification?**

  YES : INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the restriction or blockage cannot be repaired, INSTALL new EVAP system components.

  NO : Go to A5.

A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION

- Remove the fuel tank filler pipe assembly. REFER to **FUEL TANK AND LINES** article.
- Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction.
- **Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?**

  YES : If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube.

  NO : Go to A6.

A6 CHECK THE FUEL TANK INLET CHECK VALVE

- Inspect the fuel tank inlet check valve for restriction or sticking.
- **Is the fuel tank filler pipe inlet check valve restricted or sticking?**

  YES : If possible, REPAIR the restriction. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to **FUEL TANK AND LINES** article.

  NO : INSTALL a new fuel tank. REFER to **FUEL TANK AND LINES** article.

GENERAL PROCEDURES

FUEL SYSTEM PRESSURE RELEASE

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

1. Remove the RH front door scuff plate.

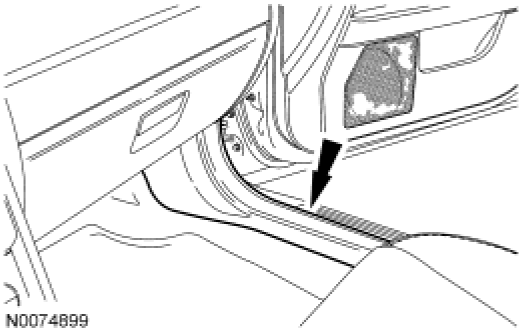

Fig. 1: Identifying RH Front Door Scuff Plate
Courtesy of FORD MOTOR CO.

2. Disconnect the inertia fuel shutoff (IFS) switch.

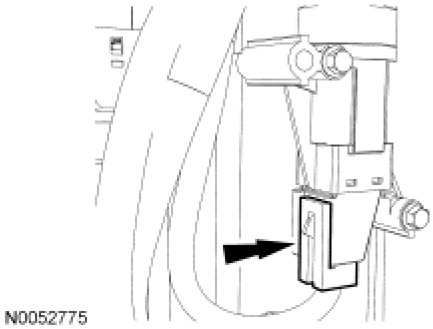

Fig. 2: Locating Inertia Fuel Shutoff (IFS) Switch Electrical Connector
Courtesy of FORD MOTOR CO.

3. Start the engine and allow it to idle until it stalls.
4. After the engine stalls, crank the engine for approximately 5 seconds to make sure the fuel system pressure has been released.
5. Turn the ignition switch to the OFF position.
6. When fuel system service is complete, reconnect the IFS switch electrical connector.

NOTE: It may take more than one key cycle to pressurize the fuel system.

7. Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.
8. Start the vehicle and check the fuel system for leaks.
9. Install the RH front door scuff plate.

FUEL SYSTEM PRESSURE TEST

Special Tools

Illustration	Tool Name	Tool Number
 ST3047-A	Adapter, Fuel Pressure Test	310-180
 ST3038-A	Fuel Pressure Test Kit	310-D009 (D95L-7211A)

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.**

2.3L engine

1. Release the fuel system pressure. For additional information, refer to **Fuel System Pressure Release**.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Disconnect the fuel jumper tube-to-fuel rail quick connect coupling. For additional information, refer to **Quick Connect Coupling**.
4. Install the Fuel Pressure Test Kit between the fuel jumper tube and the fuel rail.

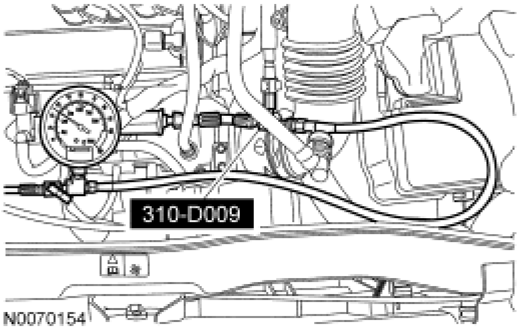

Fig. 3: Identifying Fuel Jumper Tube, Fuel Rail & Special Tool (310-D009)
Courtesy of FORD MOTOR CO.

3.0L (4V) engine

5. Remove the cap and install the Fuel Pressure Test Kit on the fuel rail Schrader valve test port.

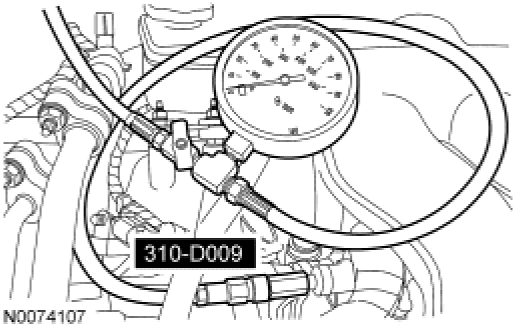

Fig. 4: Identifying Fuel Rail Schrader Valve Test Port & Special Tool (310-D009)
Courtesy of FORD MOTOR CO.

3.5L engine with a fuel rail mounted Schrader valve

6. Remove the cap and install the Fuel Pressure Test Kit on the fuel rail Schrader valve test port.

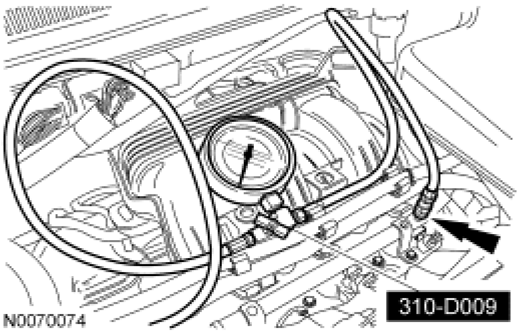

Fig. 5: Installing Special Tool (310-D009) & Slowly Open Manual Valve To Relieve Fuel System Pressure
Courtesy of FORD MOTOR CO.

3.5L engine without a fuel rail mounted Schrader valve

7. Release the fuel system pressure. For additional information, refer to **Fuel System Pressure Release**.
8. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
9. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
10. Disconnect the fuel tube-to-fuel rail spring lock coupling. For additional information, refer to **Spring Lock Couplings**.
11. Install the Fuel Pressure Test Adapter and Fuel Pressure Test Kit between the fuel tube and the fuel rail.

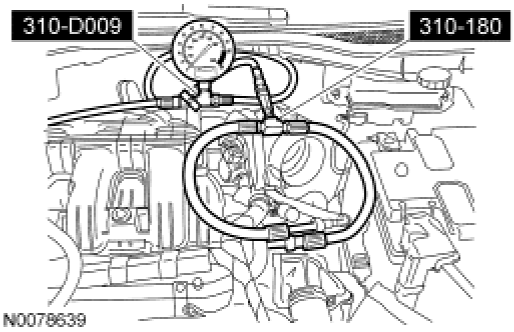

Fig. 6: Identifying Fuel Tube, Fuel Rail & Special Tool (310-D009, 310-180)
Courtesy of FORD MOTOR CO.

NOTE: The air cleaner outlet pipe must be installed prior to completing the fuel system pressure test.

12. Install the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.

3.5L engine without a fuel rail mounted Shrader valve and 2.3L engine

NOTE: The IFS switch was disconnected in the fuel system pressure release.

13. Connect the IFS switch electrical connector.
14. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

All engines

NOTE: Carry out a key ON engine OFF (KOEO) visual inspection for fuel leaks prior to completing the fuel system pressure test.

NOTE: After completion of the fuel system pressure test, open the drain valve on the special tool and release any residual fuel into a suitable container prior

to removing the tool.

15. Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to **SPECIFICATIONS**.

FUEL TANK DRAINING

Special Tools

Illustration	Tool Name	Tool Number
	Fuel Storage Tanker	164-R3202 or equivalent
	Fuel Tank Lock Ring Wrench	310-123
	Fuel Draining Hose	310-102

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

All vehicles

1. Release the fuel system pressure. For additional information, refer to **Fuel System Pressure Release**.

2. Release the fuel tank filler cap and position it aside.

CAUTION: When removing the special tool, the fitting on the end of the hose can become detained by the one-way flapper valve. Carefully remove the hose using a gentle agitating motion to avoid detaching the hose from the fitting.

NOTE: The special tool must be inserted into the fuel tank filler pipe until the fitting on the end of the hose enters into the fuel tank spout, opening the one-way flapper valve.

3. Insert the special tool into the fuel tank filler pipe.

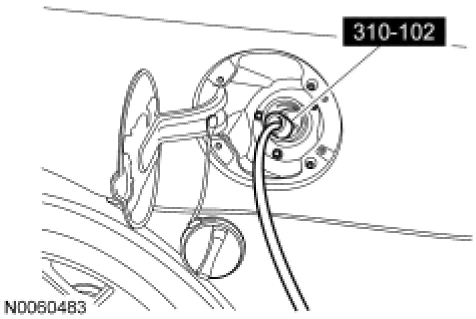

Fig. 7: Inserting Special Tool (310-102) Into Fuel Tank Filler Pipe
Courtesy of FORD MOTOR CO.

NOTE: This step will remove approximately 1/8 tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe.

4. Attach the fuel storage tanker to the special tool and remove as much fuel as possible from the fuel tank and fuel tank filler pipe.
5. Remove the rear seat lower cushion. For additional information, refer to **SEATING** article.

Front wheel drive (FWD) vehicles

6. Remove the 4 screws and the fuel pump (FP) module access cover.

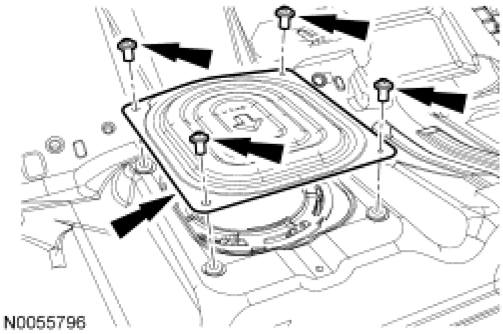

Fig. 8: Identifying Fuel Pump Module Access Cover & Screws
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

7. Remove the 3 screws and the FP module access cover.

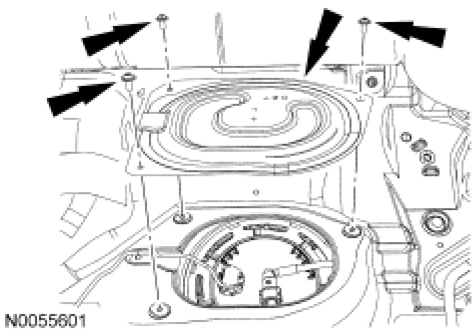

Fig. 9: Identifying Fuel Pump Module Access Cover & Screws
Courtesy of FORD MOTOR CO.

All vehicles

NOTE:	**Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.**

8. Disconnect the FP module electrical connector.

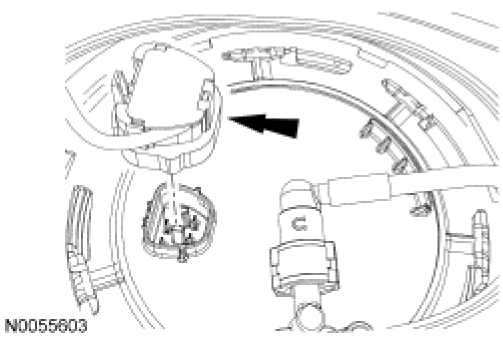

Fig. 10: Identifying Fuel Pump Module Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

9. Disconnect the fuel tube-to-FP module quick connect coupling.

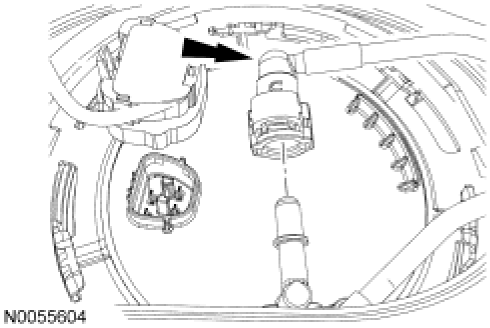

Fig. 11: Identifying Fuel Supply Tube-To-Fuel Pump Module Quick Connect Coupling
Courtesy of FORD MOTOR CO.

NOTE: Make sure to install a new FP module O-ring seal and lock ring.

10. Install the special tool, remove and discard the FP module lock ring.

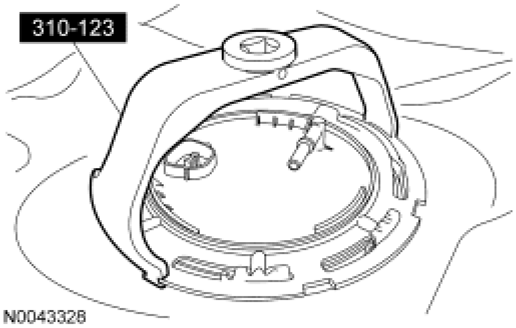

Fig. 12: Identifying Special Tool (310-123)
Courtesy of FORD MOTOR CO.

CAUTION: The fuel pump (FP) module must be handled carefully to avoid damage to the float arm.

11. Position the FP module aside and insert the tube from the fuel storage tanker into the FP module aperture and drain as much fuel from the fuel tank as possible.

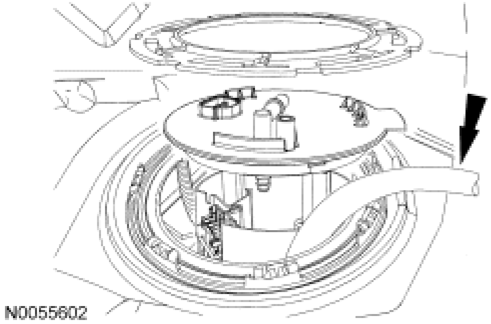

Fig. 13: Identifying Tube From Fuel Storage Tanker
Courtesy of FORD MOTOR CO.

AWD vehicles

12. Remove the 3 screws and the fuel level sensor access cover.

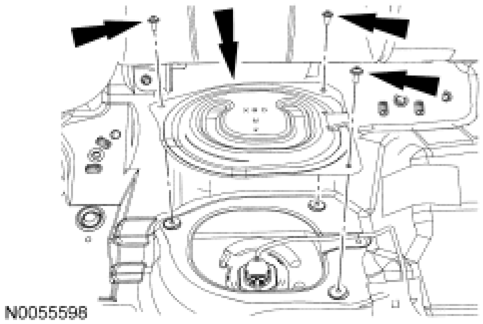

Fig. 14: Identifying Fuel Level Sensor Access Cover & Screws
Courtesy of FORD MOTOR CO.

NOTE: **Clean the fuel level sensor connection, flange surface and the immediate surrounding area of any dirt or foreign material.**

13. Disconnect the fuel level sensor electrical connector.

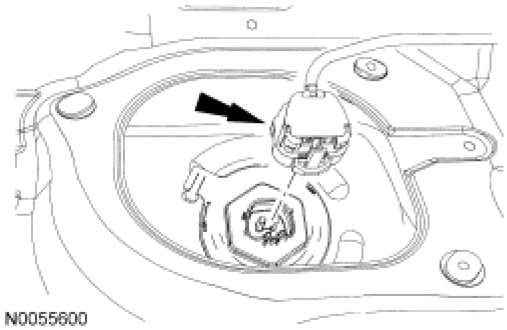

Fig. 15: Identifying Fuel Level Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

14. Release the lock tab, and using a suitable tool, rotate the fuel level sensor counterclockwise approximately 1/4 turn, lift and position aside.

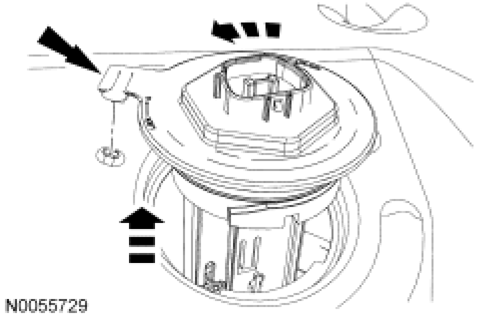

Fig. 16: Rotating Fuel Level Sensor Counterclockwise Approximately 1/4 Turn & Lift Upward
Courtesy of FORD MOTOR CO.

15. Insert the tube from the fuel storage tanker into the fuel level sensor aperture and drain the remainder of the fuel from the fuel tank.

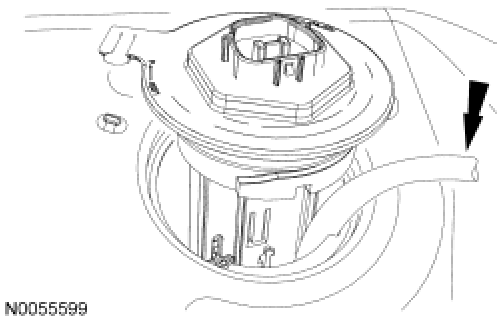

Fig. 17: Identifying Tube From Fuel Storage Tanker
Courtesy of FORD MOTOR CO.

QUICK CONNECT COUPLING

Special Tools

Illustration	Tool Name	Tool Number
	Disconnect Tool, Fuel Pipe (5/16")	310-040

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Disconnect - Type I

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.

CAUTION: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to **Fuel System Pressure Release**.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Depress the locking tab and release the quick connect coupling from the tube.

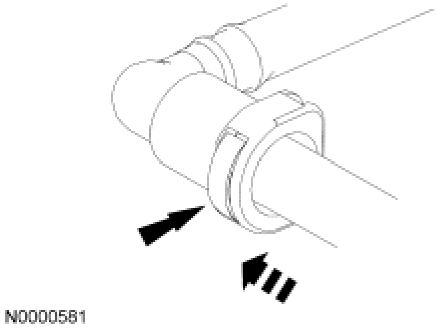

Fig. 18: Locating Fuel Tube Quick Connect Coupling Button
Courtesy of FORD MOTOR CO.

Connect - Type I

NOTE: **Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.**

1. Install the quick connect coupling onto the tube until it is fully seated.

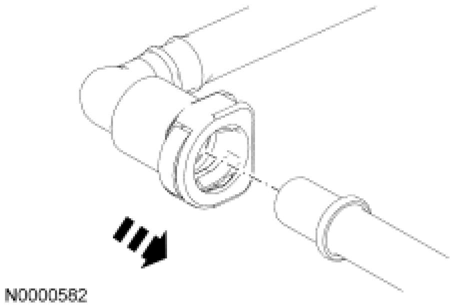

Fig. 19: Installing Quick Connect Coupling Onto Tube
Courtesy of FORD MOTOR CO.

2. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

Disconnect - Type II

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type**

when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.

CAUTION: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. Release the lock tab on the quick connect coupling.

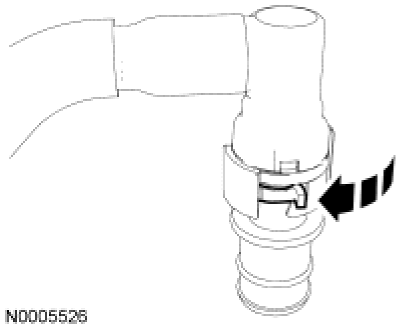

Fig. 20: Positioning Locking Tab Into Unlatched Position
Courtesy of FORD MOTOR CO.

2. Separate the quick connect coupling from the fitting.

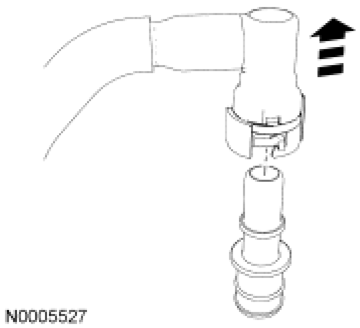

Fig. 21: Identifying Quick Connect Coupling
Courtesy of FORD MOTOR CO.

Connect - Type II

NOTE: **Apply clean engine oil to the O-ring seals.**

NOTE: **Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.**

1. Release the lock tab and install the quick connect coupling onto the fitting.

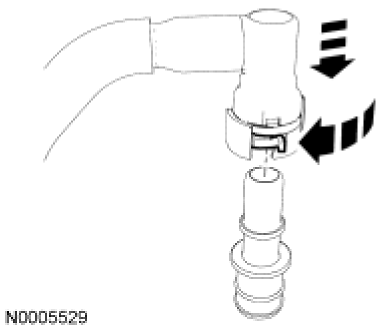

Fig. 22: Identifying Quick Connect Coupling
Courtesy of FORD MOTOR CO.

2. Apply the lock tab into the latched position.

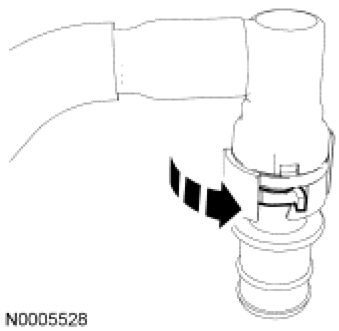

Fig. 23: Positioning Locking Tab Into Latched Position
Courtesy of FORD MOTOR CO.

Disconnect - Type III

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

Fuel level sensor access cover screws	2	-	18
Fuel Pump (FP) module access cover screws	2	-	18
Fuel tank filler pipe bracket nut	10	-	89
Fuel tank filler pipe heat shield nuts	9	-	80
Fuel tank filler pipe hose clamp	4	-	35
Fuel tank filler pipe retaining screws	2	-	18
Fuel tank strap bolts	40	30	-
Inertia Fuel Shutoff (IFS) switch mounting bolt	2	-	18
LH rear parking brake cable assembly bracket bolts	23	17	-
Lower crossover support brace nuts	76	56	-

DESCRIPTION AND OPERATION

FUEL TANK AND LINES

The fuel system consists of:

- a Mechanical Returnless Fuel System (MRFS).
- an All-Wheel Drive (AWD) saddle-type or Front Wheel Drive (FWD) L-shaped fuel tank.
- fuel, vapor and brake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- a fuel tank filler pipe assembly, which cannot be modified in any way, that also contains a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- a one-fourth turn-type fuel tank filler cap.
- an Inertia Fuel Shutoff (IFS) switch.
- a Fuel Pump (FP) module containing:
  - an electric FP, which provides pressurized fuel to the fuel rail.
  - a fuel level sender.
  - a check valve, which maintains system pressure after the FP is shut off.
  - a pressure relief valve for overpressure protection in the event of restricted fuel flow.
  - an in-tank fuel filter providing filtration to protect the fuel injectors from foreign material.
- an individual fuel level sensor, AWD vehicles only.

The FP is controlled by the PCM. Electrical power to the FP is provided through the IFS switch located under the right front door scuff plate.

DIAGNOSTIC TESTS

FUEL TANK AND LINES

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

FUEL TANK AND FILLER PIPE - EXPLODED VIEW

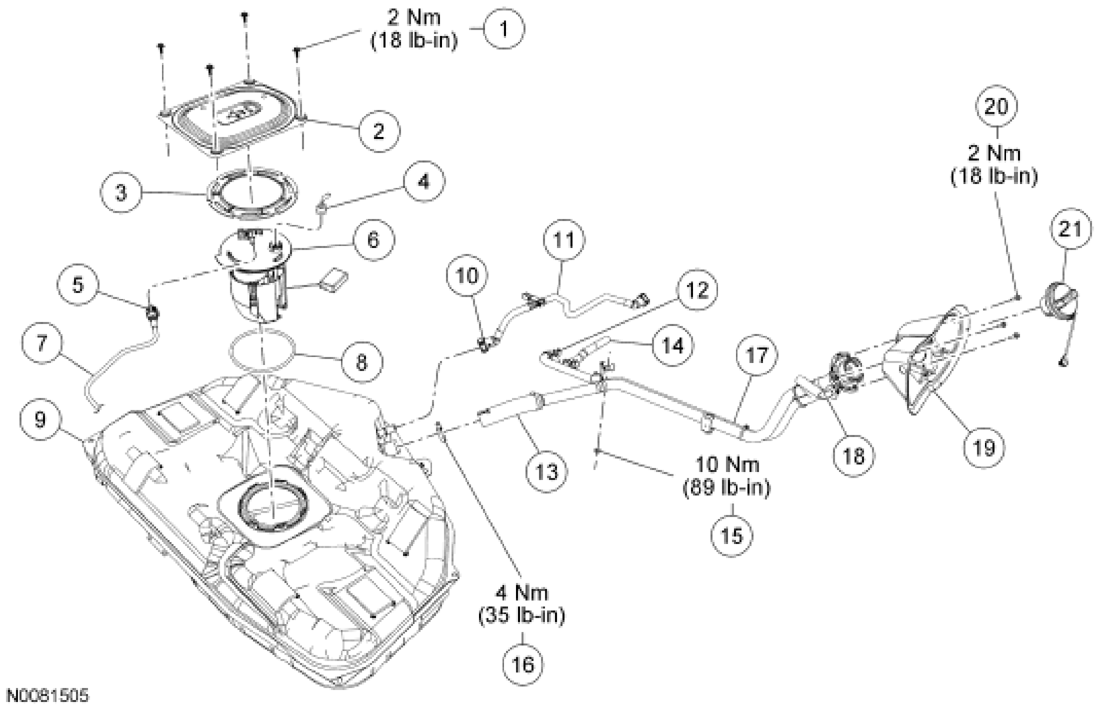

Fig. 1: Exploded View Of Fuel Tank & Filler Pipe With Torque Specifications - Front Wheel Drive (FWD) Vehicles (1 Of 2)

38	N807379	Splash shield rivet (3 required)

1. For additional information, refer to the procedures.

FUEL TANK - FRONT WHEEL DRIVE (FWD)

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the fuel tank. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

3. Remove the muffler and tailpipe. For additional information, refer to **EXHAUST SYSTEM** article.

NOTE: Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any remaining fuel into a suitable container.

4. Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.
   - To install, tighten to 4 Nm (35 lb-in).
5. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
6. Remove the 4 nuts, 2 clips and the fuel tank heat shield.
7. Install a suitable lifting device below the fuel tank.
8. Remove the 4 bolts and the 2 fuel tank straps.
   - To install, tighten to 40 Nm (30 lb-ft).
9. Carefully lower and remove the fuel tank from the vehicle.
10. To install, reverse the removal procedure.

FUEL TANK - ALL WHEEL DRIVE (AWD)

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working**

on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the fuel tank. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
3. Remove the muffler and tailpipe. For additional information, refer to **EXHAUST SYSTEM** article.
4. Remove the driveshaft. For additional information, refer to **DRIVESHAFT** article.
5. Position a suitable lifting device under the fuel tank.
6. Remove the 4 bolts and the 2 fuel tank straps.
   - To install, tighten to 40 Nm (30 lb-ft).
7. Partially lower the fuel tank enough to access the fuel tank filler pipe hose clamp.

NOTE: **Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any remaining fuel into a suitable container.**

8. Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.
   - To install, tighten to 4 Nm (35 lb-in).
9. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
10. Carefully lower and remove the fuel tank from the vehicle.
11. To install, reverse the removal procedure.

REMOVAL AND INSTALLATION

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Carefully turn the fuel tank filler cap counterclockwise approximately one-fourth turn until the thread disengages and position aside.

NOTE: When removing the Fuel Draining Hose, the fitting on the end of the hose can become detained by the safety valve. Carefully remove the hose using a gentle agitating motion to avoid detaching the hose from the fitting.

NOTE: The Fuel Draining Hose must be inserted into the fuel tank filler pipe until the fitting on the end of the hose enters into the fuel tank, opening the safety valve.

4. Insert the Fuel Draining Hose into the fuel tank filler pipe.

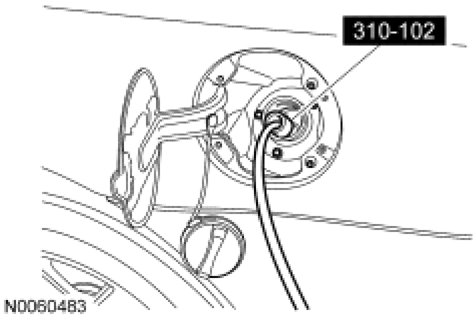

Fig. 5: Inserting Special Tool (310-102) Into Fuel Tank Filler Pipe
Courtesy of FORD MOTOR CO.

NOTE: **This step will remove approximately one-eighth tank of fuel from a completely full fuel tank and the majority of any residual fuel from the fuel tank filler pipe. Also, the fuel in the fuel tank will be below the fuel tank inlet for fuel tank filler pipe removal without fuel spillage.**

5. Attach the Fuel Storage Tanker to the Fuel Draining Hose and remove approximately one-eighth tank of fuel (from a completely full tank), lowering the fuel level below the fuel tank inlet.
6. Remove the 3 fuel tank filler pipe retaining screws.
7. Remove the LH rear wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
8. Remove the 3 rivets, 6 pin-type retainers and the LH wheel splash shield.
9. Remove the fresh air hose fitting from the fuel tank filler pipe housing.
10. Remove the 3 nuts and the fuel tank filler pipe heat shield.
    - To install, tighten to 9 Nm (80 lb-in).
11. Remove the fresh air hose from the dust separator.
12. Remove the fuel tank filler pipe bracket nut.
    - To install, tighten to 10 Nm (89 lb-in).
13. Release the 2 swivel clips.

NOTE: **Some fuel may remain in the fuel tank filler pipe after the initial drain. Carefully drain any residual fuel into a suitable container.**

14. Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.
    - To install, tighten to 4 Nm (35 lb-in).
15. Remove the fuel tank filler pipe assembly from the vehicle.
16. To install, reverse the removal procedure.

NOTE: **This step will remove approximately one-eighth tank of fuel from a completely full fuel tank and the majority of any residual fuel from the fuel tank filler pipe. Also, the fuel in the fuel tank will be below the fuel tank inlet for fuel tank filler pipe removal without fuel spillage.**

6. Attach the Fuel Storage Tanker to the Fuel Draining Hose and remove approximately one-eighth tank of fuel (from a completely full tank), lowering the fuel level below the fuel tank inlet.
7. Remove the 3 fuel tank filler pipe retaining screws.
8. Remove the LH rear wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
9. Remove the 3 rivets, 6 pin-type retainers and the LH wheel splash shield.
10. Remove the fresh air hose fitting from the fuel tank filler pipe housing.
11. Remove the 3 nuts and the fuel tank filler pipe heat shield.
    - To install, tighten to 9 Nm (80 lb-in).
12. Disconnect the fuel vapor tube assembly-to-recirculation tube quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
13. Remove the fresh air hose from the dust separator.

14. Remove the fuel tank filler pipe bracket retaining nut.
    - To install, tighten to 10 Nm (89 lb-in).
15. Release the 2 swivel clips.
16. Remove the 4 screws and the fuel tank filler pipe housing.
17. Loosen the LH fuel tank strap bolts.
    - To install, tighten to 40 Nm (30 lb-ft).
18. Partially lower the LH side of the fuel tank to allow access to the fuel tank filler hose and clamp.

NOTE: Some fuel may remain in the fuel tank filler pipe after the initial drain. Carefully drain any residual fuel into a suitable container.

19. Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.
    - To install, tighten to 4 Nm (35 lb-in).

NOTE: The fuel tank filler pipe assembly has to be directed upward and partially out of the fuel door opening, then it can be lowered and maneuvered out of the vehicle.

20. Remove the fuel tank filler pipe assembly from the vehicle.
21. To install, reverse the removal procedure.

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.**

All vehicles

1. Release the fuel system pressure. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Carefully turn the fuel tank filler cap counterclockwise approximately one-fourth turn until the thread disengages and position aside.

NOTE: When removing the Fuel Draining Hose, the fitting on the end of the hose can become detained by the safety valve. Carefully remove the hose using a gentle agitating motion to avoid detaching the hose from the fitting.

NOTE: The Fuel Draining Hose must be inserted into the fuel tank filler pipe until the fitting on the end of the hose enters into the fuel tank, opening the safety valve.

4. Insert the Fuel Draining Hose into the fuel tank filler pipe.

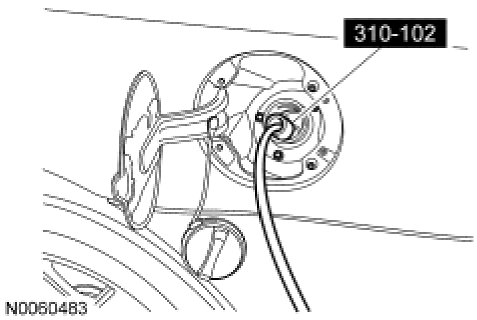

Fig. 7: Inserting Special Tool (310-102) Into Fuel Tank Filler Pipe
Courtesy of FORD MOTOR CO.

NOTE: This step will remove approximately one-eighth tank of fuel from a completely full fuel tank and the majority of any residual fuel from the fuel tank filler pipe. Also the fuel in the fuel tank will be below the Fuel Pump (FP) module mounting flange for FP module removal without fuel spillage.

5. Attach the Fuel Storage Tanker to the Fuel Draining Hose and remove approximately one-eighth tank of fuel (from a completely full tank), lowering the fuel level below the FP module mounting flange.
6. Remove the rear seat lower cushion. For additional information, refer to **SEATING** article.

Front Wheel Drive (FWD) vehicles

7. Remove the 4 screws and the FP module access cover.
   - To install, tighten to 2 Nm (18 lb-in).

All-Wheel Drive (AWD) vehicles

8. Remove the 3 screws and the FP module access cover.
   - To install, tighten to 2 Nm (18 lb-in).

All vehicles

9. Disconnect the FP module electrical connector.

10. Disconnect the fuel tube-to-FP module quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

NOTE:	**Place absorbent pads on the floor pan in the immediate area in case of fuel spills. Carefully remove the FP module from the vehicle to avoid fuel spillage inside the vehicle.**

NOTE:	**Make sure to install a new FP module O-ring seal and lock ring.**

11. Install the Fuel Tank Sender Unit Wrench. Remove and discard the FP module lock ring.

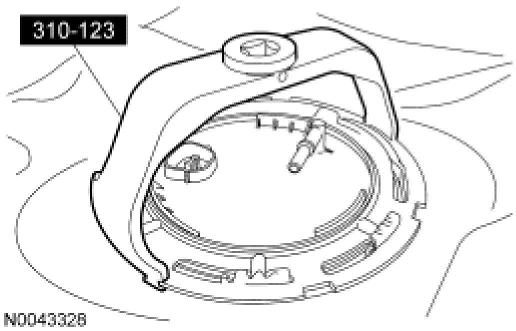

Fig. 8: Identifying Special Tool (310-123)
Courtesy of FORD MOTOR CO.

All-Wheel Drive (AWD) vehicles

12. Carefully lift the FP module out of the fuel tank enough to access and release the internal fuel tube-to-FP module quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

All vehicles

NOTE:	**The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

NOTE:	**The FP module will have residual fuel remaining internally, drain into a suitable container.**

13. Completely remove the FP module from the fuel tank.

NOTE:	**Inspect the mating surfaces of the FP module flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new FP module or fuel tank if the O-ring seal contact area is bent, scratched or corroded.**

NOTE: To install, apply clean engine oil to the new O-ring seal.

14. Remove and discard the FP module O-ring seal.
15. To install, reverse the removal procedure.
    - Make sure the alignment tab on the FP module and the fuel tank meet before tightening the FP module lock ring.

REMOVAL AND INSTALLATION

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

1. Release the fuel system pressure. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Carefully turn the fuel tank filler cap counterclockwise approximately one-fourth turn until the thread disengages and position aside.

NOTE: When removing the Fuel Draining Hose, the fitting on the end of the hose can become detained by the safety valve. Carefully remove the hose using a gentle agitating motion to avoid detaching the hose from the fitting.

NOTE: The Fuel Draining Hose must be inserted into the fuel tank filler pipe until the fitting on the end of the hose enters into the fuel tank, opening the safety valve.

4. Insert the Fuel Draining Hose into the fuel tank filler pipe.

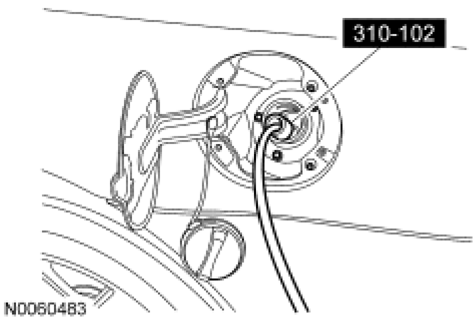

Fig. 9: Inserting Special Tool (310-102) Into Fuel Tank Filler Pipe
Courtesy of FORD MOTOR CO.

NOTE: This step will remove approximately one-eighth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe.

5. Attach the Fuel Storage Tanker to the Fuel Draining Hose and remove approximately one-eighth tank of fuel (from a completely full tank), lowering the fuel level below the fuel level sensor mounting flange.
6. Remove the rear seat lower cushion. For additional information, refer to **SEATING** article.
7. Remove the 3 screws and the fuel level sensor access cover.
   - To install, tighten to 2 Nm (18 lb-in).
8. Disconnect the fuel level sensor electrical connector.

NOTE: Place absorbent pads in the general work area in case of fuel spillage.

9. Release the lock tab, rotate the fuel level sensor counterclockwise approximately one-fourth turn and lift upward.

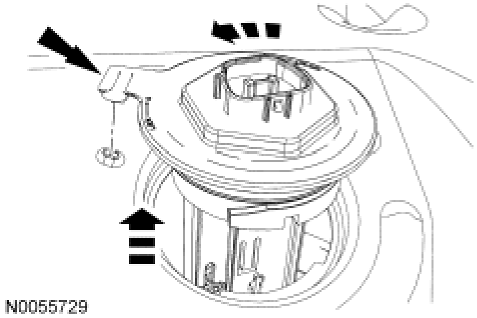

Fig. 10: Rotating Fuel Level Sensor Counterclockwise Approximately 1/4 Turn & Lift Upward
Courtesy of FORD MOTOR CO.

NOTE: The fuel level sensor must be handled carefully to avoid damage to the float arm.

NOTE: Carefully remove the fuel level sensor from the fuel tank to avoid fuel spillage inside the vehicle.

10. Carefully lift and remove the fuel level sensor from the fuel tank.

NOTE: Inspect the mating surfaces of the fuel level sensor flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new fuel level sensor or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

NOTE: Make sure to install a new fuel level sensor O-ring seal.

NOTE: To install, apply clean engine oil to the new O-ring seal.

11. Remove and discard the fuel level sensor O-ring seal.

12. To install, reverse the removal procedure.
    - Make sure the fuel level sensor locking tab is correctly positioned.

REMOVAL AND INSTALLATION

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Release the fuel system pressure. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
3. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

3.0L and 3.5L vehicles

4. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.

NOTE:	**The lower cowl panel must be removed to access the fuel and vapor tube quick connect couplings.**

5. Remove the lower cowl panel. For additional information, refer to the Cowl Panel Grille procedure in **FRONT END BODY PANELS** article.

All vehicles

NOTE:	**Some residual fuel may remain in the fuel tubes after releasing the fuel system pressure. When disconnecting or removing any fuel tubes, carefully drain any residual fuel into a suitable container.**

6. Disconnect the fuel jumper tube-to-fuel tube quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
7. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
8. Remove the 4 nuts and the lower crossover support brace.
   - To install, tighten to 76 Nm (56 lb-ft).
9. Remove the fuel tank. For additional information, refer to **Fuel Tank - Front Wheel Drive (FWD)**.

NOTE:	**The front parking brake cable bolt also retains a stone shield. Position the cable and shield aside.**

10. Remove the 2 bolts and position the LH rear parking brake cable assembly aside.
    - To install, tighten to 23 Nm (17 lb-ft).

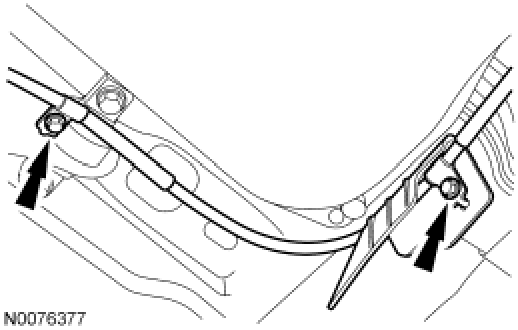

Fig. 12: Locating Bolts On LH Rear Parking Brake Cable Assembly Aside
Courtesy of FORD MOTOR CO.

11. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
12. Release the fuel tube bundle retaining clips and remove the fuel and vapor tubes.
13. Disconnect the vapor jumper tube-to-Evaporative Emission (EVAP) canister quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
14. Release the fuel bundle retaining clips and remove the vapor jumper tube.
15. To install, reverse the removal procedure.

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	9341	Inertia Fuel Shutoff (IFS) switch
2	W504148	IFS bolt (2 required)
3	14489A	IFS switch electrical connector
4	5413200	RH front door scuff plate

REMOVAL AND INSTALLATION

1. Remove the RH front door scuff plate.
2. Disconnect the Inertia Fuel Shutoff (IFS) switch electrical connector.

NOTE: Do not overtighten the fasteners or damage to the switch will occur.

3. Remove the 2 bolts and the IFS switch.
    - To install, tighten to 2 Nm (18 lb-in).
4. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

GENERATOR

The charging system consists of the following components:

- Generator
- Integral voltage regulator

The generator is belt-driven by the engine accessory drive system. The generator has an internal voltage regulator that is not replaced separately. The generator and voltage regulator are repaired as an assembly.

DIAGNOSTIC TESTS

GENERATOR

Refer to **CHARGING SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

GENERATOR - 2.3L

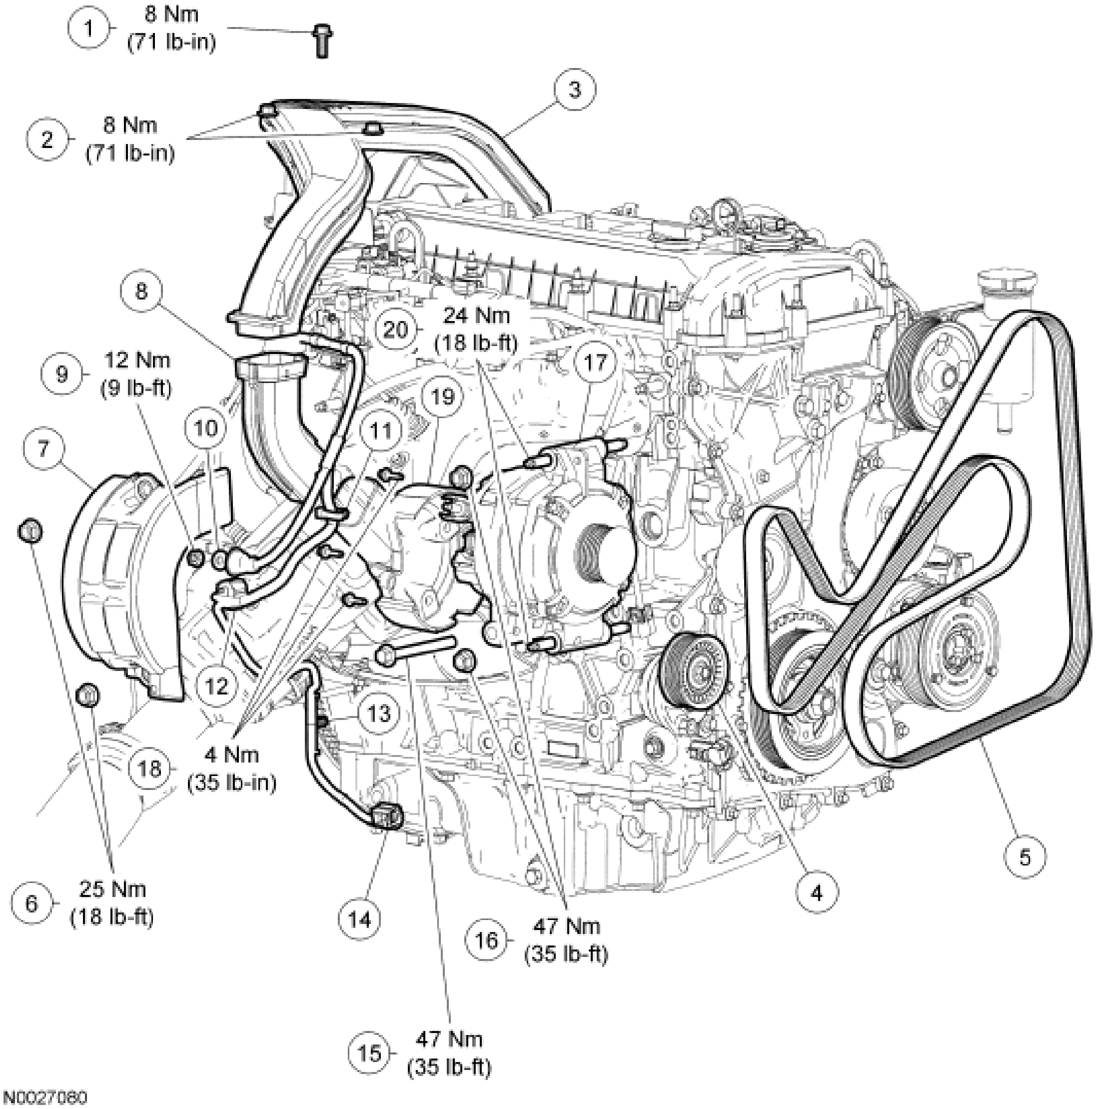

Fig. 1: Exploded View Of Generator With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Generator upper air duct bolt
2	W707944	Generator upper air duct nuts (2 required)
3	10C392	Generator upper air duct
4	6A228	Front end accessory drive (FEAD) belt tensioner
5	6C301	FEAD belt
6	W520414	Generator shield nuts (2 required)
7	10A346	Generator shield
8	10C392	Generator intermediate air duct
9	W706414	Generator B+ terminal nut
10	-	Generator B+ terminal (part of 14B060)

11	-	Generator harness locator (part of 12B637)
12	-	Generator electrical connector (part of 12B637)
13	-	Generator harness locator (part of 12B637)
14	-	Crankshaft position (CKP) electrical connector (part of 12B637)
15	W500131	Generator bolt
16	W520414	Generator nuts (2 required)
17	10300	Generator
18	W503254	Generator lower air duct bolts (3 required)
19	10C392	Generator lower air duct
20	W712013	Generator stud bolts (2 required)

REMOVAL AND INSTALLATION

1. Disconnect the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Remove the bolt, the 2 nuts and the generator upper air duct.
    - To install, tighten to 8 Nm (71 lb-in).
3. Rotate the front end accessory drive (FEAD) belt tensioner clockwise and position the accessory drive belt aside.
4. Remove the 2 nuts and the generator shield.
    - To install, tighten to 25 Nm (18 lb-ft).
5. Press the locking tabs and remove the generator intermediate air duct.
6. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (9 lb-ft).
7. Release the generator harness locator from the generator.
8. Disconnect the generator electrical connector.
9. Release the generator harness locator from the engine block.
10. Disconnect the crankshaft position (CKP) sensor connector and position the generator harness aside.
11. Remove the bolt, 2 nuts and the generator.
    - To install, tighten to 47 Nm (35 lb-ft).
12. If necessary, remove the 3 bolts and the generator lower air duct.
    - To install, tighten to 4 Nm (35 lb-in).
13. If necessary, remove the 2 generator stud bolts.
    - To install, tighten to 24 Nm (18 lb-ft).
14. To install, reverse the removal procedure.

GENERATOR - 3.0L

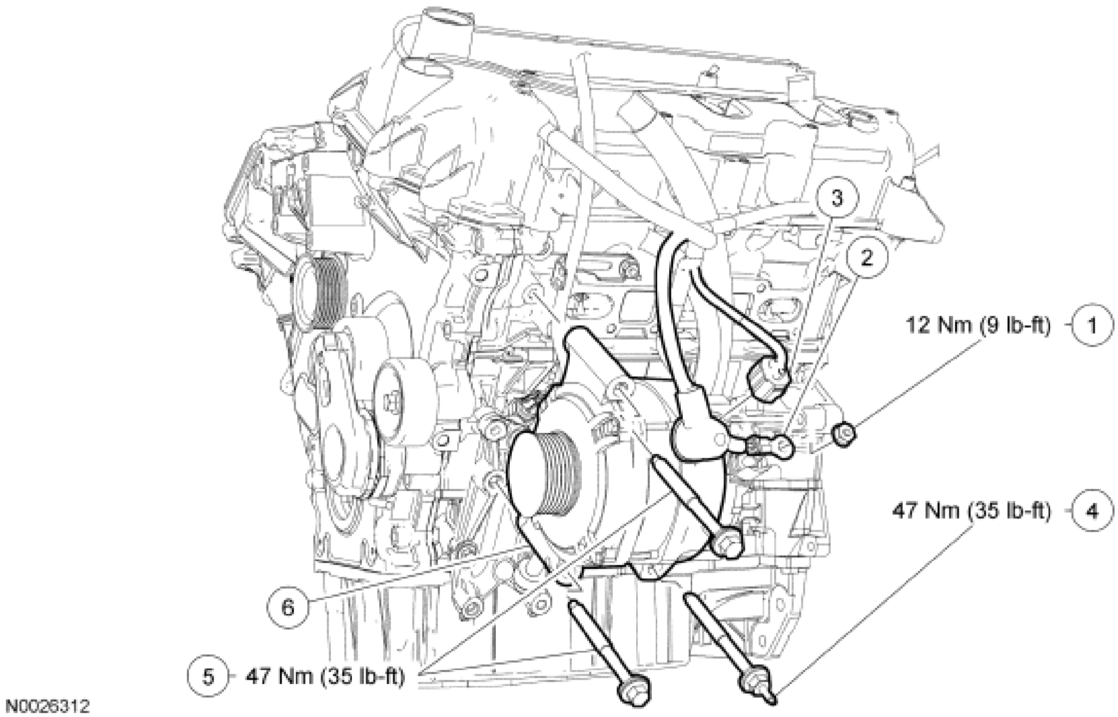

Fig. 2: Exploded View Of Generator With Torque Specifications - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706414	Generator B+ terminal nut
2	-	Generator B+ terminal (part of 14B060)
3	-	Generator electrical connector (part of 12B637)
4	W707669	Generator stud bolt
5	W704747	Generator bolts (2 required)
6	10300	Generator

REMOVAL AND INSTALLATION

1. Remove the A/C compressor. For additional information, refer to **CLIMATE CONTROL** article.
2. Disconnect the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (9 lb-ft).
4. Disconnect the generator electrical connector.
5. Remove the 3 bolts and the generator.
    - To install, tighten to 47 Nm (35 lb-ft).
6. To install, reverse the removal procedure.

GENERATOR - 3.5L

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	W712609	Generator stud
2	W520414	Generator nut
3	W709986	Generator bolt
4	W706414	Generator B+ terminal nut
5	10300	Generator
6	-	Generator electrical connector (part of 14B060)
7	-	Generator B+ terminal (part of 14B060)
8	-	Pin-type retainer, wiring harness

REMOVAL AND INSTALLATION

1. Remove the A/C compressor. For additional information, refer to **CLIMATE CONTROL** article.
2. Disconnect the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (9 lb-ft).
4. Disconnect the generator electrical connector.
    - Detach the pin-type retainer and wiring harness.
5. Remove the oil filter.
    - Lubricate the oil filter seal with clean engine oil before installation.
6. Position the engine wiring harness aside.
7. Remove the generator stud nut.
    - To install, tighten to 47 Nm (35 lb-ft).
8. Remove the generator bolt and the generator.
9. To install, reverse the removal procedure.

Rear door module bolts	11	97
Rear window glass clamp bolt	6	53

DESCRIPTION AND OPERATION

GLASS, FRAMES AND MECHANISMS

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

The glass, frames and mechanisms consist of:

- window regulators.
- door window regulator motors.
- front door glass top run.
- front door window glass.
- rear door window glass.
- rear window glass.
- rear fixed window glass.
- rear window regulator and motor - run and brackets.
- window control switches.
- accessory delay relay.
- SJB.
- windshield glass.
- heated rear window grid.
- heated rear window grid relay.

The glass, frames and mechanisms include:

- standard plastic and laminate safety glass.
- windshield glass which is bonded to the opening flange with a urethane sealant.
- standard power windows which include one-touch up, one-touch down and lock-out feature (left front only).

The window regulator control switch:

- is located on each door trim panel.
- may be used to manually raise or lower all windows from the left front window control switch or the individual side window from the corresponding individual door switch.
- for Fusion and Milan, can lock out passenger front and rear window control switches when the lock-out switch on the left front window control switch is turned on.
- for MKZ, can lock out rear window control switches when the lock-out switch on the left front window control switch is turned on.
- can manually lower the driver side window when the left front window control switch is pressed and held in the DOWN position.

- can automatically lower the driver side window when the left front window control switch is momentarily pressed to the DOWN position and released.

Global Open - MKZ Only

The SJB sends a signal on the global open circuit, to both front door window motors and the roof opening panel motor, to open or close the windows based on a signal received from the remote keyless entry (RKE) transmitter. If the accessory delay relay is active, the global open feature will not operate.

DIAGNOSTIC TESTS

GLASS, FRAMES AND MECHANISMS

Special Tools

Illustration	Tool Name	Tool Number

 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

LH and RH Front Power Window Control - MKZ

The LH and RH front window motors contain integral electronics which must be initialized whenever a new window motor has been installed. Initialization is required to learn both the full up and full down positions of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled. When mechanical repairs have been carried out on either front window regulator or glass run, the applicable front window motor must be de-initialized, and then initialized. Both the LH and RH front window control switches send 3 separate signals to the front window motors: up, down and auto. The front window control switches provide a 12-volt signal to the front window motor to request an up or down operation. When auto up or auto down is requested, the front window control switches provide a 12-volt signal on the up or down line and a ground signal on the auto line simultaneously. The up, down and auto feeds to the front window motors are all low current.

The LH and RH front window motors operate with the ignition switch in the RUN or ACCESSORY positions, or when the accessory delay relay is active. The high current required to move the front windows are supplied through the B+ and motor ground input.

When the LH or RH front window motor is operating in auto up or auto down mode, movement of the front

window can be stopped by pressing the switch to any position (UP, DOWN, AUTO up, AUTO down). The front window control switches must be released before the window will move again.

The LH and RH front window motors have a security override feature. If an obstacle has been detected in the window opening as the window glass is moving upward, the window motor will automatically reverse direction and move the glass toward the fully open position (in both manual up and one-touch up modes). This is known as "bounce-back". Once the window motor stops the glass at its bounce-back position, and within 2 seconds the switch is released then held in the AUTO up position, the window motor will move the glass up with no bounce-back protection (security override). If the switch is released before the window glass reaches the fully closed position, the window motor will stop with bounce-back automatically enabled for the next window up movement. If the ignition switch is turned to OFF or START (without delayed accessory), the window motor will stop. The only exception is when an obstacle is detected in the window opening while delayed accessory power is not present. In this case the window motor will bounce back, then stop. Ice, contaminant buildup and environmentally induced tight spots in the front window seals are all possible conditions that will activate the security override feature. If an obstruction occurs between 4 mm (0.15 in) and 200 mm (7.87 in) of window opening, the bounce-back position will be 250 mm (9.84 in) of window opening. If an obstruction occurs at a position greater than 200 mm (7.87 in) of window opening, the bounce-back position will be 50 mm (1.96 in) below where the obstruction occurred.

The LH and RH front window control switches have illumination and illumination ground inputs, which are used to illuminate the switch when the headlamp switch is turned to the PARK or ON position (the AUTOLAMP position may also energize this input). These switch inputs do not directly affect operation of the front windows. The front window control switches use the delayed accessory power input, which is transferred to the up or down outputs when the corresponding switch contact is closed. The front window control switches are grounded to the chassis through the main switch ground input, which is transferred to the auto output when the corresponding front window control switch contact is closed. If the delayed accessory feed to the front window control switch is missing, the window will not function. If the main ground signal is missing, the auto functions will be inoperative and the window will also be inoperative.

If there is an open in the LH or RH front window control switch or the associated wiring, the related function will become inoperative. If the up contact of the switch or the associated wiring develops an open circuit, the front window will only operate in the down direction, or in the one-touch down mode. If the down contact of the switch or the associated wiring develops an open circuit, the window will only operate in the up direction or in the one-touch up mode. If the auto contact of the switch or the associated wiring develops an open circuit, the window will only move proportionally up or down.

A new LH or RH front window motor will not operate in one-touch up mode and the bounce-back feature will be disabled prior to initialization. If the switch is actuated to the AUTO up or AUTO down position and released, window movement will stop when the up or down contact in the front window control switch is released. If the front window motor is removed from the window regulator drum housing, or if a new front window motor is installed, it must be initialized. Refer to **Window Motor Initialization**.

LH Front Power Window Control - Fusion and Milan

The one-touch down feature is controlled by the driver window control switch.

Passenger Window Operation

Passenger windows may be raised or lowered using the LH front window control switch or the corresponding passenger window control switch. Passenger window control switches receive power when the accessory delay relay is active and the LH front window lock switch is in the unlock position. For Fusion and Milan, when the LH front window lock switch is in the LOCK position, all passenger windows will not operate. For MKZ, when the LH front window lock switch is in the LOCK position, only the rear passenger windows will not operate.

Global Open

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

When the unlock button of the remote keyless entry (RKE) transmitter is held for 2 seconds, the global open activates. The SJB sends a signal to activate the one-touch down operation of both front windows. The global open feature does not operate if the delay accessory is active.

Delayed Accessory Power

The SJB activates the accessory delay relay whenever the ignition switch is in the RUN or the ACCESSORY position, or when the ignition switch is changed from RUN or ACCESSORY to the off/lock position and the LH and RH front doors are closed. When energized, the accessory delay relay supplies voltage to the power window system.

The SJB will deactivate the delayed accessory feature when:

- the LF door is ajar and the ignition switch is in the off/lock or key-out position.
- the RF door is ajar and the ignition switch is in the off/lock or key-out position.
- ten minutes have elapsed since the ignition switch was changed from ACC or RUN to the off/lock position.

Rear Window Defrost

The SJB controls power to the heated backlight by controlling the state of the heated backlight relay (integral to the SJB module). When the rear window defrost switch is pressed, the SJB will activate the heated backlight relay. When the heated backlight relay is active, the heated backlight will be energized.

The SJB will deactivate the heated backlight relay when one of the following conditions is met:

- The rear window defrost switch is pressed when the feature is active
- Ignition switch state is changed from RUN to OFF/LOCK
- The 17-minute timer completes

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Door window regulator and motor
• Door glass run
• Door window glass
	• Loose, corroded connectors
	• Circuitry
	• Window control switch
	• Battery junction box (BJB) fuses:
	  ○ 1 (60A)
	  ○ 6 (40A)
	  ○ 34 (30A)
	  ○ 35 (30A)
	• Smart junction box (SJB) fuses:
	  ○ 3 (15A)
	  ○ 8 (30A)
	  ○ 12 (7.5A) (MKZ only)
	• Accessory delay relay
	• Circuit breaker
	• Heated backlight grid

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the

smart junction box (SJB).

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1345	Heated Rear Window Input Circuit Short to Ground	Go to **Pinpoint Test J**.

Pinpoint Tests

Pinpoint Test A: All Power Windows are Inoperative - MKZ

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LH front power window control switch receives power through circuits CBP02 (GN) and CPW30 (GY/YE), which is the accessory delay relay output from the smart junction box (SJB). The accessory delay relay is integral to the SJB module. The LH and RH front power window motors each have their own separate power feeds and grounds and do not share any circuits with the LH or RH rear power window motors, except through the master window control switch.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- LH front window control switch
- SJB

PINPOINT TEST A: ALL POWER WINDOWS ARE INOPERATIVE - MKZ

A1 CHECK CIRCUITS CBP02 (GN) AND CPW30 (GY/YE) FOR VOLTAGE

- Disconnect: LH Front Window Control Switch C535A
- Disconnect: LH Front Window Control Switch C535B
- Key in ON position.

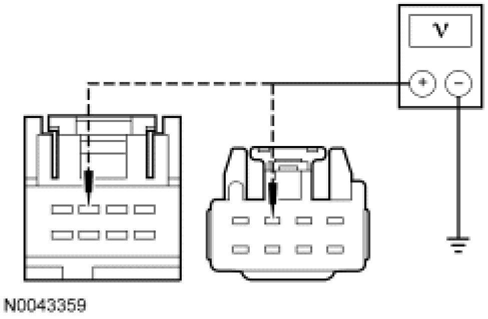

Fig. 1: Checking Circuit CBP02 (GN) And CPW30 (GY/YE) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window control switch C535A-3, circuit CBP02 (GN), harness side and ground; and between LH front window control switch C535B-3, circuit CPW30 (GY/YE), harness side and ground.
- **Is the voltage greater than 10 volts for both measurements?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : VERIFY SJB fuse 12 (7.5A) is OK. If OK, go to A2. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short.

A2 CHECK CIRCUITS CBP02 (GN) AND CPW30 (GY/YE) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280E

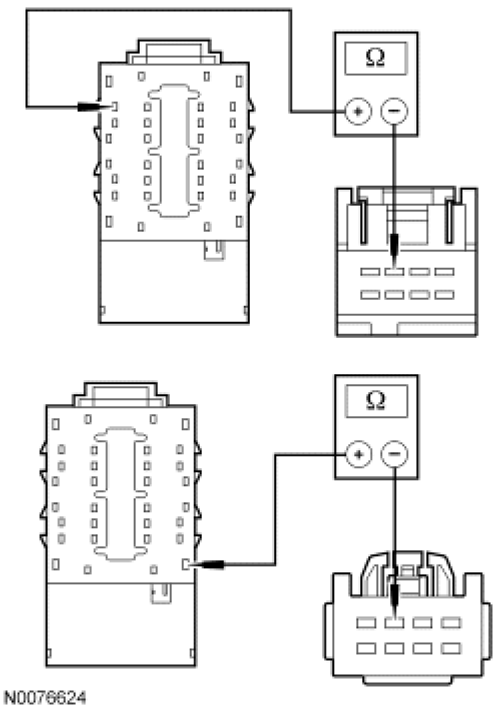

Fig. 2: Checking Circuit CBP02 (GN) And CPW30 (GY/YE) For Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535A-3, circuit CBP02 (GN), harness side and SJB C2280E-25, circuit CBP02 (GN), harness side; and between LH front window control switch C535B-3, circuit CPW30 (GY/YE), harness side and SJB C2280E-4, circuit CPW30 (GY/YE), harness side.
- **Are the resistances less than 5 ohms for both measurements?**

YES : Go to **Pinpoint Test L** to diagnose the accessory delay relay circuit.

NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test B: All Power Windows are Inoperative - Fusion, Milan

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LH front power window control switch receives power through circuit CPW30 (GY/YE), which is the accessory delay relay output from the smart junction box (SJB). The accessory delay relay is integral to the SJB module. The LH front power window control switch is grounded to the chassis through circuit CD126 (BK/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window control switch
- SJB

PINPOINT TEST B: ALL POWER WINDOWS ARE INOPERATIVE - FUSION, MILAN

B1 CHECK CIRCUIT CPW30 (GY/YE) FOR VOLTAGE

- Disconnect: LH Front Window Control Switch C504A
- Key in ON position.

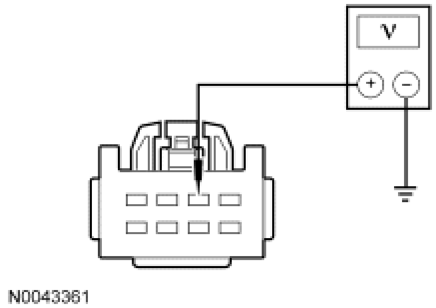

Fig. 3: Checking Circuit CPW30 (GY/YE) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window control switch C504A-2, circuit CPW30 (GY/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to B3.

  NO : Go to B2.

B2 CHECK CIRCUIT CPW30 (GY/YE) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280E

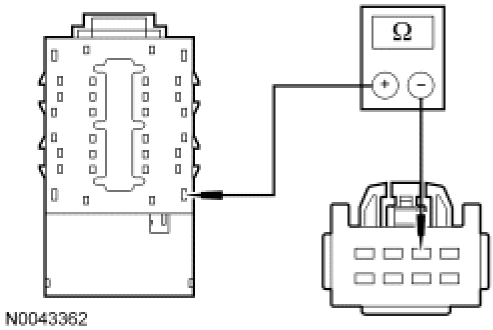

Fig. 4: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C504A-2, circuit CPW30 (GY/YE), harness side and SJB C2280E-4, circuit CPW30 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to **Pinpoint Test L** to diagnose the accessory delay relay circuit.

  NO : REPAIR the circuit. TEST the system for normal operation.

B3 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C504B

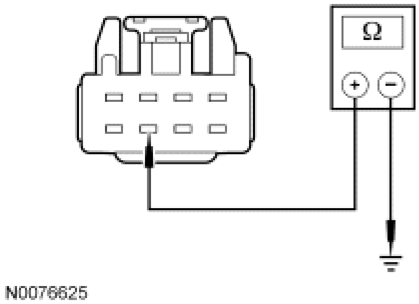

Fig. 5: Checking Circuit GD126 (BK/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C504B-7, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: A Single Power Window is Inoperative - MKZ, LH Front

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

NOTE:	**A new LH front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**

NOTE:	**The LH front power window motor must be initialized whenever a new motor is installed.**

NOTE:	**The LH front power window motor must be de-initialized, then initialized whenever the LH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

Normal Operation

Under normal operation, the LH front power window control switch receives power from the delay accessory relay through circuit CBP02 (GN). The LH window motor receives battery power through circuit SBB34 (YE/RD) at all times and ground through circuit GD126 (BK/WH). When the LH front window control switch is operated in the UP position, the LH front window motor receives a voltage signal through circuit CPW11 (BU/GY). When the LH front window control switch is operated in the DOWN position, the LH front window motor receives a voltage signal through circuit CPW10 (YE/VT). When the LH front window motor receives a ground signal on circuit CPW29 (VT/GY), the LH front window motor will enter one-touch up/down mode.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- LH front window motor
- LH front window control switch
- LH front window motor not initialized

PINPOINT TEST C: A SINGLE POWER WINDOW IS INOPERATIVE - MKZ, LH FRONT

C1 CHECK THE POWER TO THE WINDOW MOTOR

- Key in OFF position.
- Disconnect: LH Front Window Motor C540

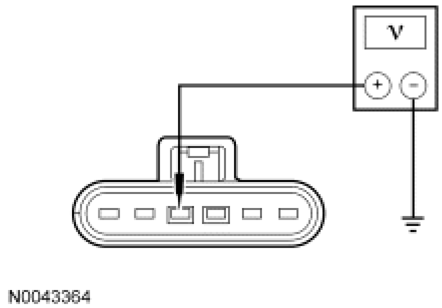

Fig. 6: Checking Power To Window Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window motor C540-4, circuit SBB34 (YE/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C2.

  NO : VERIFY battery junction box (BJB) fuse 34 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

C2 CHECK THE LH FRONT WINDOW MOTOR GROUND

- Key in OFF position.

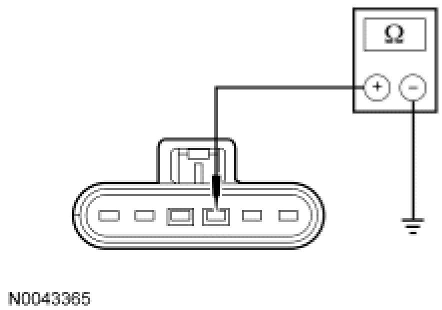

Fig. 7: Checking LH Front Window Motor Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-3, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C3.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

C3 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-LH FRONT WINDOW

MOTOR FEEDS

- Disconnect: LH Front Window Control Switch C535A

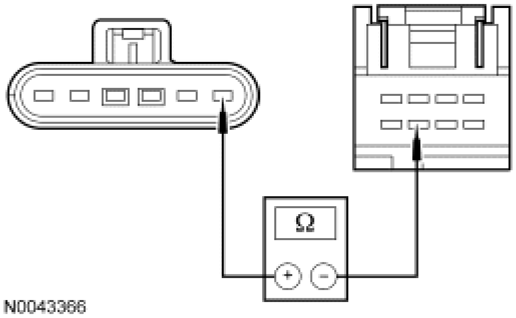

Fig. 8: Checking LH Front Window Control Switch-To-LH Front Window Motor Feeds (1 Of 3)
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-1, circuit CPW10 (YE/VT), harness side and LH front window control switch C535A-7, circuit CPW10 (YE/VT), harness side.

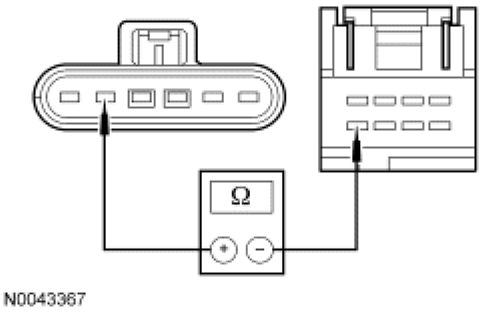

Fig. 9: Checking Circuit CPW29 (VT/GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-5, circuit CPW29 (VT/GY), harness side and LH front window control switch C535A-8, circuit CPW29 (VT/GY), harness side.

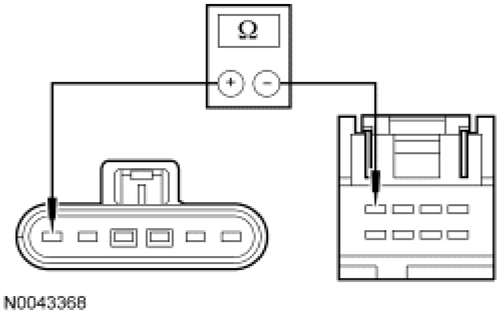

Fig. 10: Checking LH Front Window Control Switch-To-LH Front Window Motor Feeds (3 Of 3)

Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-6, circuit CPW11 (BU/GY), harness side and LH front window control switch C535A-4, circuit CPW11 (BU/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C4.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

C4 CHECK THE LH FRONT WINDOW CONTROL SWITCH

- Carry out the Master Window Adjust Switch Component Test. Refer to COMPONENT TESTING.
- **Did the window control switch pass the component test?**

  YES : INSTALL a new LH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

Pinpoint Test D: A Single Power Window is Inoperative - Fusion, Milan, LH Front

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LH front power window control switch receives power from the delay accessory relay through circuit CPW30 (GY/YE) and is grounded to chassis through circuit GD126 (BK/WH). When the LH front window control switch is operated in the UP position, the LH front window motor receives power through circuit CPW11 (BY/GY) and ground through circuit CPW10 (YE/VT). When the LH front window control switch is operated in the DOWN position, the LH front window motor receives power through circuit CPW10 (YE/VT) and ground through circuit CPW11 (BY/GY). The one-touch down feature is integral to the driver window control switch.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window motor
- LH front window control switch

PINPOINT TEST D: A SINGLE POWER WINDOW IS INOPERATIVE - FUSION, MILAN, LH FRONT

D1 CHECK THE LH FRONT POWER WINDOW MOTOR

- Disconnect: LH Front Window Control Switch C504A and C504B

- Key in ON position.

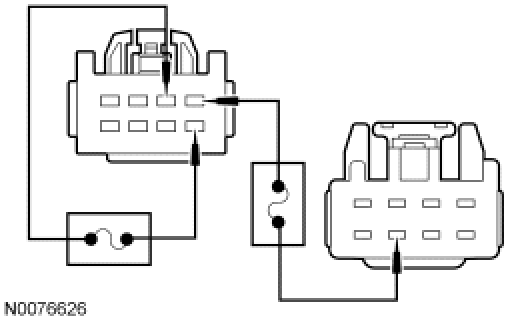

Fig. 11: Connecting Fused Jumper Wire Between LH Front Window Control Switch C504A-5 & C504A-2, CPW11 (BU/GY) & CPW30 (GY/YE)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between LH front window control switch C504A-5, circuit CPW11 (BU/GY), harness side and LH front window control switch C504A-2, circuit CPW30 (GY/YE), harness side. Connect a second fused jumper wire between LH front window control switch C504A-1, circuit CPW10 (YE/VT) and LH front window control switch C504B-7, circuit GD126 (BK/WH). The LH front window should operate in the up direction.

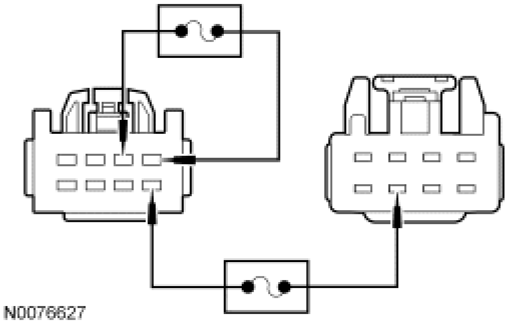

Fig. 12: Connecting Fused Jumper Wire Between LH Front Window Control Switch C504A-1 & C504A-2, CPW10 (YE/VT) & CPW30 (GY/YE)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between LH front window control switch C504A-1, circuit CPW10 (YE/VT), harness side and LH front window control switch C504A-2, circuit CPW30 (GY/YE), harness side. Connect a second fused jumper wire between LH front window control switch C504A-5, circuit CPW11 (BU/GY) and LH front window control switch C504B-7, circuit GD126 (BK/WH). The LH front window should operate in the down direction.
- **Does the LH front window operate correctly?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : Go to D2.

D2 CHECK FOR OPEN IN CIRCUIT CPW10 (YE/VT) OR CPW11 (BU/GY)

- Key in OFF position.
- Disconnect: LH Front Window Motor C518

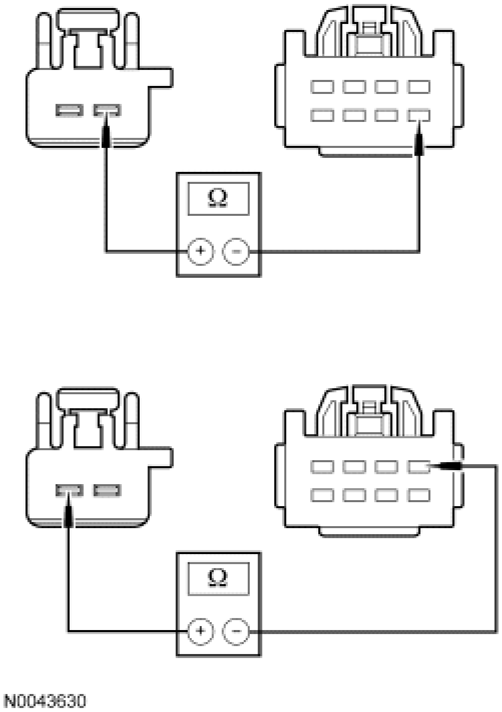

Fig. 13: Checking For Open In Circuit CPW10 (YE/VT) Or CPW11 (BU/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C518-1, circuit CPW11 (BU/GY), harness side and LH front window control switch C504A-5, circuit CPW11 (BU/GY), harness side; and between LH front window motor C518-2, circuit CPW10 (YE/VT), harness side and LH front window control switch C504A-1, circuit CPW10 (YE/VT), harness side.
- **Are the resistances less than 5 ohms for both measurements?**

  YES : INSTALL a new LH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test E: A Single Power Window is Inoperative - MKZ, RH Front

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

NOTE:	**A new RH front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**

NOTE: **The RH front power window motor must be initialized whenever a new motor is installed.**

NOTE: **The RH front power window motor must be de-initialized, then initialized whenever the RH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

Normal Operation

Under normal operation, the LH and RH front power window control switches receive power from the delay accessory relay through circuit CBP02 (GN). The RH window motor receives battery power through circuit SBB35 (BU/RD) at all times and ground through circuit GD139 (BK/YE). When the LH or RH front window control switch is operated in the UP position, the RH front window motor receives a voltage signal through circuit CPW13 (BN/YE). When the LH or RH front window control switch is operated in the DOWN position, the RH front window motor receives a voltage signal through circuit CPW12 (GN/OG). When the RH front window motor receives a ground signal on circuit CPW31 (GN/WH), the RH front window motor will enter one-touch up/down mode.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- RH front window motor
- LH or RH front window control switch
- RH front window motor not initialized

PINPOINT TEST E: A SINGLE POWER WINDOW IS INOPERATIVE - MKZ, RH FRONT

E1 CHECK THE LH FRONT WINDOW CONTROL SWITCH OPERATION

- Attempt to operate the RH window using the LH front power window control switch.
- **Does the RH window operate when using the LH front power window control switch?**

  YES : Go to E6.

  NO : Go to E2.

E2 CHECK THE POWER TO THE WINDOW MOTOR

- Key in OFF position.
- Disconnect: RH Front Window Motor C623

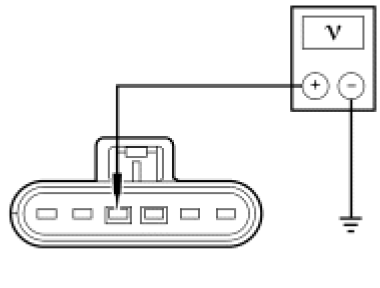

Fig. 14: Checking Power To Window Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between RH front window motor C623-4, circuit SBB35 (BU/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E3.

  NO : VERIFY BJB fuse 35 (30A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE then INITIALIZE the RH front window motor. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E3 CHECK THE RH FRONT WINDOW MOTOR GROUND

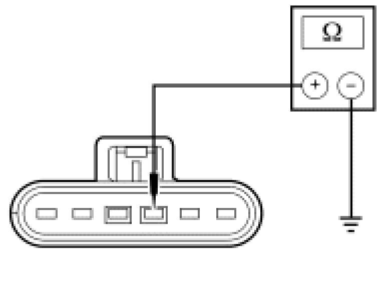

Fig. 15: Checking LH Front Window Motor Ground
Courtesy of FORD MOTOR CO.

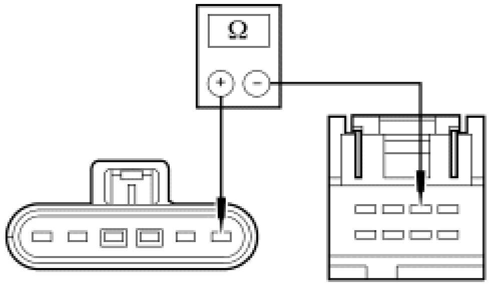
- Measure the resistance between RH front window motor C623-3, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E4.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E4 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-RH FRONT WINDOW MOTOR FEEDS

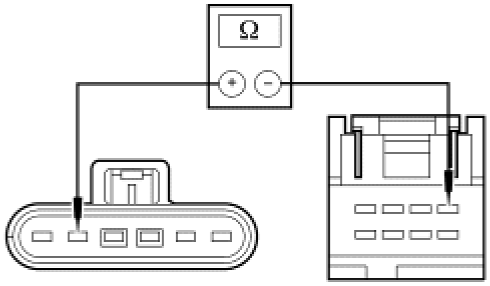
- Disconnect: LH Front Window Control Switch C535A



N0043631

Fig. 16: Checking LH Front Window Control Switch-To-RH Front Window Motor Feeds (1 Of 3)
Courtesy of FORD MOTOR CO.

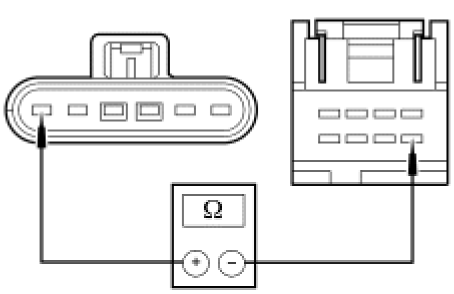
- Measure the resistance between RH front window motor C623-1, circuit CPW12 (GN/OG), harness side and LH front window control switch C535A-2, circuit CPW12 (GN/OG), harness side.



N0043632

Fig. 17: Checking LH Front Window Control Switch-To-RH Front Window Motor Feeds (2 Of 3)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window motor C623-5, circuit CPW31 (GN/WH), harness side and LH front window control switch C535A-1, circuit CPW31 (GN/WH), harness side.



N0043633

Fig. 18: Checking LH Front Window Control Switch-To-RH Front Window Motor Feeds (3

Of 3)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window motor C623-6, circuit CPW13 (BN/YE), harness side and LH front window control switch C535A-5, circuit CPW13 (BN/YE), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E5 CHECK THE LH FRONT WINDOW CONTROL SWITCH

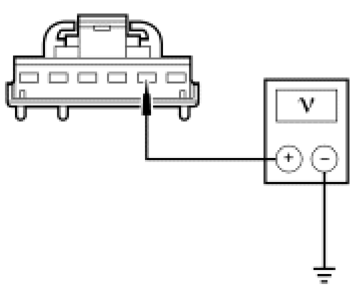
- Carry out the Master Window Adjust Switch Component Test. Refer to COMPONENT TESTING.
- **Did the window control switch pass the component test?**

  YES : INSTALL a new RH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E6 CHECK CIRCUIT CBP02 (GN) FOR VOLTAGE

- Disconnect: RH Front Window Control Switch C604
- Key in ON position.



N0043634

Fig. 19: Checking Circuit CBP02 (GN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between RH front window control switch C604-2, circuit CBP02 (GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

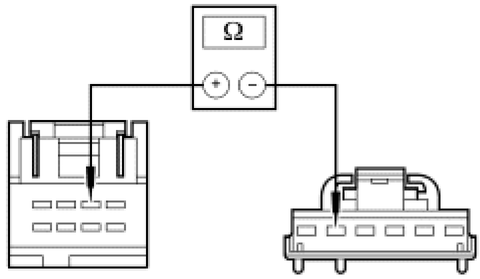
  YES : Go to E7.

  NO : REPAIR the circuit. TEST the system for normal operation.

E7 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-RH FRONT WINDOW CONTROL SWITCH CIRCUITS

- Key in OFF position.

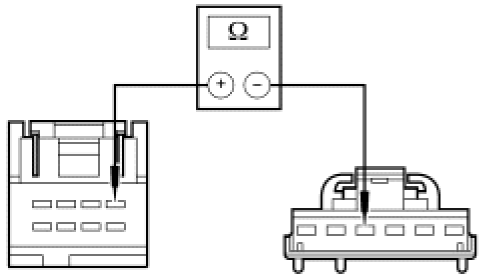
- Disconnect: LH Front Window Control Switch C535A



N0043635

Fig. 20: Checking LH Front Window Control Switch-To-RH Front Window Control Switch Circuits
Courtesy of FORD MOTOR CO.

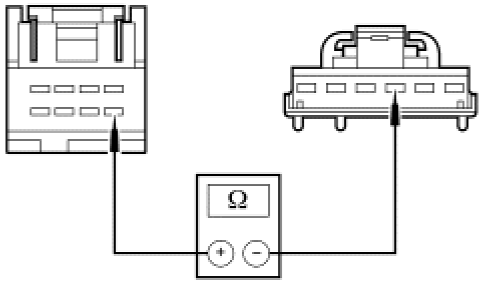
- Measure the resistance between RH front window control switch C604-5, circuit CPW12 (GN/OG), harness side and LH front window control switch C535A-2, circuit CPW12 (GN/OG), harness side.



N0043636

Fig. 21: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window control switch C604-4, circuit CPW31 (GN/WH), harness side and LH front window control switch C535A-1, circuit CPW31 (GN/WH), harness side.



N0043637

Fig. 22: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window control switch C604-3, circuit CPW13 (BN/YE), harness side and LH front window control switch C535A-5, circuit CPW13 (BN/YE), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new RH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test F: A Single Power Window is Inoperative - MKZ, LH or RH Rear

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

The LH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the unlock position, and the delayed accessory feature is active. When the LH rear window is operated in the up direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW21 (BN) and ground through circuit CPW22 (GN/VT). When the LH rear window is operated in the down direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW22 (GN/VT) and ground through circuit CPW21 (BN).

The RH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the unlock position, and the delayed accessory feature is active. When the RH rear window is operated in the up direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY). When the RH rear window is operated in the down direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT).

Rear Window Operation From LH Front Switch

When the LH rear power window is operated in the up direction from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW16 (BU/OG), which transfers power to the LH rear window motor through circuit CPW21 (BN). Ground is provided to the LH rear window switch through circuit CPW15 (YE), which transfers ground to the LH rear window motor through circuit CPW22 (GN/VT).

During LH rear power window down operation from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW15 (YE), which transfers power to the LH rear window motor through circuit CPW22 (GN/VT). Ground is provided to the LH rear window switch through circuit CPW16 (BU/OG), which transfers ground to the LH rear window motor through circuit CPW21 (BN).

When the RH rear power window is operated in the up direction from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW18 (GY/VT), which transfers power to the RH rear window motor through circuit CPW24 (WH/VT). Ground is sent to the RH rear window switch

through circuit CPW17 (BN/GN), which transfers ground to the RH rear window motor through circuit CPW23 (GY).

During RH rear power window down operation from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW17 (BN/GN), which transfers power to the RH rear window motor through circuit CPW23 (GY). Ground is sent to the RH rear window switch through circuit CPW18 (GY/VT), which transfers ground to the RH rear window motor through circuit CPW24 (WH/VT).

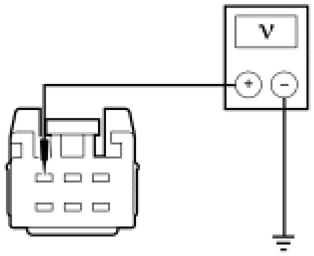
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window switch
- Rear window motor
- Rear window switch

PINPOINT TEST F: A SINGLE POWER WINDOW IS INOPERATIVE - MKZ, LH OR RH REAR

F1 CHECK THE VOLTAGE TO THE LH REAR OR RH REAR WINDOW CONTROL SWITCH

- Disconnect: Inoperative Rear Window Control Switch C701 (LH) or C819 (RH)
- Key in ON position.



N0043638

Fig. 23: Checking Voltage To LH Rear Or RH Rear Window Control Switch
Courtesy of FORD MOTOR CO.

NOTE: Set the LH front window lock switch to the UNLOCK position.

- Measure the voltage between the inoperative rear window connector and ground:
  - for the RH rear window control switch, measure the voltage between RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side and ground.
  - for the LH rear window control switch, measure the voltage between C701-3, circuit CPW14 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F4.

  NO : Go to F2.

F2 CHECK THE VOLTAGE TO THE LH FRONT WINDOW CONTROL SWITCH

- Disconnect: LH Front Window Control Switch C535B

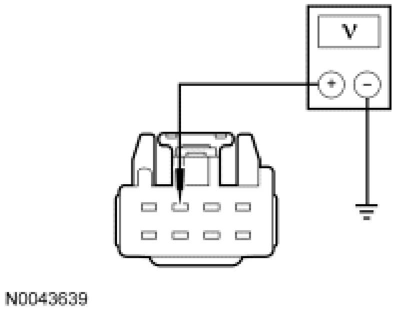


Fig. 24: Checking Voltage To LH Front Window Control Switch
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window control switch C535B-3, circuit CPW30 (GY/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F3.

  NO : REPAIR the circuit. TEST the system for normal operation.

F3 CHECK FOR OPEN IN CIRCUIT CPW14 (VT/WH)

- Key in OFF position.

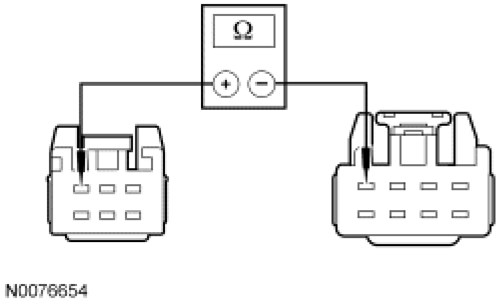

Fig. 25: Check For Open In Circuit CPW14 (VT/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative rear window connector and the LH front window control switch connector.
  - for the RH rear window control switch, measure the resistance between RH window control switch C819-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.
  - for the LH rear window control switch, measure the resistance between LH window control switch C701-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F4 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH

- Key in OFF position.

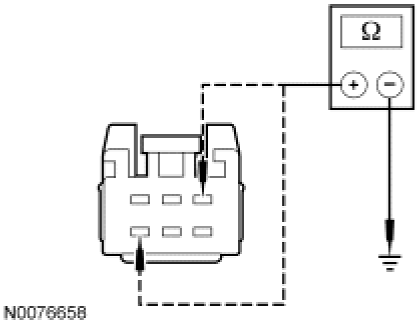

Fig. 26: Checking Grounds To Inoperative Rear Window Control Switch
Courtesy of FORD MOTOR CO.

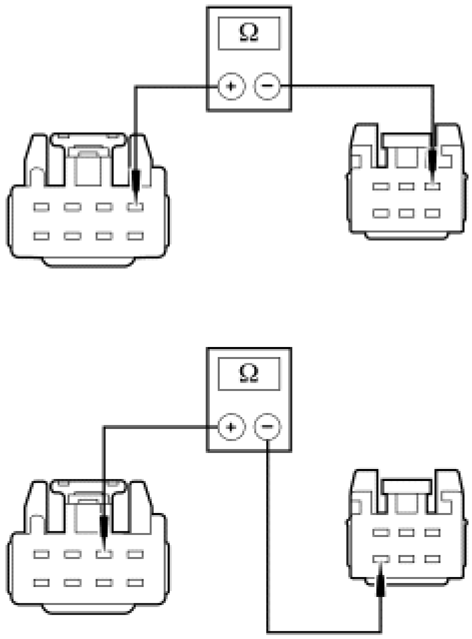
- Measure the resistance between the inoperative window control switch and ground:
  - for the RH rear window control switch, measure the resistance between RH rear window control switch C819-1, circuit CPW17 (BN/GN), harness side and ground; and between RH rear window control switch C819-6, circuit CPW18 (GY/VT), harness side and ground.
  - for the LH rear window control switch, measure the resistance between LH rear window control switch C701-1, circuit CPW15 (YE), harness side and ground; and between LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : Go to F7.

  NO : Go to F5.

F5 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN

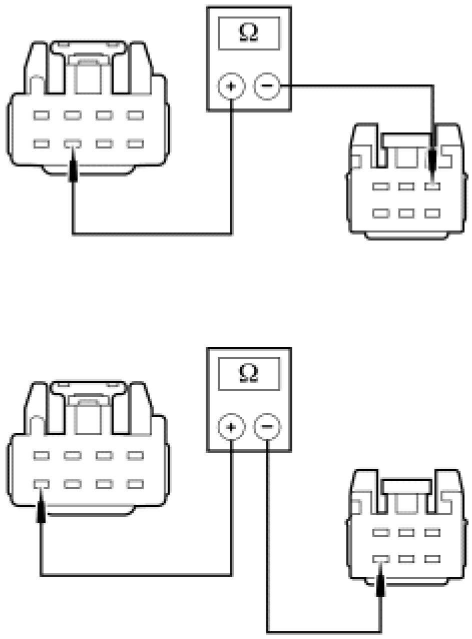
- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535B



N0076655

Fig. 27: Checking Circuits To Inoperative Rear Window Control Switch For An Open - Inoperative LH Rear Power Window
Courtesy of FORD MOTOR CO.

- For an inoperative LH rear power window, measure the resistance between LH front window control switch C535B-1, circuit CPW15 (YE) and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH front window control switch C535B-2, circuit CPW16 (BU/OG) and LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side.



N0076656

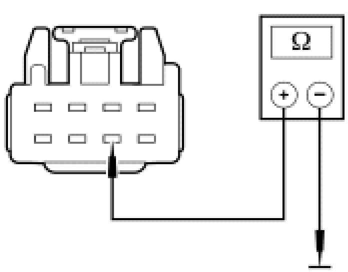
Fig. 28: Checking Circuits To Inoperative Rear Window Control Switch For An Open - Inoperative RH Rear Power Window
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear power window, measure the resistance between LH front window control switch C535B-7, circuit CPW17 (BN/GN) and RH window control switch C819-1, circuit CPW17 (BN/GN), harness side; and between LH front window control switch C535B-8, circuit CPW18 (GY/VT) and RH rear window control switch C819-6, circuit CPW18 (GY/VT), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to F6.

  NO : REPAIR the circuit(s) for an open. TEST the system for normal operation.

F6 CHECK THE GROUND TO THE LH FRONT WINDOW CONTROL SWITCH



N0076657

Fig. 29: Checking Ground To LH Front Window Control Switch
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535B-6, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F7 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH

- Connect: LH Front Window Control Switch C504B
- Key in ON position.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side. The LH rear window should operate in the downward direction.

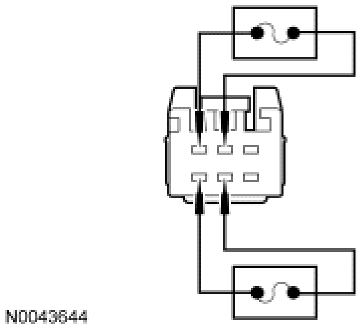


Fig. 30: Checking Inoperative Window Control Switch (1 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C819-2, circuit CPW23 (GY), harness side and RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side; and between RH rear window control switch C819-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C819-6, circuit CPW18 (GY/VT), harness side. The RH rear window should operate in the downward direction.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side. The LH rear window should operate in the upward direction.

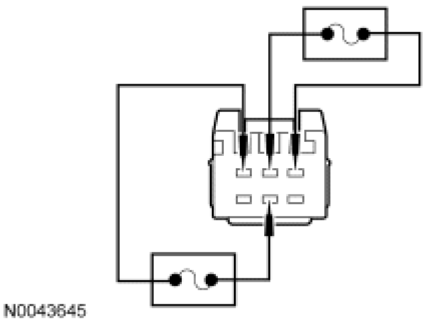

Fig. 31: Checking Inoperative Window Control Switch (2 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C819-2, circuit CPW22 (GN/VT), harness side and RH rear window control switch C819-1, circuit CPW17 (BN/GN), harness side; and between RH rear window control switch C819-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side. The RH rear window should operate in the upward direction.
- **Did the inoperative window operate correctly?**

  YES : INSTALL a new LH or RH rear window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : Go to F8.

F8 CHECK THE POWER WINDOW MOTOR CIRCUITS

- Key in OFF position.
- Disconnect: Inoperative Rear Window Motor C726 (LH) or C828 (RH)
- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window motor C726-2, circuit CPW22 (GN/VT), harness side.

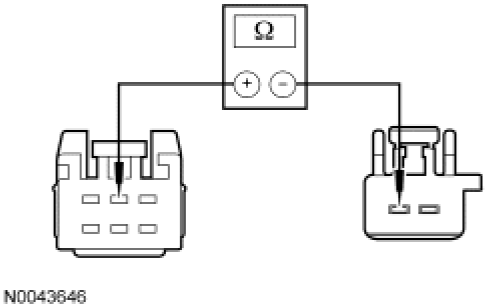

Fig. 32: Checking Power Window Motor Circuits (1 Of 2)
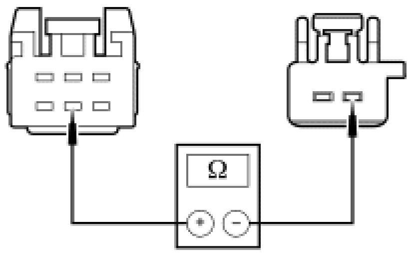
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C819-2, circuit CPW23 (GY), harness side and RH rear window motor C828-2, circuit CPW23 (GY), harness side.
- For an inoperative LH rear window, measure the resistance between LH rear window control

switch C701-5, circuit CPW21 (BN), harness side and LH rear window motor C726-1, circuit CPW21 (BN), harness side.



N0043647

Fig. 33: Checking Power Window Motor Circuits (2 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C819-5, circuit CPW24 (WH/VT), harness side and RH rear window motor C726-1, circuit CPW24 (WH/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH or RH rear window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test G: A Single Power Window is Inoperative- Fusion, Milan, RH Front, LH or RH Rear

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

The RH front window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory feature is active. When the RH front window is operated in the up direction from the RH front window control switch, power is sent to the RH front window motor through circuit CPW20 (YE/BK) and ground through circuit CPW19 (VT). When the RH front window is operated in the down direction from the RH front window control switch, power is sent to the RH front window motor through circuit CPW19 (VT) and ground through circuit CPW20 (YE/BK).

The LH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory feature is active. When the LH rear window is operated in the up direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW21 (BN) and ground through circuit CPW22 (GN/VT). When the LH rear window is operated in the down direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW22 (GN/VT) and ground through circuit CPW21 (BN).

The RH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory feature is active. When the RH rear window is operated in the up direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY). When the RH rear window is operated in the down direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT).

Window Operation From LH Front Switch

When the RH front power window is operated in the up direction from the LH front window control switch, power is sent to the RH front window control switch through circuit CPW13 (GY/RD), which transfers power to the RH front window motor through circuit CPW20 (YE/BK). Ground is provided to the RH front window switch through circuit CPW12 (GN/OG), which transfers ground to the RH front window motor through circuit CPW19 (VT).

During RH front power window down operation from the LH front window control switch, power is sent to the RH front window control switch through circuit CPW12 (GN/OG), which transfers power to the RH front window motor through circuit CPW19 (VT). Ground is provided to the RH front window switch through circuit CPW13 (GY/RD), which transfers ground to the RH front window motor through circuit CPW20 (YE/BK).

When the LH rear power window is operated in the up direction from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW16 (BU/OG), which transfers power to the LH rear window motor through circuit CPW21 (BN). Ground is provided to the LH rear window switch through circuit CPW15 (YE), which transfers ground to the LH rear window motor through circuit CPW22 (GN/VT).

During LH rear power window down operation from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW15 (YE), which transfers power to the LH rear window motor through circuit CPW22 (GN/VT). Ground is provided to the LH rear window switch through circuit CPW16 (BU/OG), which transfers ground to the LH rear window motor through circuit CPW21 (BN).

When the RH rear power window is operated in the up direction from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW18 (GY/VT), which transfers power to the RH rear window motor through circuit CPW24 (WH/VT). Ground is sent to the RH rear window switch through circuit CPW17 (BN/GN), which transfers ground to the RH rear window motor through circuit CPW23 (GY).

During RH rear power window down operation from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW17 (BN/GN), which transfers power to the RH rear window motor through circuit CPW23 (GY). Ground is sent to the RH rear window switch through circuit CPW18 (GY/VT), which transfers ground to the RH rear window motor through circuit CPW24 (WH/VT).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window switch

- RH front window switch
- Rear window motor
- Front window motor
- Rear window switch

PINPOINT TEST G: A SINGLE POWER WINDOW IS INOPERATIVE - FUSION, MILAN, RH FRONT, LH OR RH REAR

G1 CHECK THE VOLTAGE TO THE RH FRONT, LH REAR OR RH REAR WINDOW CONTROL SWITCH

- Disconnect: Inoperative Rear Window Control Switch C604 (RH front), C701 (LH rear) or C819 (RH rear)
- Key in ON position.

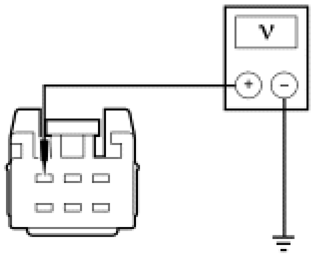


Fig. 34: Checking Voltage To RH Front, LH Rear Or RH Rear Window Control Switch
Courtesy of FORD MOTOR CO.

NOTE: Set the LH front window lock switch to the UNLOCK position.

- Measure the voltage between the inoperative rear window connector and ground:
  - for the RH front window control switch, measure the voltage between RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side and ground.
  - for the RH rear window control switch, measure the voltage between RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side and ground.
  - for the LH rear window control switch, measure the voltage between C701-3, circuit CPW14 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to G3.

  NO : Go to G2.

G2 CHECK FOR OPEN IN CIRCUIT CPW14 (VT/WH)

- Disconnect: LH Front Window Control Switch C504B
- Key in OFF position.

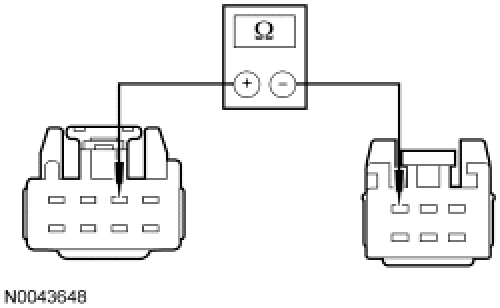

Fig. 35: Checking For Open In Circuit CPW14 (VT/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative rear window connector and the LH front window control switch connector:
  - for the RH front window control switch, measure the resistance between RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C504B-2, circuit CPW14 (VT/WH), harness side.
  - for the RH rear window control switch, measure the resistance between RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C504B-2, circuit CPW14 (VT/WH), harness side.
  - for the LH rear window control switch, measure the resistance between LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C504B-2, circuit CPW14 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

G3 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH

- Key in OFF position.

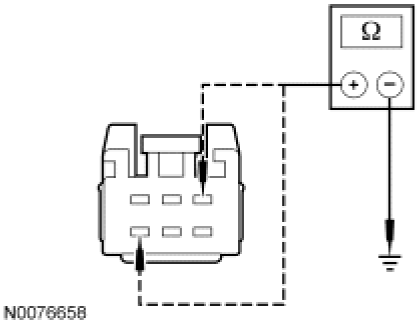

Fig. 36: Checking Grounds To Inoperative Rear Window Control Switch
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative window control switch and ground:

  - for the RH front window control switch, measure the resistance between RH front window control switch C604-1, circuit CPW12 (GN/OG), harness side and ground; and between RH front window control switch C604-6, circuit CPW13 (GY/RD), harness side and ground.
  - for the RH rear window control switch, measure the resistance between RH rear window control switch C819-1, circuit CPW17 (BN/GN), harness side and ground; and between RH rear window control switch C819-6, circuit CPW18 (GY/VT), harness side and ground.
  - for the LH rear window control switch, measure the resistance between LH rear window control switch C701-1, circuit CPW15 (YE), harness side and ground; and between LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : Go to G5.

  NO : Go to G4.

G4 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C504A and C504B

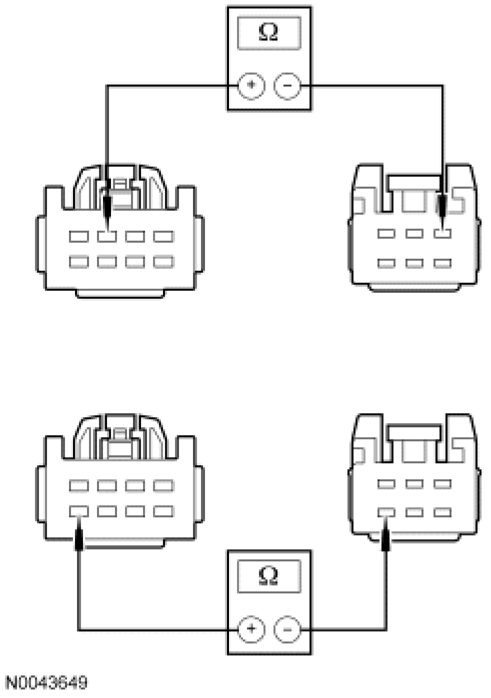

Fig. 37: Checking Circuits To Inoperative Rear Window Control Switch For An Open
Courtesy of FORD MOTOR CO.

- For an inoperative RH front power window, measure the resistance between LH front window control switch C504A-3, circuit CPW12 (GN/OG) and RH front window control switch C604-1, circuit CPW12 (GN/OG), harness side; and between LH front window control switch C504A-8, circuit CPW13 (GY/RD) and RH front window control switch C604-6, circuit CPW13 (GY/RD), harness side.

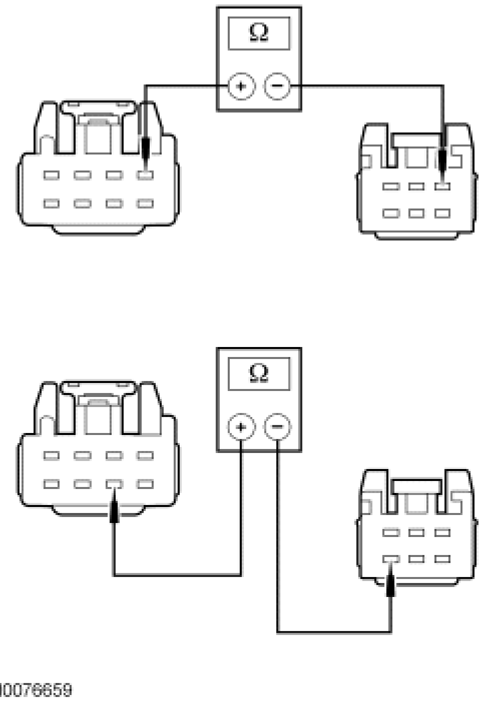

Fig. 38: Checking Circuits To Inoperative Rear Window Control Switch For An Open (2 Of 3)
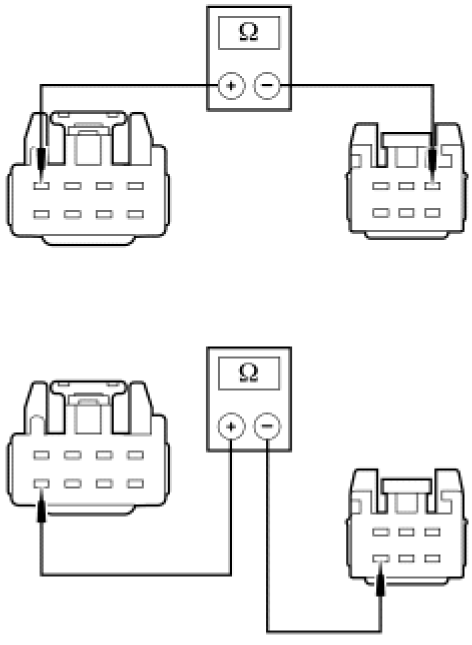
Courtesy of FORD MOTOR CO.

- For an inoperative LH rear power window, measure the resistance between LH front window control switch C504B-1, circuit CPW15 (YE) and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH front window control switch C504B-6, circuit CPW16 (BU/OG) and LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side.



N0076660

Fig. 39: Checking Circuits To Inoperative Rear Window Control Switch For An Open (3 Of 3)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear power window, measure the resistance between LH front window control switch C504B-4, circuit CPW17 (BN/GN) and RH window control switch C819-1, circuit CPW17 (BN/GN), harness side; and between LH front window control switch C504B-8, circuit CPW18 (GY/VT) and RH rear window control switch C819-6, circuit CPW18 (GY/VT), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit(s) for an open. TEST the system for normal operation.

G5 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH

- Key in ON position.
- For an inoperative RH front window, connect a fused jumper wire between RH front window control switch C604-2, circuit CPW19 (VT), harness side and RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side; and between RH front window control switch C604-5, circuit CPW20 (YE/BK), harness side and RH front window control switch C604-6, circuit CPW13 (GY/RD), harness side. The RH front window should operate in the downward direction.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side. The LH rear window should operate in the downward direction.

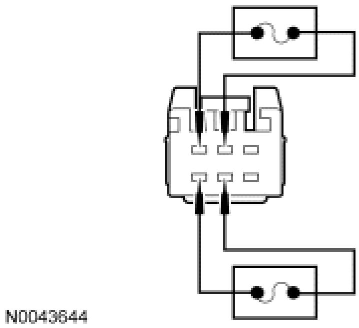


Fig. 40: Checking Inoperative Window Control Switch (1 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C819-2, circuit CPW23 (GY), harness side and RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side; and between RH rear window control switch C819-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C819-6, circuit CPW18 (GY/VT), harness side. The RH rear window should operate in the downward direction.
- For an inoperative RH front window, connect a fused jumper wire between RH front window control switch C604-2, circuit CPW19 (VT), harness side and RH front window control switch C604-1, circuit CPW12 (GN/OG), harness side; and between RH front window control switch C604-5, circuit CPW20 (YE/BK), harness side and RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side. The RH front window should operate in the upward direction.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side. The LH rear window should operate in the upward direction.

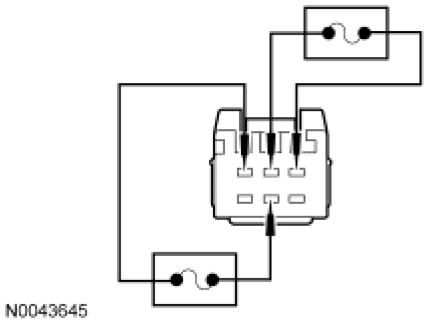

Fig. 41: Checking Inoperative Window Control Switch (2 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C819-2, circuit CPW22 (GN/VT), harness side and RH rear window control switch C819-1, circuit CPW17 (BN/GN), harness side; and between RH rear window control switch C819-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side. The RH rear window should operate in the upward direction.

- **Did the inoperative window operate correctly?**

  YES : INSTALL a new LH or RH rear window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : Go to G6.

G6 CHECK THE POWER WINDOW MOTOR CIRCUITS

- Key in OFF position.
- Disconnect: Inoperative Window Motor C608 (RH front), C726 (LH rear) or C828 (RH rear)
- For an inoperative RH front window, measure the resistance between RH front window control switch C604-2, circuit CPW19 (VT), harness side and RH front window motor C608-2, circuit CPW19 (VT), harness side.
- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window motor C726-2, circuit CPW22 (GN/VT), harness side.

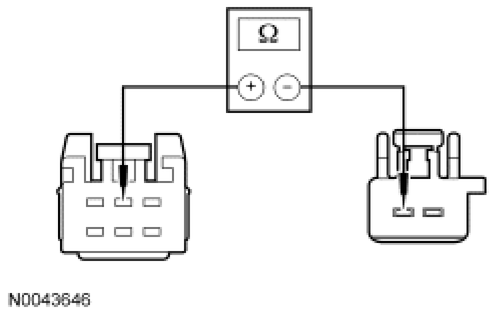

Fig. 42: Checking Power Window Motor Circuits (1 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C819-2, circuit CPW23 (GY), harness side and RH rear window motor C828-2, circuit CPW23 (GY), harness side.
- For an inoperative RH front window, measure the resistance between RH front window control switch C604-5, circuit CPW20 (YE/BK), harness side and RH front window motor C608-1, circuit CPW20 (YE/BK), harness side.
- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window motor C726-1, circuit CPW21 (BN), harness side.

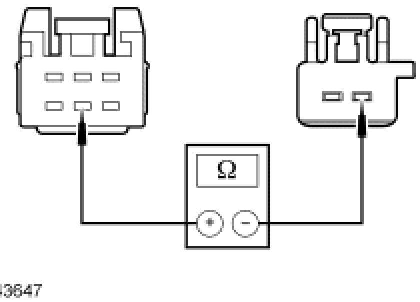

Fig. 43: Checking Power Window Motor Circuits (2 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C819-5, circuit CPW24 (WH/VT), harness side and RH rear window motor C726-1, circuit CPW24 (WH/VT), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new RH front, LH or RH rear window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test H: The One-Touch Up/Down Feature is Inoperative - MKZ, LH or RH Front

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

NOTE: **A new LH or RH front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**

NOTE: **The LH or RH front power window motor must be initialized whenever a new motor is installed.**

NOTE: **The LH or RH front power window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

Normal Operation

The LH front power window control switch receives power from the accessory delay relay through circuit CPB02 (GN) and is grounded through circuit GD126 (BK/WH). When the LH front window control switch is pressed to the UP position, the LH front motor receives power through circuit CPW11 (BU/GY). When the LH front window control switch is pressed to the DOWN position, the LH front motor receives power through circuit CPW10 (YE/VT). When the LF window motor receives a ground signal on circuit CPW29 (VT/GY), the

LF window motor will enter one-touch up or one-touch down.

The RH front power window control switch receives power from the accessory delay relay through circuit CPB02 (GN) and is grounded through circuit GD126 (BK/WH). When the RH front window control switch is pressed to the UP position, the RH front motor receives power through circuit CPW13 (BN/YE). When the RH front window control switch is pressed to the DOWN position, the RH front motor receives power through circuit CPW12 (GN/OG). When the RH window motor receives a ground signal on circuit CPW31 (GN/WH), the RH window motor will enter one-touch up or one-touch down.

This pinpoint test is intended to diagnose the following:

- B(+) power lost during LH or RH front window operation
- LH or RH front window motor
- LH or RH front window control switch
- LH or RH front motor not initialized
- Wiring, terminals or connectors

PINPOINT TEST H: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE - MKZ, LH OR RH FRONT

H1 CHECK FOR POWER (B+) LOSS DURING LH OR RH FRONT WINDOW OPERATION

- Verify if power (B+) was lost during LH or RH front window operation.
- **Was power (B+) lost while LH or RH front window was in operation?**

  YES : RAISE the LH or RH front window to the fully closed position. VERIFY the window glass stalls into the upper header seal. The front window should function normally. TEST the system for normal operation.

  NO : Go to H2.

H2 DE-INITIALIZE, THEN INITIALIZE THE FRONT MOTOR

- De-initialize the front window motor, then carry out the front window motor initialization procedure. Refer to **Window Motor Initialization**.
- **Is the one-touch down feature operating correctly?**

  YES : The system is operating normally at this time. The front window motor lost initialization.

  NO : For LH window, go to H3 .

  For RH window, go to H5 .

H3 CHECK THE LH FRONT WINDOW CONTROL SWITCH

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535A and C535B
- Carry out the Master Window Adjust Switch Component Test. Refer to COMPONENT TESTING.
- **Did the LH front window switch pass the component test?**

  YES : Go to H4.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

H4 CHECK CIRCUIT CPW29 (VT/GY) FOR AN OPEN

- Disconnect: LH Front Window Motor C540

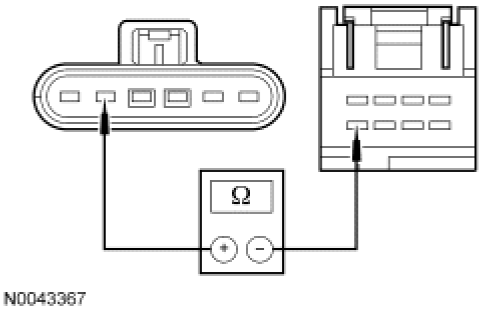

Fig. 44: Checking Circuit CPW29 (VT/GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535A-8, circuit CPW29 (VT/GY), harness side and LH front window motor connector C540-5, circuit CPW29 (VT/GY).
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

H5 CHECK THE LH and RH FRONT WINDOW CONTROL SWITCH

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535A, C535B and RH Front Window Control Switch C604
- Carry out the Master Window Adjust Switch Component Test and Window Adjust Switch, Passenger Side Component Test. Refer to COMPONENT TESTING.
- **Did the LH and RH front window switches pass the component tests?**

  YES : Go to H6.

  NO : INSTALL a new front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

H6 CHECK CIRCUIT CPW31 (GN/WH) FOR AN OPEN

- Disconnect: RH Front Window Motor C623

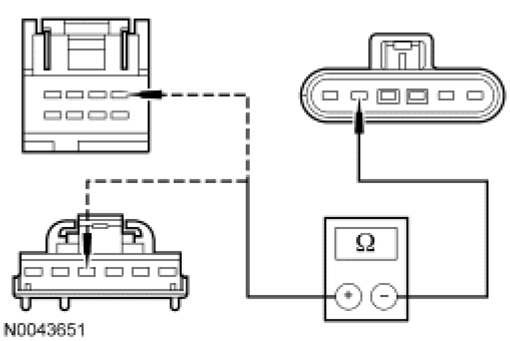

Fig. 45: Checking Circuit CPW31 (GN/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535A-1, circuit CPW31 (GN/WH), harness side and RH front window motor connector C623-5, circuit CPW31 (GN/WH); and between RH front window control switch C604-4, circuit CPW31 (GN/WH), harness side and RH front window motor connector C623-5, circuit CPW31 (GN/WH).
- **Are the resistances less than 5 ohms for both measurements?**

  YES : INSTALL a new RH front window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

Pinpoint Test I: The Global Open Function is Inoperative/Does Not Operate Correctly - MKZ

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

When the unlock button of the remote keyless entry (RKE) transmitter is held for 2 seconds the global open activates. The smart junction box (SJB) sends a signal on circuit CPW01 (BN/BU) to activate the one-touch down operation of both front windows.

The global open feature does not operate if the accessory delay relay is active.

- DTC B2947 Global Opening/Closing Circuit Open - Output is open or shorted to ground
- DTC B2949 Global Opening/Closing Circuit Short to Battery - Output is shorted to battery

This pinpoint test is intended to diagnose the following:

- RKE transmitters
- Wiring, terminals or connectors
- SJB
- Window motors not initialized

PINPOINT TEST I: THE GLOBAL OPEN FUNCTION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - MKZ

NOTE: **One-touch up/down must be operational for the global open function to operate correctly. Make sure one-touch up/down is operational before proceeding with this diagnostic.**

I1 CHECK THE DTCs

- Refer to the results from the previous SJB self-test.

- **Was DTC B2947 or B2949 retrieved?**

  YES : For B2949, go to I2 .

  For B2947, go to I5 .

  NO : Go to I7.

I2 CHECK CIRCUIT CPW01 (BN/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280C
- Key in ON position.

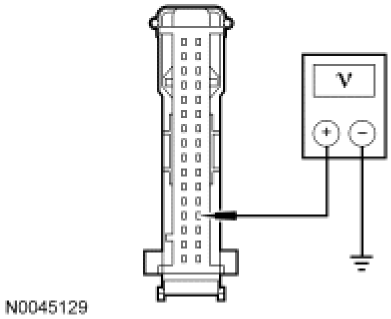

Fig. 46: Checking Circuit CPW01 (BN/BU) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280C-29, circuit CPW01 (BN/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to I3.

  NO : Go to I9.

I3 CHECK CIRCUIT CPW01 (BN/BU) FOR A SHORT TO VOLTAGE

- Disconnect: LH Front Window Motor C540

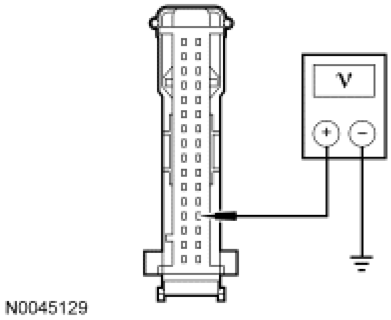

Fig. 47: Checking Circuit CPW01 (BN/BU) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280C-29, circuit CPW01 (BN/BU), harness side and ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to I4.

  NO : INSTALL a new LH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I4 CHECK CIRCUIT CPW01 (BN/BU) FOR A SHORT TO VOLTAGE

- Disconnect: RH Front Window Motor C623

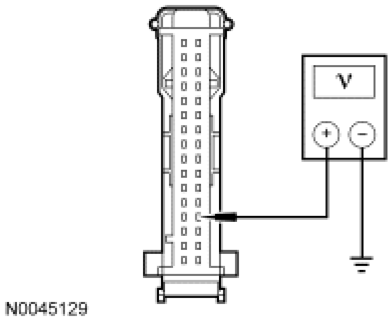

Fig. 48: Checking Circuit CPW01 (BN/BU) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280C-29, circuit CPW01 (BN/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the LH and RH front window motors. REFER to **Window Motor Initialization**. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : INSTALL a new RH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I5 CHECK CIRCUIT CPW01 (BN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280C
- Disconnect: LH Front Window Motor C540
- Disconnect: RH Front Window Motor C623

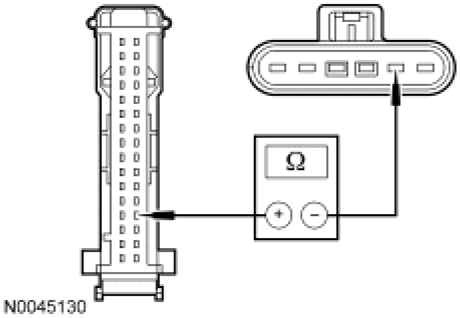

Fig. 49: Checking Circuit CPW01 (BN/BU) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280C-29, circuit CPW01 (BN/BU), harness side and LH front window motor C540-2, circuit CPW01 (BN/BU), harness side; and between SJB C2280C-29, circuit CPW01 (BN/BU), harness side and RH front window motor C604-2, circuit CPW01 (BN/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to I6.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the LH and RH front window motors. REFER to **Window Motor Initialization**. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I6 CHECK CIRCUIT CPW01 (BN/BU) FOR A SHORT TO GROUND

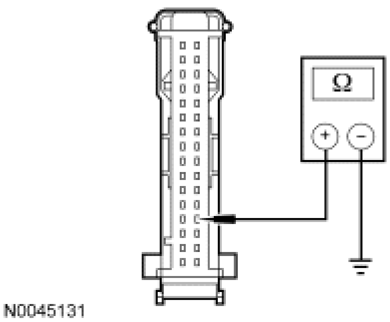

Fig. 50: Checking Circuit CPW01 (BN/BU) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280C-29, circuit CPW01 (BN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I9.

  NO : REPAIR the circuit. DE-INITIALIZE then INITIALIZE the LH and RH front window motors. REFER to **Window Motor Initialization**. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I7 CHECK THE RKE TRANSMITTER OPERATION

- Operate the RKE lock/unlock function using all of the RKE transmitters.
- **Does the RKE lock/unlock function operate correctly with at least one of the RKE transmitters?**

  YES : Go to I8.

  NO : REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article to continue diagnosis of the RKE system. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I8 CHECK THE RKE TRANSMITTERS GLOBAL OPEN OPERATION

- Operate the global open function using all of the RKE transmitters.
- **Does the global open function operate correctly with at least one of the RKE transmitters?**

  YES : PROVIDE new RKE transmitters. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. TEST the system for normal operation.

  NO : Go to I9.

I9 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all of the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all of the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test J: The Defrost System is Inoperative - MKZ

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Heated Window for schematic and connector information.

Normal Operation

The heated backlight relay, which is integral to the smart junction box (SJB), receives power from circuit SBB06 (BN/RD). When the rear window defrost switch is pressed on the HVAC, a message is sent to the SJB through circuit CH122 (WH/OG). Once the SJB receives the message to turn on the rear window defrost, the SJB grounds the heated backlight relay coil, which sends power through the antenna module to the rear window defrost grid through circuit CLS38 (VT/WH).

- DTC B1345 Heated Backlite Input Circuit Short To Ground - Switch input shorted to ground

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Inoperative SJB
- Antenna module
- HVAC

PINPOINT TEST J: THE DEFROST SYSTEM IS INOPERATIVE - MKZ

J1 CHECK THE DTCs

- Refer to the results from the previous SJB self-test.
- **Was DTC B1345 retrieved?**

  YES : Go to J2.

  NO : Go to J3.

J2 CHECK CIRCUIT CH122 (WH/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280D
- Disconnect: HVAC C2356A

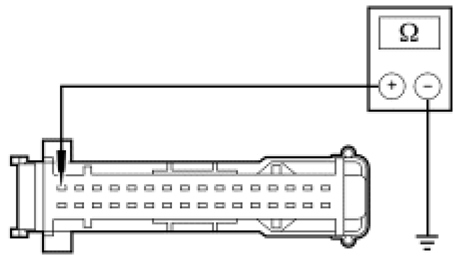

Fig. 51: Checking Circuit CH122 (WH/OG) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280D-16, circuit CH122 (WH/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new HVAC. REFER to **CLIMATE CONTROL** article. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

J3 CHECK THE SJB REAR DEFROST SWITCH REQUEST PID (RDEF_SW)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - SJB

- Monitor the SJB PID RDEF_SW while pressing the rear defrost switch.
- **Does the PID value agree with the rear defrost switch when pressed?**

  YES : Go to J5.

  NO : Go to J4.

J4 CHECK CIRCUIT CH122 (WH/OG) FOR AN OPEN CIRCUIT

- Key in OFF position.
- Disconnect: SJB C2280D
- Disconnect: HVAC C2356A

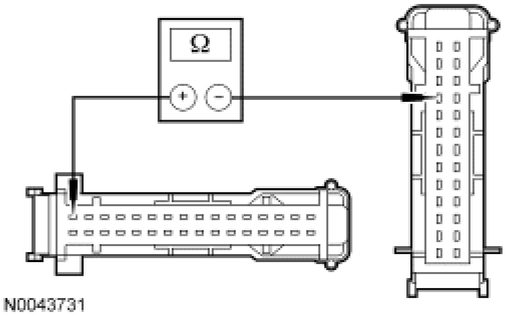

Fig. 52: Checking Circuit CH122 (WH/OG) For Open Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280D-16, circuit CH122 (WH/OG), harness side and HVAC C2356A-10, circuit CH122 (WH/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new HVAC. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

J5 CHECK THE SJB OUTPUT

- Turn the rear defroster ON. Measure the voltage across the rear window defrost grid terminals.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR the rear window defrost grid or INSTALL a new rear window glass. REFER to **Window Grid Wire Repair**, **Window Glass - Rear**. TEST the system for normal operation.

  NO : Go to J6.

J6 CHECK CIRCUIT CLS38 (VT/WH) VOLTAGE

- Key in OFF position.
- Connect: SJB C2280A
- Disconnect: Antenna module C4194B
- Key in ON position.
- Turn the rear defroster ON.

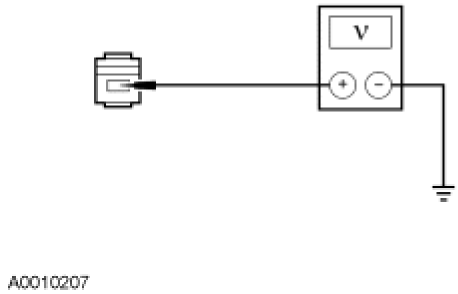

Fig. 53: Checking Circuit CLS38 (VT/WH) Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between antenna module C4194B-1, circuit CLS38 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSPECT antenna module jumper harness and rear window defrost grid ground circuit for damage and repair as necessary. If jumper harness and defrost grid ground wire are OK, INSTALL a new antenna module.

  NO : VERIFY SJB fuse 8 (30A) is OK. If OK, go to J7. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. TEST the system for normal operation.

J7 CHECK FOR POWER TO THE SJB HEATED BACKLIGHT CIRCUIT

- Key in OFF position.
- Disconnect: SJB C2280A

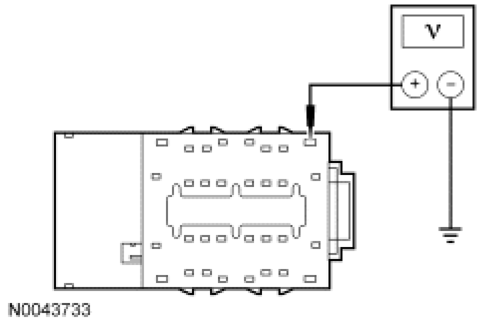

Fig. 54: Checking For Power To SJB Heated Backlight Circuit
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280A-29, circuit SBB06 (BN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J8.

  NO : VERIFY battery junction box (BJB) fuse 6 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING**

DIAGRAMS article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. TEST the system for normal operation.

J8 CHECK CIRCUIT CLS38 (VT/WH) FOR AN OPEN

- Disconnect: SJB C2280E
- Key in OFF position.

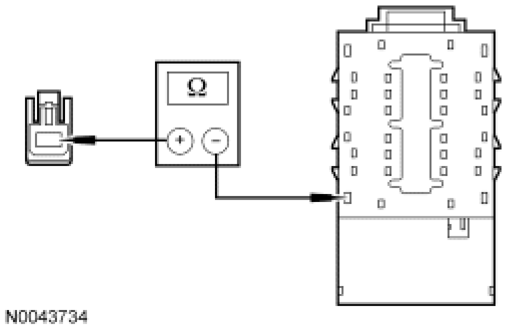

Fig. 55: Checking Circuit CLS38 (VT/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280E-1, circuit CLS38 (VT/WH), harness side and antenna module C4194B-1, circuit CLS38 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to J9.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

J9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for the removal and installation procedure. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: The Defrost System Will Not Shut Off Automatically - MKZ

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Heated Window for schematic and connector information.

Normal Operation

The heated backlight relay, which is integral to the smart junction box (SJB), receives power from circuit SBB06 (BN/RD). When the rear window defrost switch is pressed on the HVAC, a message is sent to the SJB through circuit CH122 (WH/OG). Once the SJB receives the message to turn on the rear window defrost, the SJB grounds the heated backlight relay coil, which sends power through the antenna module to the rear window defrost grid through circuit CLS38 (VT/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Antenna module
- SJB

PINPOINT TEST K: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY - MKZ

K1 CHECK CIRCUIT CLS38 (VT/WH) FOR SHORT TO VOLTAGE

- Disconnect: SJB C2280E
- Key in ON position.
- Measure the voltage across the rear window defrost grid terminals.
- **Is the voltage greater than 10 volts?**

  YES : Go to K2.

  NO : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for the removal and installation procedure. TEST the system for normal operation.

K2 CHECK CIRCUIT CLS38 (VT/WH) FOR SHORT TO VOLTAGE

- Disconnect: Antenna module C4194B
- Key in ON position.

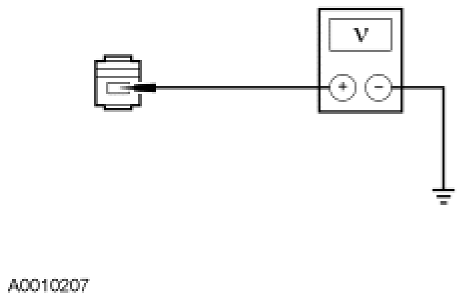

Fig. 56: Checking Circuit CLS38 (VT/WH) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between antenna module C4194B-1, circuit CLS38 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSPECT antenna module jumper harness for damage and repair as necessary. If jumper

harness is OK, INSTALL a new antenna module. TEST the system for normal operation.

NO : REPAIR the short to voltage in circuit CLS38 (VT/WH). TEST the system for normal operation.

Pinpoint Test L: The Delayed Accessory is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Windows for schematic and connector information.

Normal Operation

The accessory delay relay, which is integral to the smart junction box (SJB), receives power from the battery junction box (BJB) through circuit SBB01 (RD). When the ignition key is turned ON, the SJB activates the accessory delay relay, which provides power to the LH front window control switch through circuit CPW30 (GY/YE). The delayed accessory feature remains active for 10 minutes after the ignition key is turned OFF or until either front door is opened.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- SJB
- Door ajar switch(es)

PINPOINT TEST L: THE DELAYED ACCESSORY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

L1 CHECK FOR CORRECT OPERATION OF THE DOOR AJAR SWITCHES

- Open and close the front doors. Verify the interior lights turn on when the doors are open, and off when the doors are closed.
- **Do the interior lights operate normally?**

  YES : Go to L2.

  NO : VERIFY SJB fuse 3 (15A) and fuse 12 (7.5A) (MKZ only) are OK. If OK, REFER to **INTERIOR LIGHTING** article to diagnose the interior lighting and door ajar switches. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. TEST the system for normal operation.

L2 CHECK CIRCUIT SBB01 (RD) FOR VOLTAGE

- Disconnect: SJB C2280F
- Key in ON position.

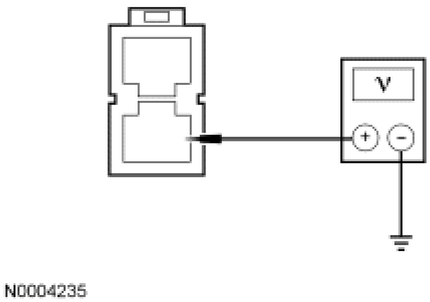

Fig. 57: Checking Circuit SBB01 (RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280F-2, circuit SBB01 (RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to L3.

  NO : VERIFY BJB fuse 1 (60A) is OK. If OK, REPAIR the circuit. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. TEST the system for normal operation.

L3 CHECK CIRCUIT CPW30 (GY/YE) FOR AN OPEN

- Disconnect: LH Front Window Control Switch C504A (Fusion, Milan) or C504B (MKZ)

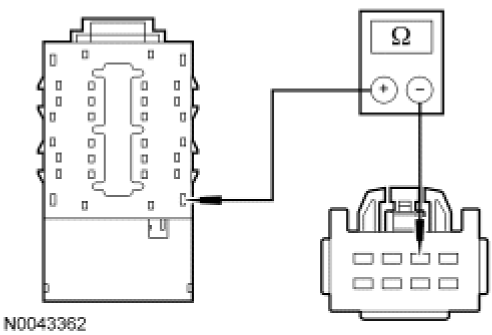

Fig. 58: Checking Circuit CPW30 (GY/YE) For An Open (Fusion Or Milan)
Courtesy of FORD MOTOR CO.

- For Fusion or Milan, measure the resistance between LH front window control switch C504A-2, circuit CPW30 (GY/YE), harness side and SJB C2280E-4, circuit CPW30 (GY/YE), harness side.

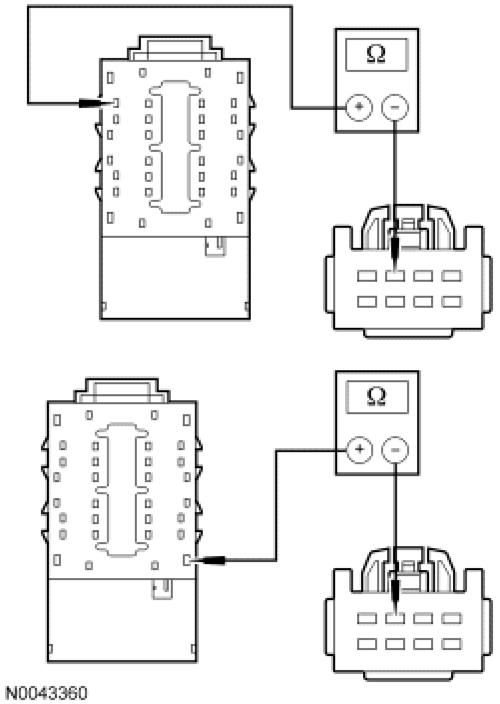

Fig. 59: Checking Circuit CPW30 (GY/YE) For An Open (MKZ)
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between LH front window control switch C504B-3, circuit CPW30 (GY/YE), harness side and SJB C2280E-4, circuit CPW30 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to L4.

  NO : REPAIR the circuit. TEST the system for normal operation.

L4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for the removal and installation procedure. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test M: The Defrost System is Inoperative - Fusion, Milan

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Heated Window for schematic and connector information.

Normal Operation

The heated backlight relay, which is integral to the smart junction box (SJB), receives power from circuit SBB06 (BN/RD). When the rear window defrost switch is pressed on the HVAC module - electronic automatic temperature control (EATC) or HVAC module- electronic manual temperature control module (EMTC), a message is sent to the SJB through circuit CH122 (WH/OG). Once the SJB receives the message to turn on the rear window defrost, the SJB grounds the heated backlight relay coil, which sends power to the rear window defrost grid through circuit CLS38 (VT/WH).

- DTC B1345 Heated Backlite Input Circuit Short To Ground - Switch input shorted to ground

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- SJB
- HVAC module - EATC or HVAC module - EMTC

PINPOINT TEST M: THE DEFROST SYSTEM IS INOPERATIVE - FUSION, MILAN

M1 CHECK THE DTCs

- Refer to the results from the previous SJB self-test.
- **Was DTC B1345 retrieved?**

  YES : Go to M2.

  NO : Go to M3.

M2 CHECK CIRCUIT CH122 (WH/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280D
- Disconnect: HVAC module - EATC C228A or HVAC module - EMTC C2357A

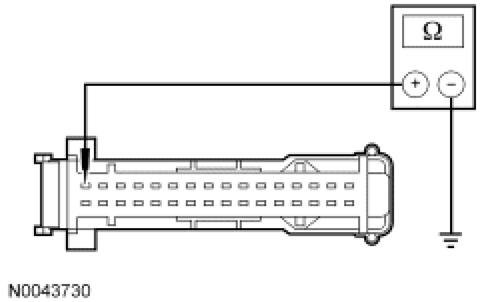

Fig. 60: Checking Circuit CH122 (WH/OG) For Short To Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280D-16, circuit CH122 (WH/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new HVAC module - EATC or HVAC module - EMTC. REFER to **CLIMATE CONTROL** article. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

M3 CHECK THE SJB REAR DEFROST SWITCH REQUEST PID (RDEF_SW)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - SJB
- Monitor the SJB PID RDEF_SW while pressing the rear defrost switch.
- **Does the PID value agree with the rear defrost switch when pressed?**

  YES : Go to M5.

  NO : Go to M4.

M4 CHECK CIRCUIT CH122 (WH/OG) FOR AN OPEN CIRCUIT

- Key in OFF position.
- Disconnect: SJB C2280D
- Disconnect: HVAC module - EATC C228A or HVAC module - EMTC C2357A

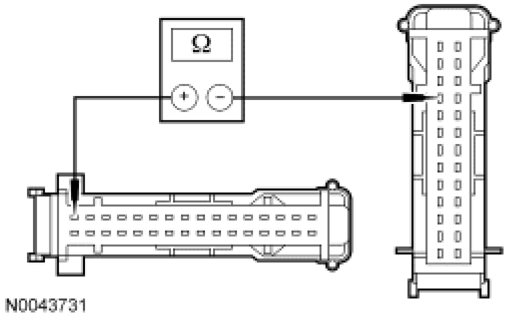

Fig. 61: Checking Circuit CH122 (WH/OG) For Open Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280D-16, circuit CH122 (WH/OG), harness side and HVAC module - EATC C228A-10 or HVAC module - EMTC C2357A-10, circuit CH122 (WH/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new HVAC module - EATC or HVAC module - EMTC. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

M5 CHECK THE SJB OUTPUT

- Disconnect: Rear Window Defrost Grid Power C402A

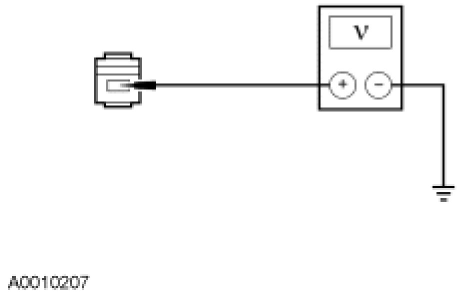

Fig. 62: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Turn the rear defroster ON. Measure the voltage between rear window defrost grid power C402A-1, circuit CLS38 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to M6.

  NO : Go to M7.

M6 CHECK THE REAR WINDOW DEFROST GROUND

- Key in OFF position.
- Disconnect: Rear Window Defrost Grid Ground C402B

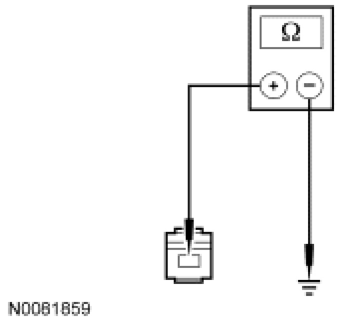

Fig. 63: Checking Rear Window Defrost Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between rear window defrost grid ground C402B-1, circuit GD147 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR the rear window defrost grid or INSTALL a new rear window glass. REFER to **Window Grid Wire Repair**, **Window Glass - Rear**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

M7 CHECK FOR POWER TO THE SJB HEATED BACKLIGHT CIRCUIT

- Key in OFF position.
- Disconnect: SJB C2280A

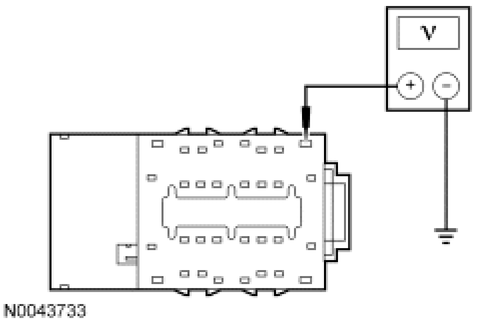

Fig. 64: Checking For Power To SJB Heated Backlight Circuit
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280A-29, circuit SBB06 (BN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to M8.

  NO : VERIFY battery junction box (BJB) fuse 6 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. TEST the system for normal operation.

M8 CHECK CIRCUIT CLS38 (VT/WH) FOR AN OPEN

- Disconnect: SJB C2280E
- Key in OFF position.

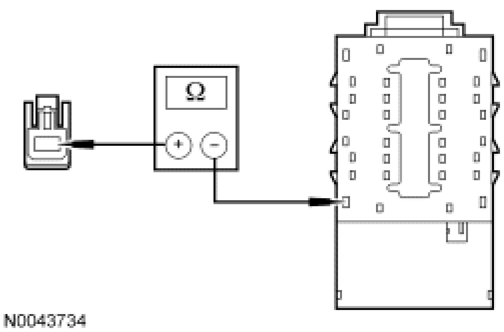

Fig. 65: Checking Circuit CLS38 (VT/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280E-1, circuit CLS38 (VT/WH), harness side and rear window defrost grid power C402A-1, circuit CLS38 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to M9.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

M9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all SJB connectors.
- Check for:

    - corrosion.
    - pushed-out pins.
  - Connect all SJB connectors and make sure they seat correctly.
  - Operate the system and verify the concern is still present.
  - **Is the concern still present?**

    YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for the removal and installation procedure. TEST the system for normal operation.

    NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test N: The Defrost System Will Not Shut Off Automatically - Fusion, Milan

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Heated Window for schematic and connector information.

Normal Operation

The heated backlight relay, which is integral to the smart junction box (SJB), receives power from circuit SBB06 (BN/RD). When the rear window defrost switch is pressed on the HVAC module - electronic automatic temperature control (EATC) or HVAC module - electronic manual temperature control (EMTC), a message is sent to the SJB through circuit CH122 (WH/OG). Once the SJB receives the message to turn on the rear window defrost, the SJB grounds the heated backlight relay coil, which sends power to the rear window defrost grid through circuit CLS38 (VT/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST N: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY - FUSION, MILAN

N1 CHECK CIRCUIT CLS38 (VT/WH) FOR SHORT TO VOLTAGE

  - Disconnect: SJB C2280E
  - Disconnect: Rear Window Defrost Grid Power C402A
  - Key in ON position.

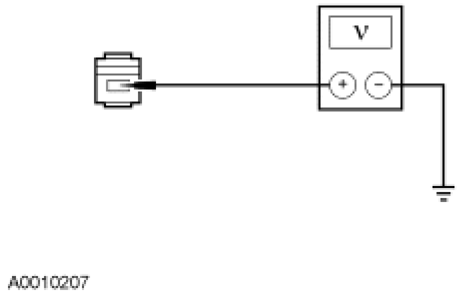

Fig. 66: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between rear window defrost grid power C402A-1, circuit CLS38 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for the removal and installation procedure. TEST the system for normal operation.

Component Test

Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire will appear as a brown spot.
2. Run the engine at idle. Set the heated rear window switch to ON. The indicator light should come on.
3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a loose ground connection.
4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.
5. With the negative lead of the meter grounded, touch each grid line of the heated rear window glass at its midpoint with the positive lead. A reading of approximately 6 volts indicates the line is good. A reading of 0 volt indicates the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates the circuit is broken between the midpoint of the grid line and ground.
6. Pinpointing the exact position of the break can be accomplished (if the voltmeter reads 0 volt when the midpoint of the grid line is touched with the positive lead of the voltmeter) by moving the positive lead of the voltmeter toward the B+ side of the grid line and touching the grid line until the voltmeter reads 12 volts. If the voltmeter reads 12 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter, simply move the positive lead of the voltmeter toward the ground connection of the grid line and touch the grid line until the voltmeter reads 0 volt.

GENERAL PROCEDURES

WINDOW GRID WIRE REPAIR

General Equipment

Polypropylene Film Fine Line Tape (Commercially available)

Material

Item	Specification
Lacquer Touch-Up Paint (match color to exterior grid wire) PM-19500-XXXX	ESR-M2P100-C
Rear Window Defroster Repair PM-11 (US); CPM-11 (Canada)	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

NOTE: **The grid line material is not embedded into the glass, but is baked to the glass surface and consequently can be scraped off. An undamaged grid line will have small ridges that project above the surface of the glass and can easily be felt when running a fingernail across them. Grid lines that have been "razor bladed" will feel smooth when a fingernail is dragged across the affected area. Inoperative lines may appear to the eye to be undamaged due to residue remaining on the glass and will require diagnosis with a voltmeter or 12V test lamp. For additional information, refer to DIAGNOSTIC TESTS.**

1. Bring the vehicle up to a room temperature of at least 16°C (60°F) or above.

   NOTE: **Do not use scrapers, sharp instruments or abrasive window cleaners on the interior surface of the rear window glass as this may cause damage to the grid lines.**

2. Clean the entire grid line repair area with window cleaner and 0000 steel wool to remove all dirt, wax, grease, oil or other foreign material.
3. Mark the location of the grid break on the exterior of the rear window glass.

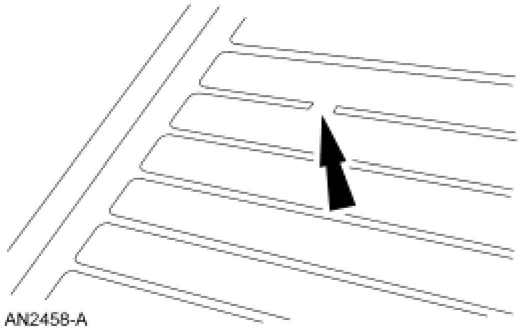

Fig. 67: Locating Grid Break
Courtesy of FORD MOTOR CO.

4. Using a polypropylene film fine line tape, mask the area directly above and below the grid break

extending the tape 26 mm (1.02 in) beyond the concern area in both directions. The break area should be at the center of the mask.

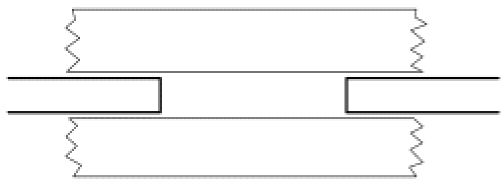

Fig. 68: Masking Grid Break Area
Courtesy of FORD MOTOR CO.

NOTE:	**If the brown layer is not broken or missing, apply only the silver grid repair compound to the break. If both the brown and silver layers of the grid are broken or missing, apply a coating of the lacquer touch up paint across the break in the grid line prior to applying the rear window defroster repair compound. Do not overlap the silver grid line with the paint. Several applications may be necessary to achieve a color match.**

NOTE:	**Allow at least 5 minutes of drying time between applications for the touch up paint or the silver repair coating. Applying fewer coats or not allowing adequate drying time between coats will produce repaired resistance that is greater than OEM resistance, resulting in poor defrost performance and excessive localized heating.**

5. Apply the repair coating to the grid break area in several smooth, continuous strokes. Extend the silver repair coating at least 6.35 mm (0.25 in) on both sides of the break area.

   Apply a minimum of 6 applications of the grid repair compound.

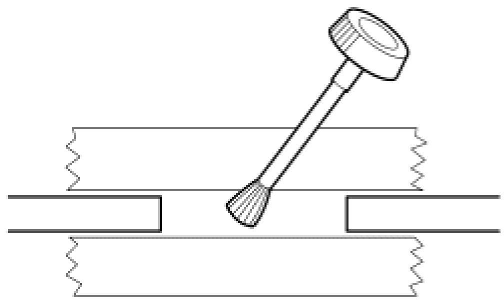

Fig. 69: Applying Repair Coating To Grid Break Area
Courtesy of FORD MOTOR CO.

NOTE: **The repair coating air-dries in approximately one minute and can be energized after 5 minutes. Optimum adhesion occurs after approximately 24 hours.**

6. Allow the repair area to dry completely and remove the mask.

NOTE: **Be careful not to damage the grid line with the razor blade. If this occurs, additional repair may be necessary.**

7. Remove any excess repair compound above or below the grid line with a razor blade.

NOTE: **The interior side of the grid lines are not painted, but due to the silver tarnishing will tend to change the grid to a gold or brown color. The repair area will be bright silver and will also tarnish over time to match the rest of the grid.**

8. Test the system for normal operation.

LEAD TERMINAL REPAIR

General Equipment

Terminal Kit - Back Glass 4F1Z-14421-AA

Material

Item	Specification
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Bring the vehicle up to room temperature of at least 16°C (60°F) or above.

NOTE: **The new terminal will cover the original terminal location, but it must be placed so that the terminal conductive areas will be placed on a good conductive base.**

2. Clean the bus bar in the area to be repaired with steel wool (000 to 0000 grade), and then with window cleaner to remove all dirt, wax, grease, oil or other foreign material.

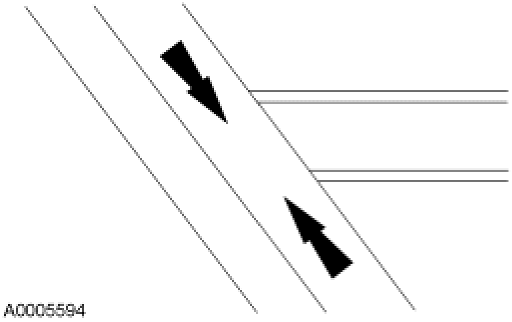

Fig. 70: Identifying Bus Bar Area To Be Repaired
Courtesy of FORD MOTOR CO.

NOTE: **Do not use any type of flame torch or flame-heated soldering gun for this procedure. Use of these tools provide inadequate heat generation at the tip and the exhaust heat can cause damage to plastic trim parts in the area. Use only an electric soldering gun with 100 watts or more of power. Before using the soldering gun, be sure to melt a small amount of rosin core solder to the tip. The solder will assist in achieving better heat transfer from the soldering gun tip to the new terminal.**

NOTE: **Depending on the original terminal location, and whether the terminal is covered by pillar trim, will determine where to locate the new terminal. Some grid line bus bars may only allow the placement of the terminal above or below the original tab location due to space limitations. For most vehicle applications, the replacement tab location will cover the original tab location, but still allow the replacement tab to attach to the bus bar on good conductive material.**

3. Place the replacement terminal type A over the original tab location, making sure the conductive areas of the terminal will be on a good conductive area. Do not place the terminal tab foot on the original location, which does not have conductive material.
4. Hold the terminal in place with an item such as a regular lead pencil at a 90 degree angle from the terminal. (Holding at other than a 90 degree angle may allow the terminal to slip when the solder liquefies.)

NOTE: **The new terminal has pre-applied solder, flux and temperature-sensitive paint. The paint provides a visual indication when the terminal has reached the correct temperature to melt solder on the terminal. When the correct temperature is achieved, the temperature paint will liquefy and change color.**

5. Place the soldering gun tip on the top of the terminal, but not on the painted areas of the tab. Energize the soldering gun and watch for the painted area of the terminal to liquefy and change color. The paint should liquefy in approximately 25-45 seconds after heating. As soon as the paint color completely changes on either side of the terminal, de-energize the soldering gun and continue to hold the terminal in place with

the soldering gun and pencil for an additional 30 seconds.

6. Remove the soldering gun and pencil from the terminal. The terminal should be allowed to cool for another 2 minutes before the wiring lead is attached to the terminal.
7. Attach the electrical lead connection to this terminal, turn on the heated rear window and verify the operation.

WINDOW MOTOR INITIALIZATION

NOTE: Initialization is required to learn both the full up and full down positions of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled.

NOTE: For MKZ only, the front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

NOTE: A new (original factory setting) or de-initialized LH or RH front window motor will not operate in one-touch up mode until initialized. If a new LH or RH front window motor has been installed, proceed to the initialization procedure.

NOTE: If diagnosing a LH or RH front window switch problem, perform the window initialization procedure before replacing the window switch.

NOTE: All LH or RH front window components (window glass, window regulator, window motor, seals and glass top run) must be installed and tightened to specification before carrying out the initialization procedure.

NOTE: Excessive bounce-back (window reverses direction with no obstructions present) may indicate that a de-initialization procedure may need to be performed.

De-Initialization procedure

NOTE: The LH or RH front window motor must be reset to it's original factory settings first, then perform the following de-initialization procedure.

1. Turn the ignition key ON.
2. Operate the window control switch in one-touch mode and remove power from the window motor **while the window is moving** by one of the following methods:
    1. Disconnect the vehicle battery cable **while the window is moving** .
    2. Disconnect the window motor connector **while the window is moving** .

3. Remove the LH or RH front window motor fuse **while the window is moving** .

3. This will de-initialize the window motor and reset the window motor to its original factory settings.
4. Perform the initialization procedure to turn the one-touch up feature on.

Initialization procedure

NOTE: The LH or RH front window must be in the full OPEN position for this procedure to operate correctly.

NOTE: If the initialization procedure is only partially completed, the LH or RH front window motor will remain un-initialized and will operate only in proportional up/down and one-touch down modes.

5. Turn the ignition key ON.
6. Activate and hold the window control switch in the UP position at the second detent until the window glass stalls for 2 seconds into the glass top run and release the switch.
7. Activate and hold the window control switch in the DOWN position at the second detent until the window glass stalls for 2 seconds at the bottom of its travel and release the switch.
8. Test for correct window operation by carrying out the one-touch up and one-touch down features.

GLASS RESEAL - WINDSHIELD

Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Sika Urethane Adhesive Sika Tack ASAP	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
2. Remove the LH and RH A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Remove the LH and RH sun visors.
4. If equipped, remove the overhead console.
5. Remove the LH and RH assist handles.
6. Lower the front portion of the headliner and block with a suitable material.
7. Clean the edge formed by the existing urethane and the glass on the inside at the top and sides and outside on the bottom of the windshield with glass cleaner.
8. Cut the urethane applicator tip to specification.

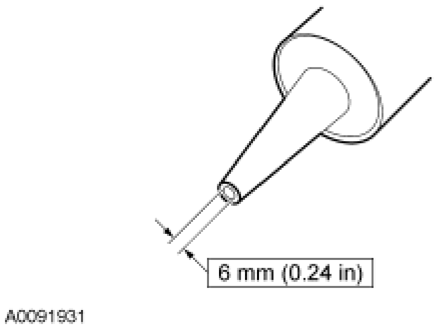

Fig. 71: Identifying Urethane Applicator Tip Specification
Courtesy of FORD MOTOR CO.

NOTE: Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.

NOTE: Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

9. Apply urethane adhesive over top of the existing urethane adhesive.
   - Apply the urethane to the top and sides of the windshield from the interior of the vehicle.
   - Apply the urethane to the bottom of the windshield from the exterior of the vehicle.

NOTE: The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

10. After the urethane has cured, check the windshield seal for air or water leaks through the urethane bead and add urethane adhesive as necessary.
11. Position the front portion of the headliner.
12. Install the LH and RH assist handles.
13. If equipped, install the overhead console.
14. Install the LH and RH sun visors.
15. Install the LH and RH A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
16. Install the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
17. Clean the interior and exterior windshield glass with glass cleaner.

GLASS RESEAL - REAR

Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Sika Urethane Adhesive	

Sika Tack ASAP	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the C-pillar trim panel and parcel shelf, and lower the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the rear window glass electrical connectors.
3. Clean the interior and exterior of the windshield glass surface with glass cleaner.
4. Cut the urethane adhesive applicator tip to specification.

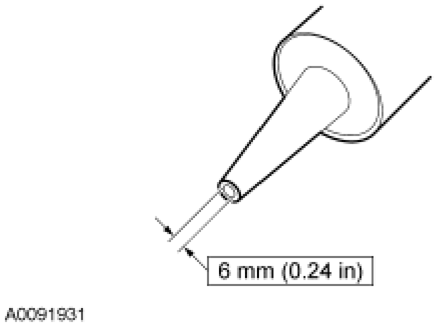

Fig. 72: Identifying Urethane Applicator Tip Specification
Courtesy of FORD MOTOR CO.

NOTE: **Use either a high ratio, electric or battery-operated caulk gun that applies the urethane with less effort and continuous bead.**

NOTE: **Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.**

5. Apply the urethane adhesive over the top of the existing urethane adhesive.
   - Apply the urethane adhesive to the top and sides of the rear glass from the interior of the vehicle.
   - Apply the urethane adhesive to the bottom of the rear glass from the exterior of the vehicle.

NOTE: **The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.**

6. After the urethane cures, check the rear glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
7. Connect the rear window glass electrical connectors.
8. Install the headliner, parcel shelf and C-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

REMOVAL AND INSTALLATION

GLASS, FRAMES AND MECHANISMS - EXPLODED VIEW, FRONT DOOR

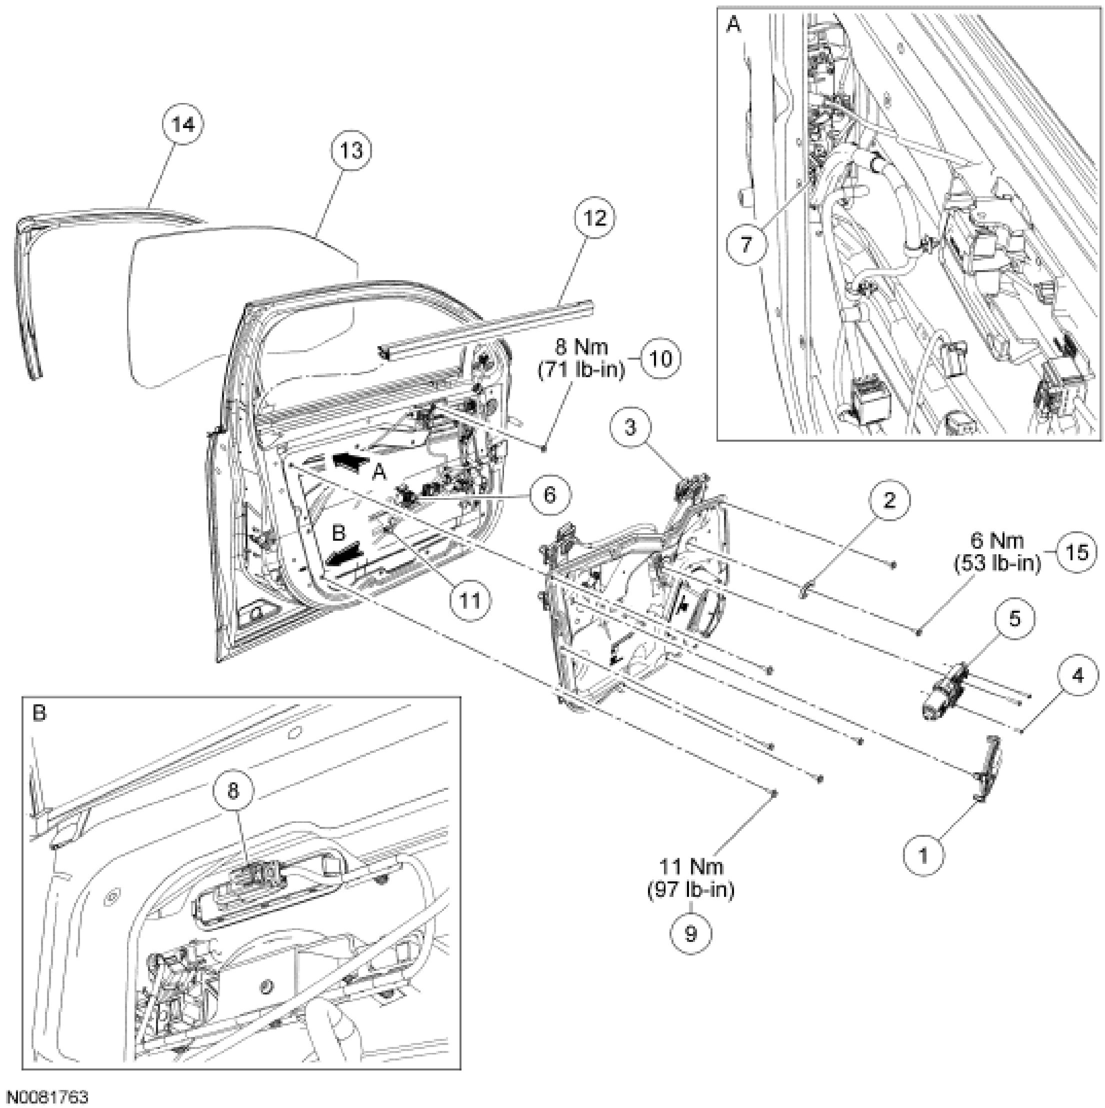

Fig. 73: Exploded View Of Front Door Glass, Frames & Mechanisms With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5402010	Wiring harness cover plate
2	378377-S	Access hole plug
3	5423201 LH/ 5423200 RH	Window regulator
4	W505966-S	Window motor screw (3 required)
5	5423395 LH/ 5423394 RH	Window motor
6	14489	Window motor electrical connector
7	14A464	Door latch electrical connector
8	14A464	Keypad latch electrical connector

9	W505421-S	Door module bolt (10 required)
10	-	Interior door handle bolt
11	-	Wiring harness retainer
12	5421457 LH/ 5421456 RH	Interior door window glass belt moulding
13	5421411 LH/ 5425712 RH	Front door window glass
14	5421597 LH/ 5421596 RH	Door window glass top run
15	378377-S	Window glass clamp bolt (2 required)

1. For additional information, refer to the procedures.

WINDOW GLASS - FRONT DOOR

REMOVAL AND INSTALLATION

NOTE: For MKZ only, if installing a new LH or RH front window motor, it must be initialized.

NOTE: For MKZ only, the LH or RH front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

1. Remove the front door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the wiring harness cover plate and the access hole plug.

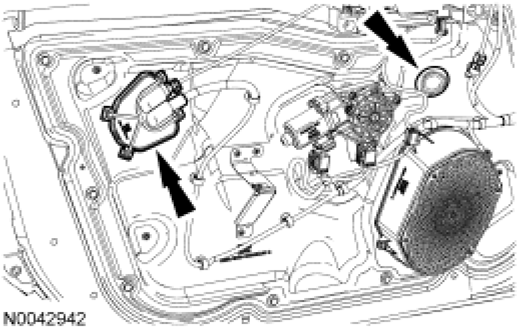

Fig. 74: Locating Wiring Harness Cover Plate And Access Hole Plug
Courtesy of FORD MOTOR CO.

NOTE: If the window regulator motor is inoperative, remove it. For additional information, refer to Window Regulator Motor.

3. Lower the window until the glass clamp bolts can be accessed through the access holes.
4. Loosen the B-pillar front door window glass clamp bolt.

- To install, tighten to 6 Nm (53 lb-in).

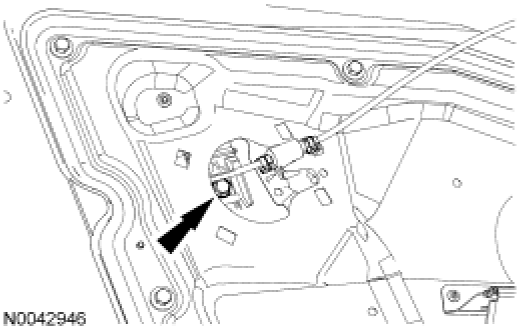

Fig. 75: Locating B-Pillar Front Door Window Glass Clamp Bolt
Courtesy of FORD MOTOR CO.

5. Loosen the A-pillar front door window glass clamp bolt.
    - To install, tighten to 6 Nm (53 lb-in).

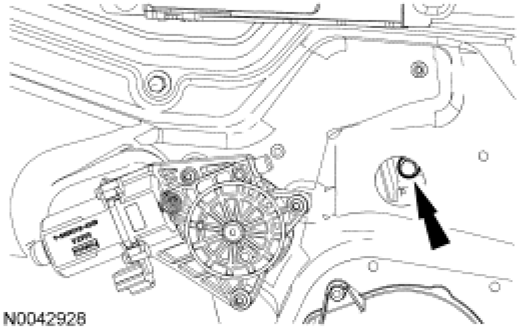

Fig. 76: Locating A-Pillar Front Door Window Glass Clamp Bolt
Courtesy of FORD MOTOR CO.

6. Tape the window in position, then lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
7. Lift the window glass out of the door.
8. To install, reverse the removal procedure.
    - For MKZ only, if installing a new LH or RH front window motor, it must be initialized. For additional information, refer to **Window Motor Initialization**. If installing the original front window motor, it must be de-initialized, then initialized. For additional information, refer to **Window Motor Initialization**.

WINDOW REGULATOR MOTOR

REMOVAL AND INSTALLATION

NOTE:	**For MKZ only, if installing a new LH or RH front window motor, it must be initialized.**

NOTE: **For MKZ only, the LH or RH front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the window motor electrical connector.
3. Secure the glass in position with tape.
4. Remove the 3 window motor screws.

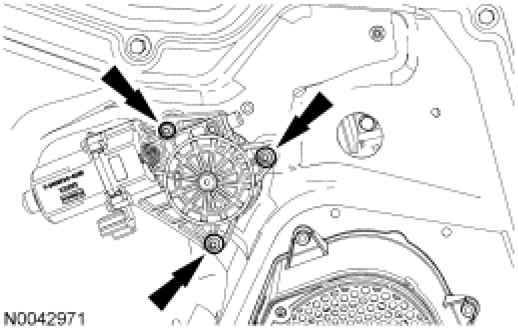

Fig. 77: Locating Window Motor Screws
Courtesy of FORD MOTOR CO.

5. Remove the window motor.
6. To install, reverse the removal procedure.
   - For MKZ only, if installing a new LH or RH front window motor, it must be initialized. For additional information, refer to **Window Motor Initialization**. If installing the original front window motor, it must be de-initialized, then initialized. For additional information, refer to **Window Motor Initialization**.

WINDOW REGULATOR AND MOTOR - FRONT DOOR

REMOVAL AND INSTALLATION

NOTE: **For MKZ only, if installing a new LH or RH front window motor, it must be initialized.**

NOTE: **For MKZ only, the LH and RH front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the wiring harness cover plate and the access hole plug.

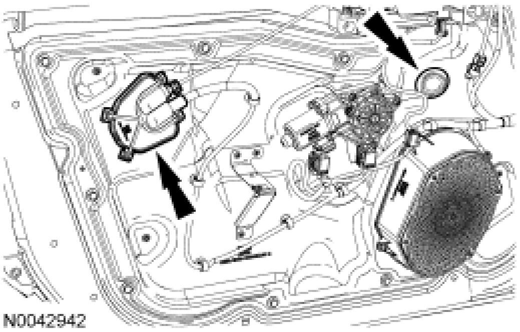

Fig. 78: Locating Wiring Harness Cover Plate And Access Hole Plug
Courtesy of FORD MOTOR CO.

NOTE: If the window regulator motor is inoperative, remove it. For additional information, refer to Window Regulator Motor.

3. Lower the window enough to access the window glass clamp bolts through the access holes.
4. Loosen the B-pillar window glass clamp bolt and disconnect the door latch cable retainers.
   - To install, tighten to 6 N.m (53 lb-in).

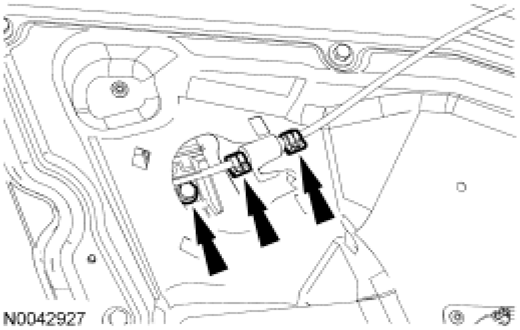

Fig. 79: Locating B-Pillar Window Glass Clamp Bolt And Door Latch Cable Retainers
Courtesy of FORD MOTOR CO.

5. Loosen the A-pillar window glass clamp bolt.
   - To install, tighten to 6 N.m (53 lb-in).

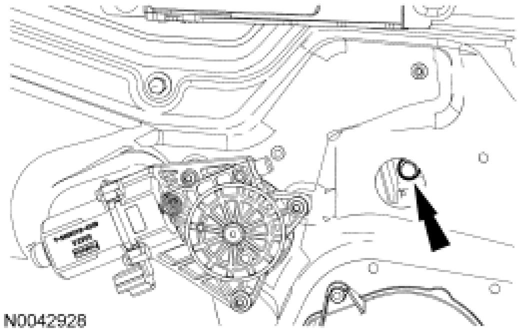

Fig. 80: Locating A-Pillar Front Door Window Glass Clamp Bolt
Courtesy of FORD MOTOR CO.

6. Tape the window in position, then lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
7. Remove the front door speaker. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
8. Remove the interior door handle bolt and position the door handle aside.

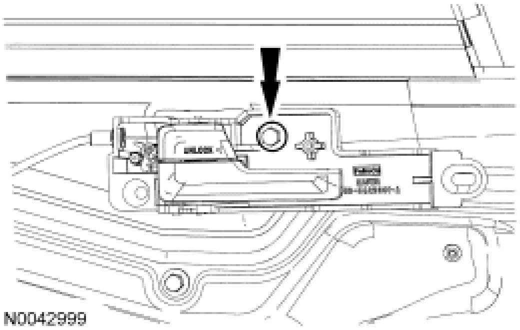

Fig. 81: Locating Interior Door Handle Bolt
Courtesy of FORD MOTOR CO.

9. Disconnect the wiring harness retainers.

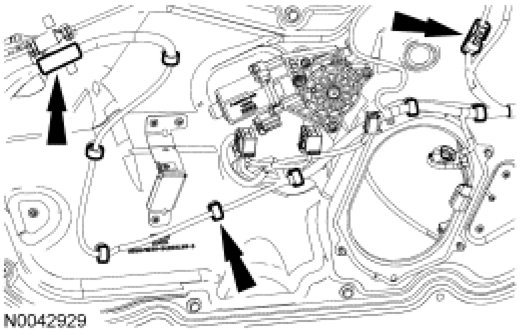

Fig. 82: Locating Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

10. Disconnect the door latch electrical connector.

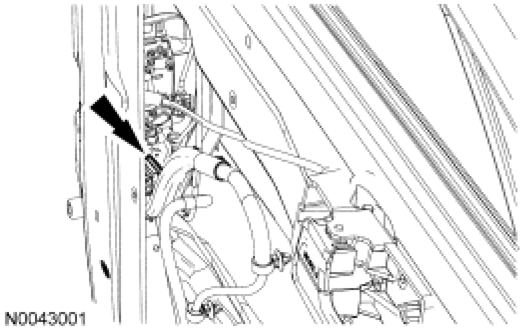

Fig. 83: Locating Door Latch Electrical Connector
Courtesy of FORD MOTOR CO.

11. If equipped, disconnect the keyless entry keypad and door lock electrical connector and release from the bracket.

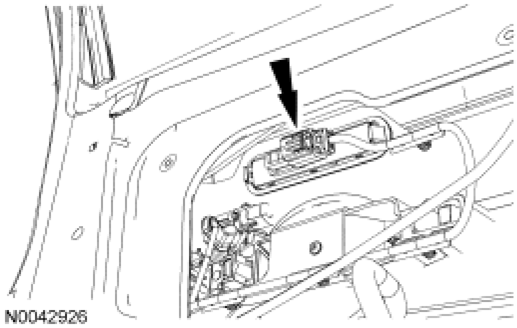

Fig. 84: Locating Door Lock Electrical Connector
Courtesy of FORD MOTOR CO.

12. If equipped, disconnect the power mirror electrical connector.

Fig. 85: Locating Power Mirror Electrical Connector
Courtesy of FORD MOTOR CO.

13. Remove the 10 door module bolts and the window regulator motor electrical connector.

- To install, tighten to 11 N.m (97 lb-in).

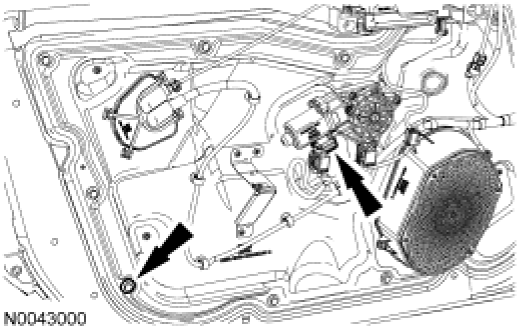

Fig. 86: Locating Window Regulator Motor Electrical Connector And Door Module Bolts
Courtesy of FORD MOTOR CO.

14. Remove the front door module. If installing a new door module, transfer parts as necessary.
15. To install, reverse the removal procedure.
    - For MKZ only, if installing a new LH or RH front window motor, it must be initialized. For additional information, refer to **Window Motor Initialization**. If installing the original front window motor, it must be de-initialized, then initialized. For additional information, refer to **Window Motor Initialization**.

DOOR GLASS TOP RUN - FRONT

REMOVAL AND INSTALLATION

NOTE: **For MKZ only, the front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

1. Remove the front door window glass. For additional information, refer to **Window Glass - Front Door**.
2. Remove the front door window glass inner weatherstrip.

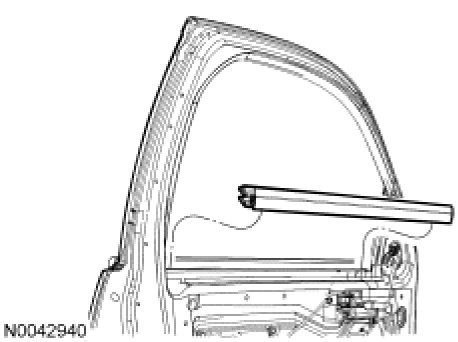

Fig. 87: Identifying Front Door Window Glass Inner Weatherstrip

Courtesy of FORD MOTOR CO.

3. Remove the front door glass top run.

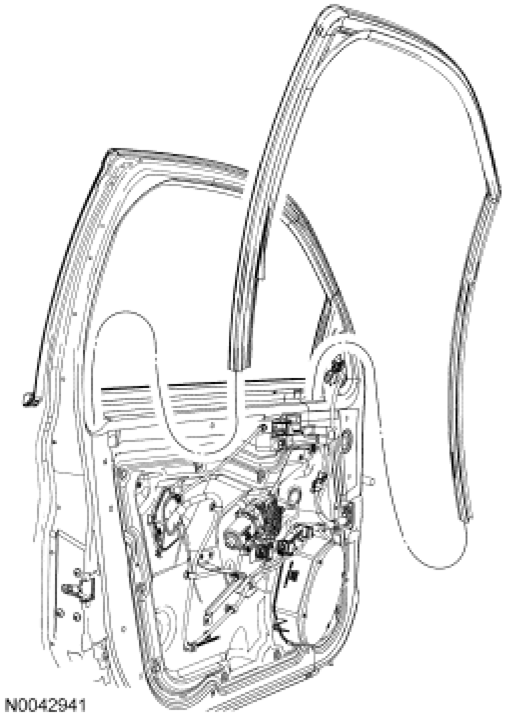

Fig. 88: Identifying Front Door Glass Top Run
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

GLASS, FRAMES AND MECHANISMS - EXPLODED VIEW, REAR DOOR

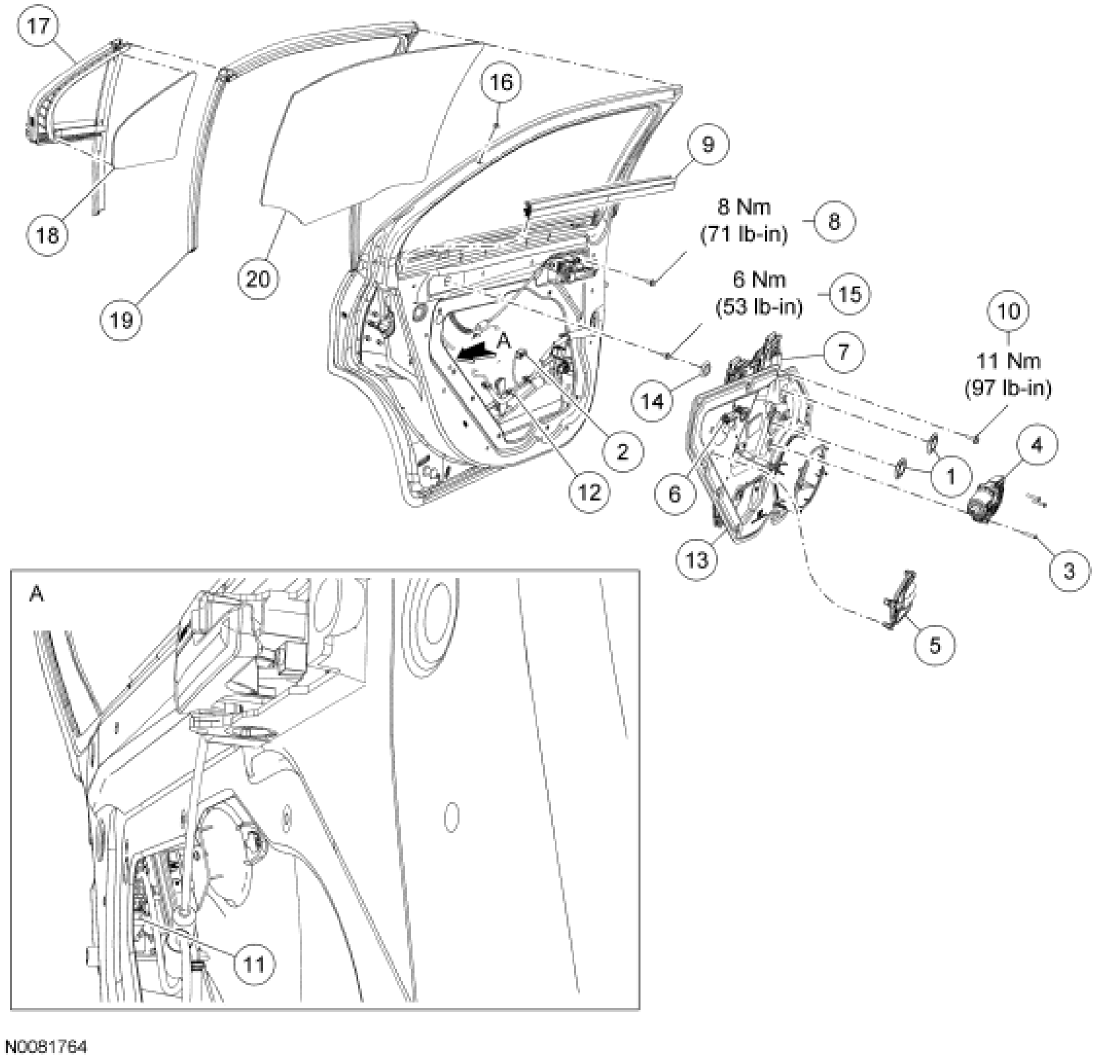

Fig. 89: Exploded View Of Rear Door Glass, Frames & Mechanisms With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	378377	Access hole plugs
2	14489	Electrical connector
3	W505966-S	Screw (3 required)
4	5423395 LH/ 5423394 RH	Window regulator motor
5	5402010	Wiring harness cover plate
6	-	Clip
7	5427001 LH/ 5427000 RH	Window regulator
8	-	Interior door handle bolt
9	5425861 LH/ 5425860 RH	Interior door window glass belt moulding
10	W505421-S	Door module bolt (10 required)

11	14A464	Rear door latch electrical connector
12	-	Wiring harness retainer
13	54235A89 LH/ 54235A88 RH	Rear door module
14	W651013-S	Access hole plug
15	W506410-S	Window regulator glass clamp bolt (2 required)
16	N811106-S	Upper C-pillar rear glass run bolt
17	5429905 LH/ 5429904 RH	Rear door fixed glass weatherstrip
18	5426871 LH/ 5426870 RH	Rear door fixed glass
19	5425767 LH/ 5425766 RH	Rear door glass top run
20	5425713 LH/ 5425712 RH	Rear door window glass

1. For additional information, refer to the procedures.

WINDOW GLASS - REAR DOOR

REMOVAL AND INSTALLATION

1. Remove the rear door fixed window glass. For additional information, refer to **Window Glass - Rear Door, Fixed**.
2. Remove the top run.
3. Remove the rear window glass.
4. To install, reverse the removal procedure.

WINDOW REGULATOR AND MOTOR - REAR DOOR

REMOVAL AND INSTALLATION

1. Remove the rear door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the access hole plugs.

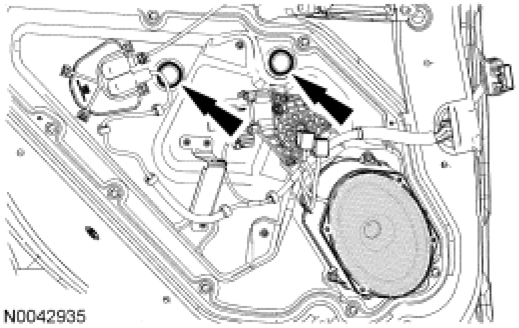

Fig. 90: Locating Access Hole Plugs
Courtesy of FORD MOTOR CO.

NOTE: **If the door window regulator motor is inoperative, remove it. For additional information, refer to Window Regulator Motor.**

3. Lower the window until the glass clamp bolts are accessible through the access hole plugs, then loosen the glass clamp bolts.
    - To install, tighten to 6 N.m (53 lb-in).

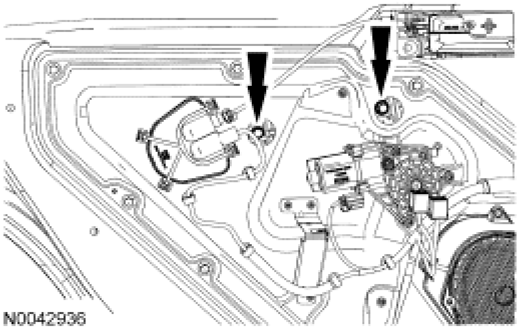

Fig. 91: Locating Glass Clamp Bolts
Courtesy of FORD MOTOR CO.

4. Tape the window in position, then lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
5. Remove the door speaker. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
6. Remove the interior door handle screw and position the door handle aside.

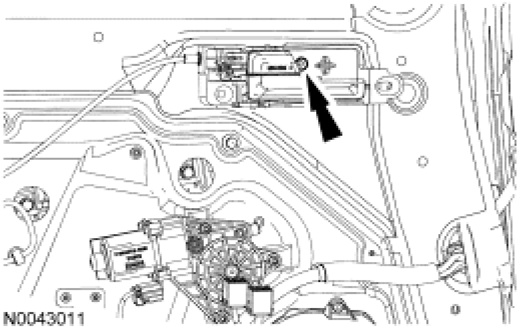

Fig. 92: Locating Interior Door Handle Screw
Courtesy of FORD MOTOR CO.

7. Disconnect the wiring harness retainers.

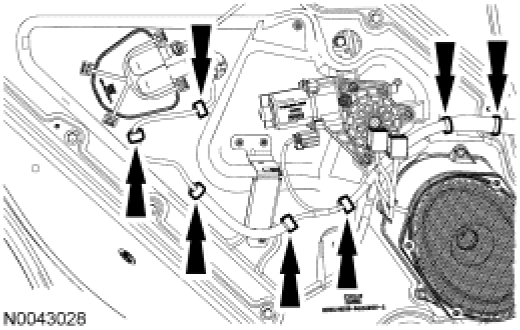

Fig. 93: Locating Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

8. Remove the wiring harness cover plate and disconnect the 2 door latch cable retainers.

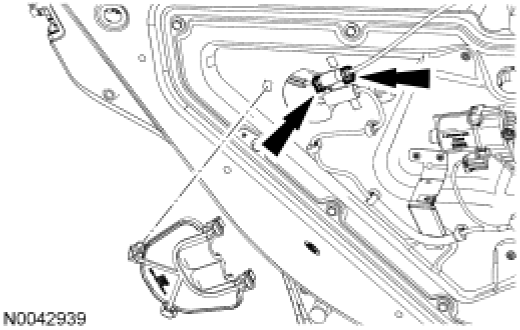

Fig. 94: Locating Wiring Harness Cover Plate & Door Latch Cable Retainers
Courtesy of FORD MOTOR CO.

9. Remove the 10 door module bolts.
   - To install, tighten to 11 N.m (97 lb-in).

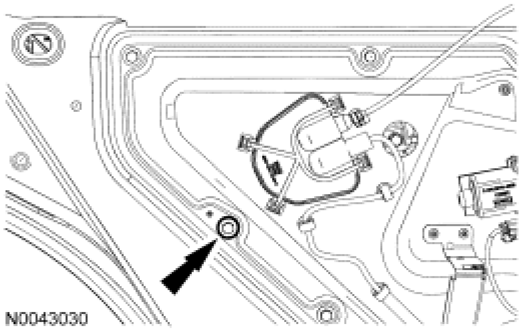

Fig. 95: Locating Door Module Bolts
Courtesy of FORD MOTOR CO.

10. Disconnect the door latch electrical connector.

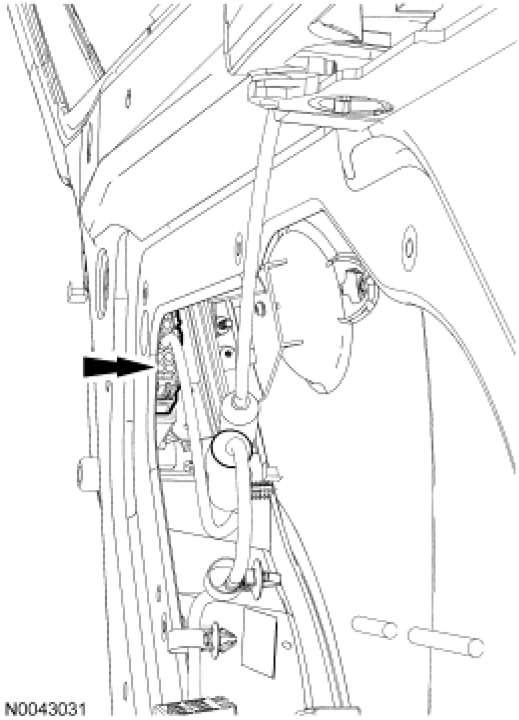

Fig. 96: Locating Door Latch Electrical Connector
Courtesy of FORD MOTOR CO.

11. Remove the rear door module assembly. If installing a new door module, transfer parts as necessary.
12. To install, reverse the removal procedure.

DOOR GLASS RUN AND BRACKET - REAR

REMOVAL AND INSTALLATION

1. Remove the rear door fixed window glass. For additional information, refer to **Window Glass - Rear Door, Fixed**.
2. Carefully position the glass aside, then remove the rear door glass top run.
3. To install, reverse the removal procedure.

WINDOW CONTROL SWITCH

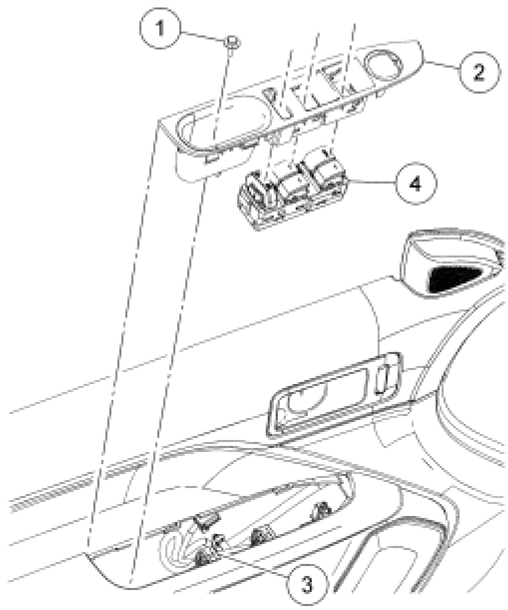

Fig. 97: Exploded View Of Window Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W703268	Screw
2	54266	Window control switch bezel
3	-	Electrical connector (3 required)
4	14529	Window control switch

REMOVAL AND INSTALLATION

1. Remove the window regulator control switch bezel.
   - Remove the screw.
   - Disconnect the electrical connectors.
2. Remove the window control switch.
3. To install, reverse the removal procedure.

WINDOW GLASS - REAR

Special Tools

Illustration	Tool Name	Tool Number
	Interior Auto Glass Cut-Out Knife Kit (Electric)	164-R2450 or equivalent

 ST2834-A

Item	Part Number	Description
1	5442006	Rear window glass
2	-	Moulding

REMOVAL

NOTE: If the rear window glass is being removed to repair a dust/water leak, remove and reinstall the existing rear window glass.

1. Remove the C-pillar trim panel and parcel shelf, and lower the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the 2 rear window defrost electrical connectors.
3. Before cutting the urethane adhesive, remove dirt and other foreign material from the rear window pinchweld area.
   - Use a clean shop towel or oil-free, compressed air.

   NOTE: Refer to manufacturer's instructions before using the special tool.

4. Lubricate the urethane adhesive with water to aid the Interior Auto Glass Cut-Out Knife Kit (Electric) when cutting.

   WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

   WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

   CAUTION: To avoid rust formation, use extreme care not to scratch the paint or primer or otherwise damage the pinchweld during glass removal.

   NOTE: Insert the blade into the Interior Auto Glass Cut-Out Knife Kit (Electric) so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinchweld and allow a dry fit of the replacement rear window glass.

   NOTE: Support the rear window glass to prevent the glass from dropping while cutting the urethane adhesive.

5. Insert the Interior Auto Glass Cut-Out Knife Kit (Electric) at the upper center of the rear window glass

and work toward the bottom corners.

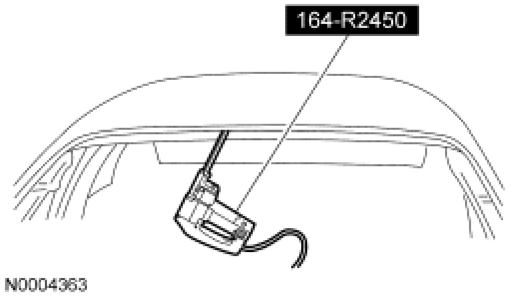

Fig. 99: Cutting Urethane Adhesive From Glass
Courtesy of FORD MOTOR CO.

6. Using The Pumper, distance the rear window glass from the body.

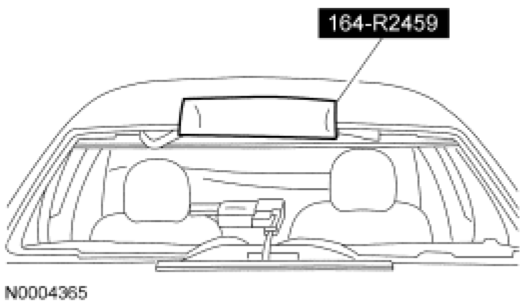

Fig. 100: Identifying Special Tool (164-R2459)
Courtesy of FORD MOTOR CO.

7. Insert the Interior Auto Glass Cut-Out Knife Kit (Electric) into the bottom of the urethane adhesive and cut from corner to corner.
8. Carefully remove the rear window glass from the vehicle and place on a stable work surface.

INSTALLATION

1. Dry-fit the rear window glass on the existing urethane adhesive bead on the pinch weld.
   - Position the glass on the pinch weld.
   - Center the glass in the opening.
   - Make alignment marks with tape or non-staining grease pencil on the rear window glass and the body.
2. After the dry-fit alignment, remove the glass from the body opening and place on a stable work surface with the interior side of the glass facing upward.

WARNING: **Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may**

reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: **Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld following glass primer manufacturer's recommendations before installation of the glass. Be sure to use the same brand and cure-rate products for the adhesive and primer.**

3. Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) base of original equipment urethane on the pinchweld.

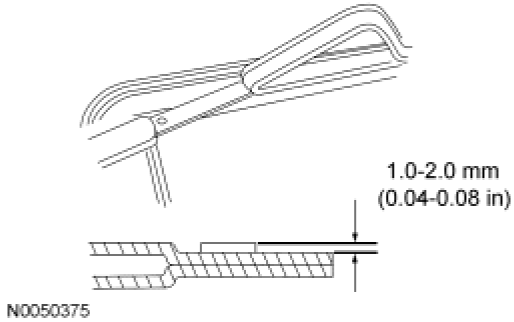

Fig. 101: Trimming Remaining Urethane Adhesive To Specification
Courtesy of FORD MOTOR CO.

4. Using a clean shop towel, brush or oil-free, compressed air, clean the pinch weld area around the existing urethane. Remove any foreign material or water that may have entered during glass removal.
5. If reinstalling the same rear window glass, remove the remaining urethane adhesive from the glass leaving a thin layer to bond with the new urethane bead.
6. Clean the inside of the new rear window glass surface with glass cleaner.

NOTE: **Be sure to use the same brand and cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Material Chart in this procedure.**

NOTE: **Sika uses the same black primer for the glass and pinch weld area.**

7. If installing a new rear window glass, apply urethane glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.
8. Cut the urethane adhesive applicator tip to specification.

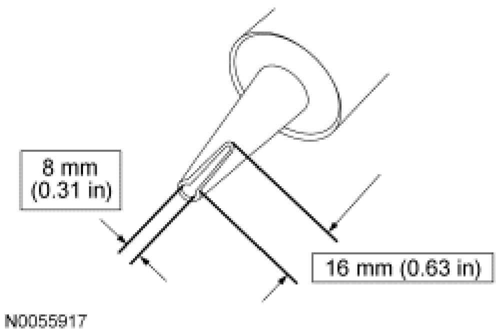

Fig. 102: Cutting Urethane Adhesive Applicator Tip With Specifications
Courtesy of FORD MOTOR CO.

NOTE: Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and continuous bead.

NOTE: The rear window glass must be positioned within 10 minutes of applying the urethane adhesive.

9. Apply a uniform bead of urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld.
    - Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead starting and ending at the bottom of the rear window glass near the center.

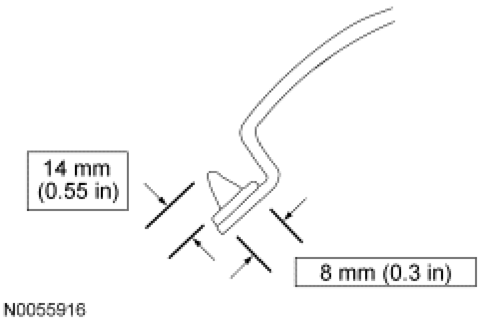

Fig. 103: Identifying Adhesive Application With Specifications
Courtesy of FORD MOTOR CO.

WARNING: **Do not drive vehicle until the urethane adhesive seal has cured. Follow urethane adhesive manufacturer's curing directions. Inadequate or incorrect curing of the urethane adhesive seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

CAUTION: Before positioning the rear window glass, open vehicle windows to prevent the air pressure of closing doors from affecting the adhesive bond.

10. Using the alignment marks made previously, position the rear window glass on the pinch weld.

NOTE: The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

11. After the urethane has cured, check the rear window glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
12. Install the headliner, parcel shelf and C-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
13. Connect the LH and RH heated rear window electrical connector.

WINDOW GLASS - REAR DOOR, FIXED

REMOVAL AND INSTALLATION

1. Remove the rear door module. For additional information, refer to **Window Regulator and Motor - Rear Door**.
2. Remove the access hole plug.

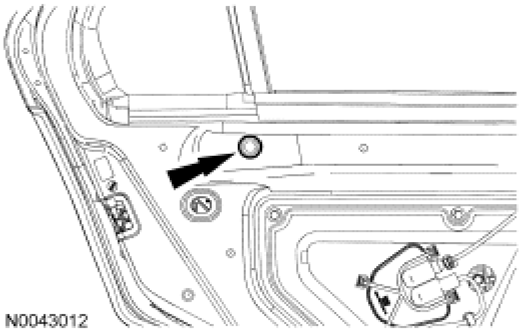

Fig. 104: Locating Access Hole Plug
Courtesy of FORD MOTOR CO.

3. Remove the bolt and the screw.

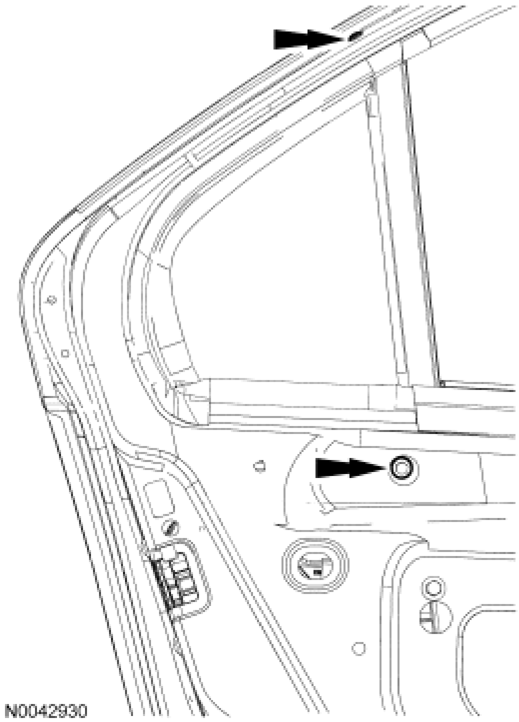

Fig. 105: Locating Bolt And Screw
Courtesy of FORD MOTOR CO.

4. Remove the inner beltline weatherstrip.

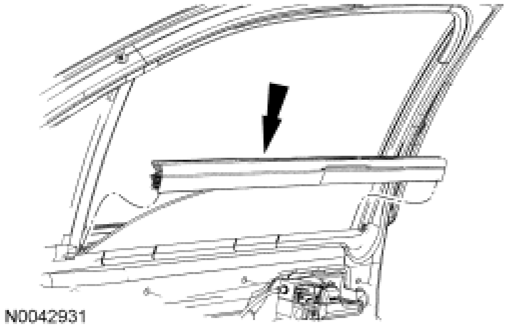

Fig. 106: Locating Inner Belt Line Weatherstrip
Courtesy of FORD MOTOR CO.

5. Remove the screw and the outer beltline weatherstrip.

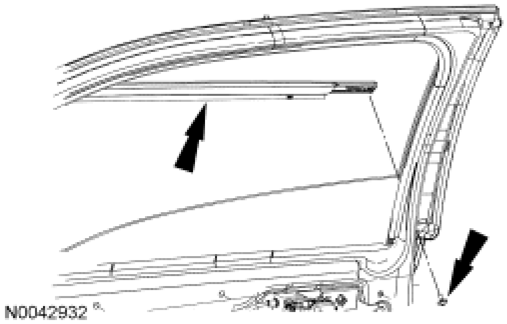

Fig. 107: Locating Outer Belt Line Weatherstrip
Courtesy of FORD MOTOR CO.

6. Position the rear window glass run aside.

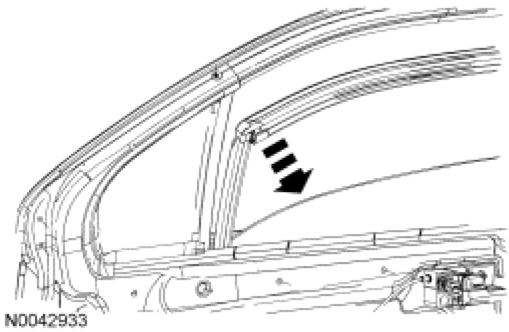

Fig. 108: Identifying Rear Window Glass Position
Courtesy of FORD MOTOR CO.

7. Remove the rear door fixed window glass assembly.

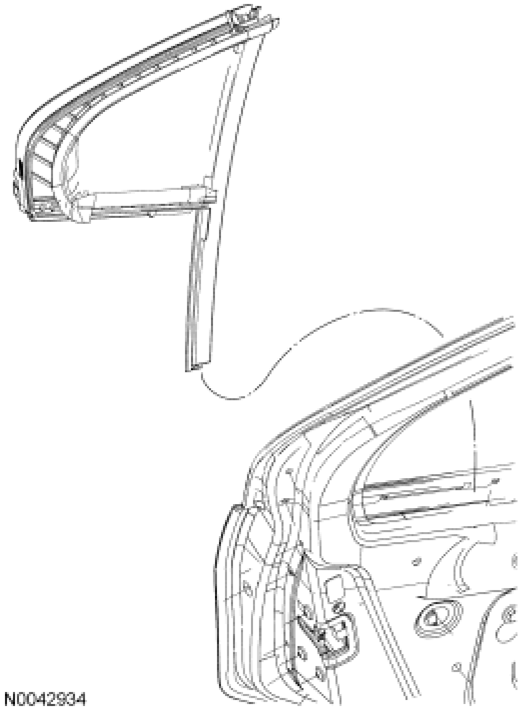

Fig. 109: Identifying Rear Quarter Window Glass
Courtesy of FORD MOTOR CO.

8. To install, reverse the removal procedure.

WINDSHIELD GLASS

Item	Part Number	Description
1	-	Moulding
2	5403100	Windshield

REMOVAL

NOTE: If the windshield glass is being removed to repair a dust/water leak, remove and reinstall the existing windshield glass.

1. Remove the A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the sun visors.
3. Remove the interior mirror. For additional information, refer to **REAR VIEW MIRRORS** article.

4. Partially lower the front portion of the headliner near the windshield header and block with suitable material. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
5. Remove the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
6. Before cutting the urethane adhesive, remove dirt and other foreign material from the windshield pinchweld area.
   - Use a clean shop towel or oil-free, compressed air.

NOTE: Refer to manufacturer's instructions before using the Interior Auto Glass Cut-Out Knife Kit (Electric).

7. Lubricate the urethane adhesive with water to aid the Interior Auto Glass Cut-Out Knife Kit (Electric) when cutting.

WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

CAUTION: To avoid rust formation, use extreme care not to scratch the paint or primer or otherwise damage the pinchweld during glass removal.

NOTE: Insert the blade into the Interior Auto Glass Cut-Out Knife Kit (Electric) so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinchweld and allow a dry fit of the replacement windshield glass.

NOTE: Support the windshield glass to prevent the glass from dropping while cutting the urethane adhesive.

8. Insert the Interior Auto Glass Cut-Out Knife Kit (Electric) at the upper center of the windshield glass and work toward the bottom corners.

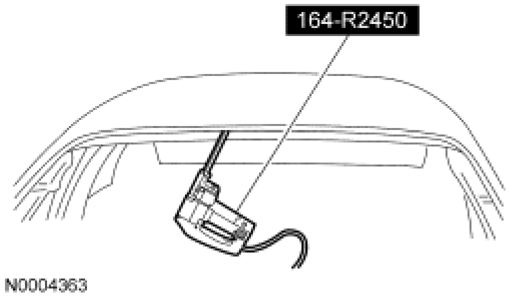

Fig. 111: Cutting Urethane Adhesive From Glass
Courtesy of FORD MOTOR CO.

9. Using The Pumper, distance the windshield glass from the body.

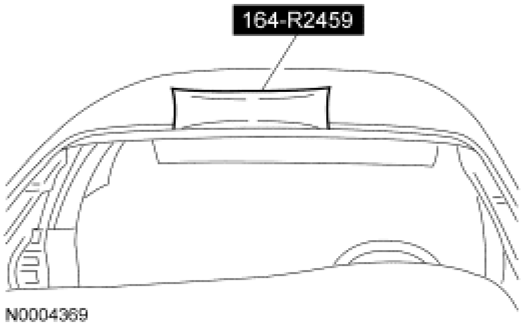

Fig. 112: Distancing Windshield Glass From The Body
Courtesy of FORD MOTOR CO.

10. Insert the Interior Auto Glass Cut-Out Knife Kit (Electric) into the bottom of the urethane adhesive and cut from corner to corner.
11. Carefully remove the windshield glass from the vehicle and place on a stable work surface.

INSTALLATION

1. Dry-fit the windshield glass on the existing urethane adhesive bead on the pinch weld.
    - Position the windshield glass on the pinch weld.
    - Center the glass in the opening.
    - Adjust the windshield glass stop blocks (if equipped) as needed for best fit.
    - Make alignment marks with tape or non-staining grease pencil (preferably at the windshield glass stop blocks) on the windshield glass and the body.
2. After the dry-fit alignment, remove the glass from the body opening and place on a stable work surface with the interior side of the glass facing upward.

WARNING: **Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this**

instruction may result in serious injury to vehicle occupant(s).

NOTE: **Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld following glass primer manufacturer's recommendations before installation of the glass. Be sure to use the same brand and cure-rate products for the adhesive and primer.**

3. Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) base of original equipment urethane on the pinchweld.

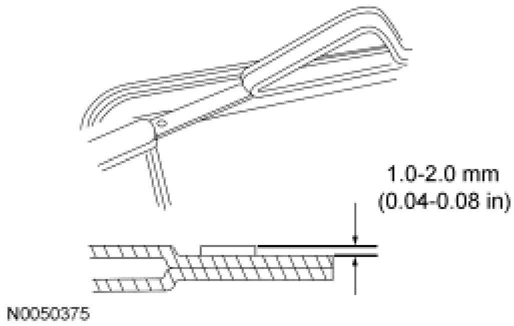

Fig. 113: Trimming Remaining Urethane Adhesive To Specification
Courtesy of FORD MOTOR CO.

4. Using a clean shop towel, brush or oil-free, compressed air, clean the pinch weld area around the existing urethane. Remove any foreign material or water that may have entered during glass removal.
5. If reinstalling the same windshield glass, remove the remaining urethane adhesive from the glass leaving a thin layer to bond with the new urethane bead.
6. Clean the inside of the windshield glass surface with glass cleaner.
   - Make sure to thoroughly clean the surface of the blackened border area where the urethane adhesive will be applied.

NOTE: **Be sure to use the same brand and cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Material Chart in this procedure.**

NOTE: **Sika uses the same black primer for the glass and pinch weld area.**

7. If installing a new windshield glass, apply urethane glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.
8. Cut the urethane adhesive applicator tip to specification.

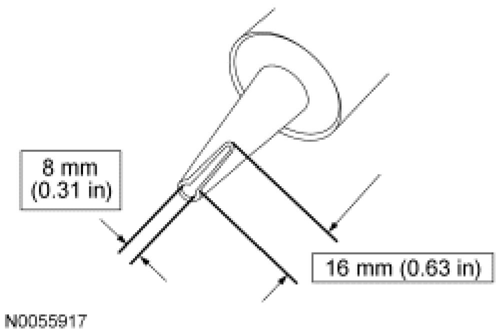

Fig. 114: Cutting Urethane Adhesive Applicator Tip With Specifications
Courtesy of FORD MOTOR CO.

NOTE: **Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and continuous bead.**

NOTE: **The windshield glass must be positioned within 10 minutes of applying the urethane adhesive.**

9. Apply a uniform bead of urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld.
   - Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead starting and ending at the bottom of the windshield glass near the center.

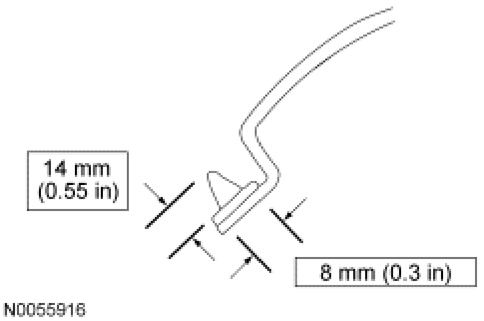

Fig. 115: Identifying Adhesive Application With Specifications
Courtesy of FORD MOTOR CO.

WARNING: **Do not drive vehicle until the urethane adhesive seal has cured. Follow urethane adhesive manufacturer's curing directions. Inadequate or incorrect curing of the urethane adhesive seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

CAUTION: **Before positioning the windshield glass, open vehicle windows to prevent the air pressure of closing doors from affecting the adhesive bond.**

10. Using the alignment marks made previously, position the windshield glass on the pinch weld.

NOTE: The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

11. After the urethane has cured, check the windshield glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
12. Install the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
13. Install the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
14. Install the interior mirror. For additional information, refer to **REAR VIEW MIRRORS** article.
15. Install the sun visors.
16. Install the A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

Luggage compartment lid striker bolts	9	-	80

DESCRIPTION AND OPERATION

HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Hood Latch

The hood latch consists of the following components:

- Hood latch release handle and cable
- Hood latch

Front Door

The front door consists of the following components:

- Door ajar switch (part of the front door latch)
- Door lock cylinder (if equipped)
- Exterior front door handle
- Exterior front door handle reinforcement
- Front door latch
- Front door lock actuator (part of the front door latch)
- Interior door handle actuating cable
- Interior door handle
- Keyless entry keypad (if equipped)

Rear Door

The rear door consists of the following components:

- Door ajar switch (part of the rear door latch)
- Exterior rear door handle
- Exterior rear door handle reinforcement
- Interior door handle actuating cable (part of the rear door latch)
- Interior door handle
- Rear door latch
- Rear door lock actuator (part of the rear door latch)

Luggage Compartment Lid

The luggage compartment lid consists of the following components:

- Luggage compartment lid latch
- Luggage compartment lid lock cylinder
- Luggage compartment lid release switch (next to headlamp switch)
- Lock cylinder actuating cable (part of the luggage compartment lid latch)
- Mechanical emergency release cable and handle (part of the luggage compartment lid latch)

Power Lock/Unlock

The power lock/unlock feature requests all of the vehicle doors locked or unlocked upon a customer request from either door lock control switch in the vehicle. The power door locking system functions independently of ignition status or vehicle speed.

Autolock

NOTE: The autolock feature is not available on vehicles equipped with a manual

transmission.

The autolock feature locks all the doors when all the doors are closed, the key is in the ON position, the transmission is in either a forward or reverse gear, and the vehicle speed is greater than 20 km/h (12 mph).

The autolock feature repeats when any door is opened then closed while the ignition is still in the ON position, the vehicle speed is 15 km/h (9 mph) or slower, and the vehicle then attains a speed greater than 20 km/h (12 mph).

Auto-Unlock

NOTE:	**The doors will not auto-unlock if the vehicle has been electronically locked before the driver door is opened.**

NOTE:	**The auto-unlock feature is disabled on vehicles equipped with a manual transmission.**

The auto-unlock feature unlocks all the doors when the ignition is in the ON position, all the doors are closed, and the vehicle has been in motion at a speed greater than 20 km/h (12 mph), the vehicle then comes to a stop and the ignition is switched to LOCK or ACC, and the driver door is opened within 10 minutes of the ignition being switched to LOCK or ACC.

Smart Unlock

The smart unlock feature prevents the doors from locking with the key in the ignition lock cylinder. When the SJB receives a lock command from a door lock control switch (only), and the key is in the ignition lock cylinder with one of the front doors open, the SJB commands the doors to unlock.

The vehicle can still be locked with the ignition key in the ignition cylinder by locking the doors with the push button rods, the door lock cylinder or an RKE command from an integrated key or the keyless entry keypad.

Remote Keyless Entry (RKE)

The remote keyless entry (RKE) system uses an integrated key head transmitter (IKT). The IKT incorporates both the passive anti-theft system (PATS) functions and the RKE transmitter functions in a single device.

The RKE transmitter is programmed automatically during PATS programming. During PATS programming, the instrument cluster (IC) obtains the transmitter identification code (TIC) from the IKT and sends the TIC data over the medium speed controller area network (MS-CAN) to the SJB.

The SJB accepts programming of up to 4 IKTs. In addition to the IKTs, 6 conventional keyfobs can also be programmed to the vehicle if requested by the customer. For information on programming the IKTs, refer to Key Programming Using Two Programmed Keys or Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. For information on programming the conventional keyfobs, refer to **Remote Keyless Entry Transmitter Programming**.

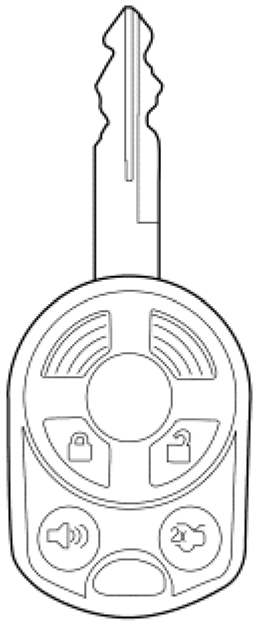

Fig. 1: Remote Keyless Entry (RKE)
Courtesy of FORD MOTOR CO.

The IKT performs the following functions:

- Unlock the driver door
- Unlock all doors
- Lock all doors
- Release the luggage compartment lid latch
- Arm/disarm the perimeter alarm (if equipped)
- Activate/deactivate the panic alarm
- Command the interior lamps on (when unlocking) and off (when locking)
- Recall the memory seat position associated with a particular remote entry device (when enabled)
- Sound the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sound the horn twice when LOCK is pressed twice within 3 seconds, and any door is ajar

The IKT has a normal operating range of 10 m (33 ft).

Remote Keyless Entry (RKE) Lock/Unlock Control - Unlock

The RKE feature provides lock/unlock functions independently of key position, vehicle speed, or transmission position. The RKE feature provides a stepped (if enabled) process for unlocking the doors. Upon receipt of the first request for unlocking the doors, the RKE control feature requests the SJB to unlock the driver door only. If another unlock request is received within 3 seconds of the first, the RKE feature requests the SJB to unlock all

the doors. This feature can be configured to global unlock, so that all the doors unlock on the first press of the unlock button. Refer to **Stepped Unlock Programming** for programming information.

Remote Keyless Entry (RKE) Lock/Unlock Control - Lock

The RKE feature requests that all the doors be locked when the lock button is pressed. On any press of the lock button with all doors closed, the SJB provides one flash of the turn signals. If any door is ajar, no flash occurs. As soon as the last door is closed, the SJB provides the flash of the turn signals. If 2 presses of the lock button are received within 3 seconds, the horn chirps once and the turn signals flash twice to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within 3 seconds of the first, the RKE transmitter feature requests the SJB chirp the horn twice without flashing the turn signals to indicate it locked all the doors but one or more doors are ajar. When the key is in the ON or START position, the turn signal flashes and horn chirp confirmations do not occur.

Remote Keyless Entry (RKE) Luggage Compartment Lid Release

The RKE feature provides luggage compartment lid release function independently of key position. The luggage compartment lid release button must be pressed twice within 3 seconds for the luggage compartment lid to release.

Panic Alarm

NOTE: The panic alarm activation can be configured using a scan tool from a single button press to press and hold. Refer to MODULE CONFIGURATION article.

The panic alarm feature provides audible and visual alarms which are evident from the exterior of the vehicle. The panic alarm feature requests that the turn signals are flashed and the horn sounds until deactivation. The flashing of the outputs occurs simultaneously. Activation of the panic alarm is accomplished by pressing the panic button on an integrated key head transmitter (IKT) whenever the key is in the OFF position. At all other times this feature is disabled. Deactivation of an active PANIC alarm is accomplished by any of the following actions:

- a second press of the IKT panic button
- the key is switched out of the OFF position
- a period of 2 minutes and 45 seconds has elapsed since the initial activation

Keyless Entry Keypad

The keyless entry keypad performs the following functions:

- Unlock the driver door
- Unlock all the doors
- Lock all doors
- Enables/disables auto-unlocking
- Enables/disables auto locking
- Arm/disarm the perimeter alarm (if equipped)

- Recall the memory seat position associated with a particular customer key code (when enabled)
- Release the luggage compartment lid latch
- Programs/erases the customer key code
- Illuminates the keyless entry keypad lamp and issues illuminated entry on/off requests

The keypad feature operates independently of key position status, vehicle speed, or transmission position. When a keypad button is pressed, the keypad buttons illuminate to provide better visibility. If the lock all doors command is entered or 5 seconds have elapsed since the last button press, the illumination is turned off.

Each vehicle equipped with a keypad is programmed with a 5-digit factory set entry code. This code is provided to the customer through a wallet card in the Owner's Literature. In addition, this code is available through a scan tool and is also printed on the SJB label. When entering codes each digit must be entered within 5 seconds of the previous button press.

Locking the Doors with the Keyless Entry Keypad System

It is not necessary to enter the factory set or personal code prior to locking all doors. To lock all doors, press the 7/8 and 9/0 controls at the same time.

Unlocking the Doors with the Keyless Entry Keypad System

To unlock the driver door, enter either the factory set code or a personal code; each digit must be pressed within 5 seconds of the prior digit. The interior lamps illuminate.

To unlock all doors, enter either the factory set code or a personal code (driver door unlocks) and press the 3/4 button within 5 seconds.

To open the luggage compartment, enter the factory set code or a personal code (driver door unlocks) and press the 5/6 button within 5 seconds.

Anti-Scan Feature

To provide added security, the keypad is disabled for 1 minute after 35 button presses without a valid entry code being entered. The keypad flashes during this 1-minute mode with all functionality disabled except for 7/8 and 9/0 still being allowed to lock the vehicle.

Anti-Scan is turned off after 1 minute of keypad inactivity.

Perimeter Lighting Feature

NOTE: **On vehicles with AUTOLAMPS, the perimeter lighting feature does not activate in daylight conditions.**

Vehicles equipped with perimeter lighting can have this feature activated or deactivated. For information on programming the perimeter lighting feature, refer to **Perimeter Lighting Feature Programming**.

The headlamps (Fusion, Milan), fog lamps (MKZ), park lamps, and tail lamps illuminate when the unlock control on the IKT is pressed. The perimeter lighting feature will turn off the interior lamps if:

- The ignition switch is turned to the ON position
- The IKT lock control is pressed
- The vehicle is locked using the keyless entry keypad (if equipped)
- After 25 seconds have elapsed since the perimeter lighting was activated

Door Lock Control Switch Inhibit

As a theft deterrent, the door lock control switches and the luggage compartment lid release switch can be disabled 20 seconds after the key is turned to the OFF position and the vehicle is locked using the RKE transmitter, the keyless entry keypad, or when the driver door is opened, and the power locks are locked with the door lock control switch, then the driver door is closed.

The door lock control switch is enabled when the vehicle is unlocked by one of the following methods:

- The keyless entry keypad
- The RKE transmitter
- Any door is opened from the vehicle's interior
- The key is turned to the ON position

The door lock control switch inhibit feature is configured off by default. To enable this feature, refer to the Owner's Literature.

DIAGNOSTIC TESTS

LOCKS, LATCHES AND ENTRY SYSTEMS

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
	Flex Probe Kit	105-R025C or equivalent

 ST2574-A		

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB receives inputs and delivers outputs to many of the electronically controlled features of the vehicle. The SJB constantly monitors the system under its control and reports a concern in the form of a DTC.

Power Door Locks - Without Memory

Regardless of the key position, the SJB is supplied voltage at all times. When the SJB receives a signal from the remote keyless entry (RKE) transmitter, the keyless entry keypad, or the door lock control switches, the SJB supplies a ground signal to the appropriate lock or unlock relay. The ground signal closes the relay which supplies voltage to the door lock actuators. The door lock actuators then actuate to a lock or unlock position.

Power Door Locks - With Memory

Regardless of the key position, the SJB and the driver door module (DDM) are supplied voltage at all times. When the SJB receives a signal from the RKE transmitter, the keyless entry keypad, or either door lock control switch, the SJB sends a command to the DDM, through the controller area network (CAN), and a ground signal to the lock and unlock relays. When the LH door lock control switch is pressed, the DDM receives the lock or unlock signal. The DDM will send a request through the CAN network to the SJB to lock or unlock the passenger doors. The SJB then responds to the DDM request, authorizing a lock or unlock of the driver door by the DDM. The DDM then supplies voltage and ground to the driver door lock actuator based on the lock or unlock request. The ground signal in the SJB closes the relay which supplies voltage to the remaining door lock actuators. The remaining door lock actuators then actuate to a lock or unlock position determined by the relay.

Luggage Compartment Lid Release

NOTE: When using the integrated key head transmitter (IKT), 2 presses of the luggage compartment lid release button (within 3 seconds) are required to release the luggage compartment lid.

The luggage compartment lid release system is inhibited when the vehicle speed exceeds 8 km/h (5 mph). The luggage compartment lid latch releases the luggage compartment lid when the customer requests it be opened using either the IKT, the keyless entry keypad, or the luggage compartment lid release switch. When the SJB receives a signal to release the luggage compartment lid, the SJB supplies voltage to the luggage compartment lid latch. The luggage compartment lid latch then actuates to release the luggage compartment lid.

Remote Keyless Entry (RKE)

The keyless entry keypad is hardwired to the SJB. The SJB interprets the inputs from the keyless entry keypad and then controls the associated operation. The keyless entry keypad is illuminated for 5 seconds when any button is pressed. The SJB requests the illuminated entry feature to turn the interior lamps on when a valid entry code is received. If a lock all doors code is entered, the illuminated entry feature turns off. If enabled, the perimeter lighting turns on when the RKE transmitter unlock command is activated. When an RKE transmitter or keyless entry keypad lock command is activated, the perimeter lighting is turned off.

NOTE: The keyless entry keypad does not lock the doors if the driver door is ajar.

Either the RKE transmitter or the keyless entry keypad supplies a signal to the SJB when pressed. The SJB then supplies voltage to the appropriate door lock actuator(s) to lock or unlock the doors. The keyless entry keypad or the RKE transmitter can also be used to release the luggage compartment lid. The RKE transmitter can also be used to activate the panic alarm. The panic alarm activation can be configured using a scan tool. It can be changed from a single button press, to press and hold. Refer to **MODULE CONFIGURATION** article. A single press will de-activate the panic alarm. On vehicles equipped with memory, the RKE transmitter also causes the SJB to send a CAN message to the driver seat module (DSM) to activate all memory features to the positions associated with the RKE transmitter being used.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Binding linkage • Misaligned door	• Smart junction box (SJB) fuse 16 (15A) • Door lock control switch • Door latch(es) • Luggage compartment lid latch • Luggage compartment lid release switch • Keyless entry keypad • Remote keyless entry (RKE) transmitter • Wiring, terminals or connectors • Driver door module (DDM) (if equipped) • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB, DDM and the instrument cluster (IC).
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

DRIVER DOOR MODULE (DDM) DTC CHART

B2425	Remote Keyless Entry Out of Synchronization	Go to **Pinpoint Test L**.
B2695	Keypad_A Switch Circuit Failure	Go to **Pinpoint Test J**.
B2696	Keypad_B Switch Circuit Failure	Go to **Pinpoint Test J**.
B2697	Keypad_C Switch Circuit Failure	Go to **Pinpoint Test J**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Fuse(s) • Wiring, terminals or connectors	• REFER to **MODULE COMMUNICATIONS NETWORK** article.

	• SJB	
• No communication with the driver door module (DDM)	• Fuse(s) • Wiring, terminals or connectors • DDM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the instrument cluster (IC)	• Fuse • Wiring, terminals or connectors • IC	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• All door locks are inoperative	• Fuse • Wiring, terminals or connectors • Luggage compartment lid release solenoid (part of the luggage compartment latch) • SJB	• Go to **Pinpoint Test A**.
• A single/more than one door lock is inoperative - without memory	• Wiring, terminals or connectors • Door lock actuator (part of the door latch) • SJB	• Go to **Pinpoint Test B**.
• A single/more than one door lock is inoperative - with memory	• Fuse • Wiring, terminals or connectors • Door lock actuator (part of the door latch) • Luggage compartment lid release solenoid (part of the luggage compartment latch) • DDM • SJB	• Go to **Pinpoint Test C**.
• All door locks are inoperative from one switch - without memory	• Wiring, terminals or connectors • Door lock control switch	• Go to **Pinpoint Test D**.

• All door locks are inoperative from one switch - with memory	• Wiring, terminals or connectors • Door lock control switch • DDM • SJB	• Go to **Pinpoint Test E**.
• The door lock switches operate only one way - without memory	• Wiring, terminals or connectors • Door lock control switch • SJB	• Go to **Pinpoint Test F**.
• The door lock switches operate only one way - with memory	• Wiring, terminals or connectors • Door lock control switch • DDM • SJB	• Go to **Pinpoint Test G**.
• The luggage compartment lid is inoperative/does not operate correctly	• Wiring, terminals or connectors • Luggage compartment lid release switch • Luggage compartment lid latch • SJB	• Go to **Pinpoint Test I**.
• The doors do not lock/unlock using the keyless entry keypad	• Wiring, terminals or connectors • Keyless entry keypad • SJB	• Go to **Pinpoint Test J**.
• The keyless entry keypad illumination is inoperative/does not operate correctly	• Wiring, terminals or connectors • Keyless entry keypad • SJB	• Go to **Pinpoint Test K**.
• The remote keyless entry (RKE) transmitter is inoperative	• Integrated key head transmitter (IKT) • IKT battery • IKT button pressed a substantial amount of times while outside the range of the	• Go to **Pinpoint Test L**.

	vehicle • IKT programming • SJB	
• An individual button/feature is inoperative from the remote keyless entry (RKE) transmitter	• Door locks • Horn system • Luggage compartment lid release • Turn signal system • IKT	• Go to **Pinpoint Test M**.
• The remote keyless entry (RKE) transmitter has poor range performance	• IKT • IKT battery • Aftermarket systems • High power devices • TV/radio transmission towers • SJB	• Go to **Pinpoint Test N**.
• The autolock does not operate correctly	• Ignition switch • Door ajar switches • Vehicle speed signal • Transmission range (TR) sensor • SJB	• Go to **Pinpoint Test O**.
• The auto-unlock does not operate correctly	• Door ajar switches • Ignition switch • Vehicle speed signal • SJB	• Go to **Pinpoint Test P**.
• The smart unlock does not operate correctly	• RH front door ajar switch • LH front door ajar switch • Key-in-ignition switch • SJB	• Go to **Pinpoint Test Q**.
• The memory seat does not operate correctly using the remote keyless entry (RKE) transmitter	• DDM • SJB	• ACTIVATE the remote memory. REFER to **Remote Memory Activation**. TEST the system for normal operation. If the remote memory is still inoperative, REFER

		to **SEATING** article to diagnose the memory seat.
• The remote keyless entry (RKE) two step door unlocking does not operate correctly	• Two step door unlocking is disabled	• PROGRAM the two step door unlocking. REFER to **Stepped Unlock Programming**. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: All Door Locks Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation - With Memory

The smart junction box (SJB) supplies voltage and ground to all the passenger door lock actuators by controlling the lock all and unlock all relays. The driver door module (DDM) supplies voltage and ground only to the driver door lock actuator. The SJB receives inputs from the RH door lock control switch, keyless entry keypad, and the remote keyless entry (RKE) transmitter. The DDM only receives input from the LH door lock control switch. Both modules share the information obtained from the inputs over the medium speed controller area network (MS-CAN). Upon a lock request, the SJB supplies voltage on circuit CPL11 (GY/BN) and ground on CPL52 (VT/GY), and the DDM supplies voltage on CPL02 (VT/GN) and ground on CPL51 (BU/GN). Upon an unlock request, the voltage and ground are reversed on the previously listed circuits.

Without Memory

The SJB supplies voltage to the lock all relay, the unlock driver door relay or unlock all relay based upon input from the door lock control switches, the RKE transmitter, or the keyless entry keypad. Upon a lock request, the SJB supplies voltage on circuit CPL11 (GY/BN) and ground on circuits CPL52 (VT/GY) and CPL51 (BU/GN). Upon an unlock request, the voltage and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals, or connectors
- Luggage compartment lid release solenoid (part of the luggage compartment latch)
- SJB

PINPOINT TEST A: ALL DOOR LOCKS ARE INOPERATIVE

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

A1 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES

- Press the lock and unlock button on both door lock control switches while observing the door lock operation.
- **Are the door locks inoperative from both switches?**

  YES : For vehicles equipped with memory, multiple failures exist if all locks are inoperative. CHECK the symptom and Go to **Symptom Chart**.

  For vehicles equipped without memory, go to A2.

  NO : Go to **Pinpoint Test D**.

A2 VERIFY ALL DOOR LOCKS ARE INOPERATIVE

- Press the lock and unlock buttons from a door lock control switch while observing the door locks.
- **Are all the door locks inoperative from both switch positions (lock and unlock)?**

  YES : VERIFY the SJB fuse 16 (15A) is OK. If OK, go to A3.

  If not OK, go to A4.

  NO : Go to **Symptom Chart**.

A3 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN

- Disconnect: LH Front Door Latch C525
- Disconnect: SJB C2280e

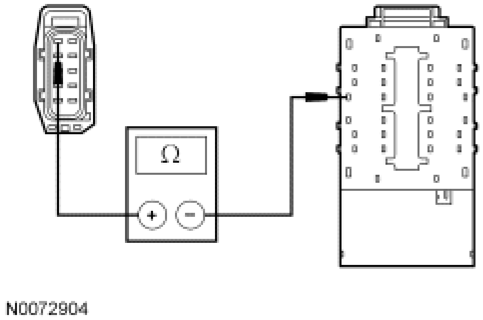

Fig. 2: Checking Circuit CPL11 (GY/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280e-17, circuit CPL11 (GY/BN), harness side and the LH front door latch C525-2, circuit CPL11 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A7.

  NO : REPAIR the circuit. TEST the system for normal operation.

A4 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO GROUND

- Install a new SJB fuse 16 (15A).
- Operate the luggage compartment lid release by pressing the luggage compartment lid release switch.

- **Is the SJB fuse 16 (15A) OK?**

  YES : Go to A6.

  NO : Go to A5.

A5 CHECK THE LUGGAGE COMPARTMENT LID RELEASE SOLENOID

- Install a new SJB fuse 16 (15A).
- Disconnect: Luggage Compartment Lid Release Solenoid C429
- Operate the luggage compartment lid release by pressing the luggage compartment lid release switch.
- **Is the SJB fuse 16 (15A) OK?**

  YES : INSTALL a new luggage compartment lid latch. REFER to **Luggage Compartment Lid Latch**.

  NO : REPAIR circuit CPL10 (GN/WH) for a short to ground. TEST the system for normal operation.

A6 CHECK CIRCUIT CPL11 (GY/BN) FOR A SHORT TO GROUND

- Operate the door lock actuators by pressing LOCK on the door lock control switch.
- **Is the SJB fuse 16 (15A) OK?**

  YES : REPAIR circuit CPL51 (BU/GN) or CPL52 (VT/GY) for a short to ground. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

A7 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: A Single/More Than One Door Lock Is Inoperative - Without Memory

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies voltage to the lock all relay, the unlock driver door relay or unlock all relay based upon input from the door lock control switches, the remote keyless entry (RKE) transmitter, or the keyless entry keypad. Upon a lock request, the SJB supplies voltage on circuit CPL11 (GY/BN) and ground on circuits CPL52 (VT/GY) and CPL51 (BU/GN). Upon an unlock request, the voltage and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock actuator (part of the door latch)
- SJB

PINPOINT TEST B: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE - WITHOUT MEMORY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Door Lock Actuator

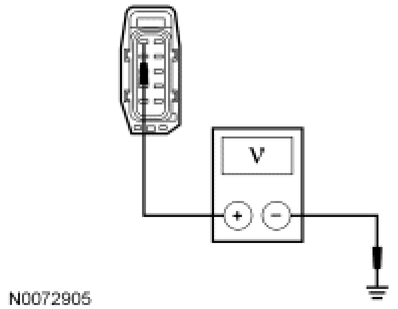

Fig. 3: Checking Circuit CPL11 (GY/BN) For An Open
Courtesy of FORD MOTOR CO.

NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.

- While pressing the door lock control switch in the LOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-2	CPL11 (GY/BN)

RH front	C603-2	CPL11 (GY/BN)
LH rear	C704-2	CPL11 (GY/BN)
RH rear	C804-2	CPL11 (GY/BN)

- **Is the voltage greater than 10 volts?**

  YES : Go to B2.

  NO : REPAIR the circuit. TEST the system for normal operation.

B2 CHECK CIRCUIT CPL52 (VT/GY) OR CIRCUIT CPL51 (BU/GN) FOR VOLTAGE

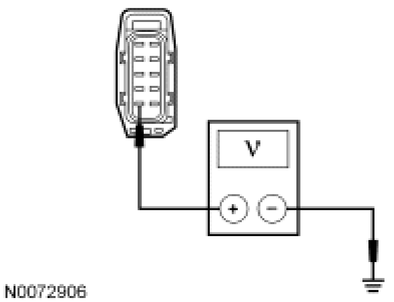

Fig. 4: Checking Circuit CPL52 (VT/GY) Or Circuit CPL51 (BU/GN) For Voltage
Courtesy of FORD MOTOR CO.

NOTE:	**The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.**

- While pressing the door lock control switch in the UNLOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-10	CPL51 (BU/GN)
RH front	C603-10	CPL52 (VT/GY)
LH rear	C704-10	CPL52 (VT/GY)
RH rear	C804-10	CPL52 (VT/GY)

- **Is the voltage greater than 10 volts?**

YES : INSTALL a new door latch for the door lock actuator in question. REFER to **Front Door Latch** or **Rear Door Latch**. TEST the system for normal operation.

NO : Go to B3.

B3 CHECK CIRCUIT CPL51 (BU/GN) OR CIRCUIT CPL52 (VT/GY) FOR AN OPEN

- Disconnect: SJB C2280e
- Measure the resistance between the inoperative door lock actuator, harness side and the SJB, harness side as follows:

Inoperative Door Lock Actuator Connector-Pin	SJB Connector-Pin	Circuit
LH front C525-10	C2280e-27	CPL51 (BU/GN)
RH front C603-10	C2280e-31	CPL52 (VT/GY)
LH rear C704-10	C2280e-31	CPL52 (VT/GY)
RH rear C804-10	C2280e-31	CPL52 (VT/GY)

- **Is the resistance less than 5 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit. TEST the system for normal operation.

B4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: A Single/More Than One Door Lock Is Inoperative - With Memory

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies voltage and ground to all the passenger door lock actuators by controlling the lock all and unlock all relays. The driver door module (DDM) supplies voltage and ground only to the driver door lock actuator. The SJB receives inputs from the RH door lock control switch, keyless entry keypad, and the remote keyless entry (RKE) transmitter. The DDM only receives input from the LH door lock control switch. Both modules share the information obtained from the inputs over the medium speed controller area network (MS-CAN). Upon a lock request, the SJB supplies voltage on circuit CPL11 (GY/BN) and ground on CPL52 (VT/GY), and the DDM supplies voltage on CPL02 (VT/GN) and ground on CPL51 (BU/GN). Upon an unlock request, the voltage and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Door lock actuator (part of the door latch)
- Luggage compartment lid release solenoid (part of the luggage compartment latch)
- DDM
- SJB

PINPOINT TEST C: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE - WITH MEMORY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK FOR COMMUNICATION WITH THE DDM AND SJB

- Enter the following diagnostic mode on the diagnostic tool: Network Test
- **Does the SJB or DDM fail the network test?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article.

  NO : Go to C2.

C2 CHECK THE PASSENGER DOOR LOCKS

- Key in OFF position.
- Operate the door locks from a door lock control switch.
- **Are all of the passenger door locks inoperative?**

  YES : VERIFY the SJB fuse 16 (15A) is OK. If OK, go to C3.

  If not OK, go to C5.

  NO : Go to C8.

C3 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN

- Disconnect: RH Front Door Latch C603
- Disconnect: SJB C2280e

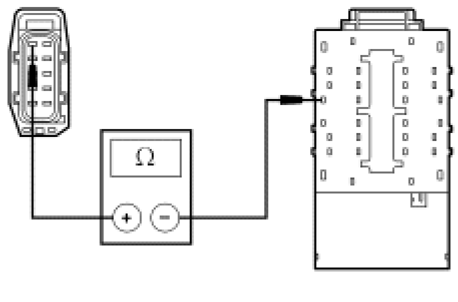

Fig. 5: Checking Circuit CPL11 (GY/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the RH front door latch C603-2, circuit CPL11 (GY/BN), harness side and the SJB C2280e-17, circuit CPL11 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C4.

  NO : REPAIR the circuit. TEST the system for normal operation.

C4 CHECK CIRCUIT CPL52 (VT/GY) FOR AN OPEN

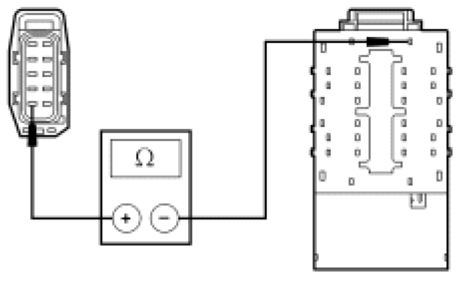

Fig. 6: Checking Circuit CPL52 (VT/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the RH front door latch C603-10, circuit CPL52 (VT/GY), harness side and the SJB C2280e-31, circuit CPL52 (VT/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C16.

  NO : REPAIR the circuit. TEST the system for normal operation.

C5 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO GROUND

- Install a new SJB fuse 16 (15A).
- Operate the luggage compartment lid release by pressing the luggage compartment lid release switch.

- **Is the SJB fuse 16 (15A) OK?**

  YES : Go to C7.

  NO : Go to C6.

C6 CHECK THE LUGGAGE COMPARTMENT LID RELEASE SOLENOID

- Install a new SJB fuse 16 (15A).
- Disconnect: Luggage Compartment Lid Release Solenoid C429
- Operate the luggage compartment lid release by pressing the luggage compartment lid release switch.
- **Is the SJB fuse 16 (15A) OK?**

  YES : INSTALL a new luggage compartment lid latch. REFER to **Luggage Compartment Lid Latch**.

  NO : REPAIR circuit CPL10 (GN/WH) for a short to ground. TEST the system for normal operation.

C7 CHECK CIRCUIT CPL11 (GY/BN) FOR A SHORT TO GROUND

- Operate the door lock actuators by pressing LOCK on the door lock control switch.
- **Is the SJB fuse 16 (15A) OK?**

  YES : REPAIR circuit CPL52 (VT/GY) for a short to ground. TEST the system for normal operation.

  NO : REPAIR circuit CPL11 (GY/BN) for a short to ground. TEST the system for normal operation.

C8 CHECK THE DRIVER DOOR LOCK

- Check to see if the driver door lock is the inoperative lock.
- **Is the driver door lock inoperative?**

  YES : Go to C9.

  NO : Go to C13.

C9 CHECK CIRCUIT CPL02 (VT/GN) FOR VOLTAGE

- Disconnect: LH Front Door Latch C525

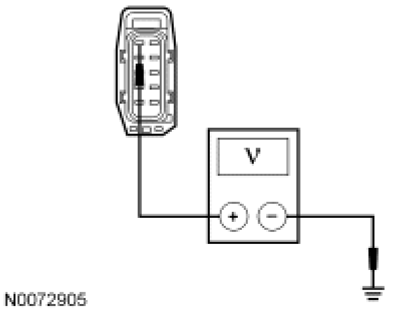

Fig. 7: Checking Circuit CPL02 (VT/GN) For Voltage
Courtesy of FORD MOTOR CO.

NOTE: **The SJB only supplies voltage to the actuator momentarily. It is**

important to monitor the meter while pressing the door lock control switch.

- While pressing the door lock control switch in the LOCK position, measure the voltage between the LH front door latch C525-2, circuit CPL02 (VT/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C10.

  NO : Go to C11.

C10 CHECK CIRCUIT CPL51 (BU/GN) FOR VOLTAGE

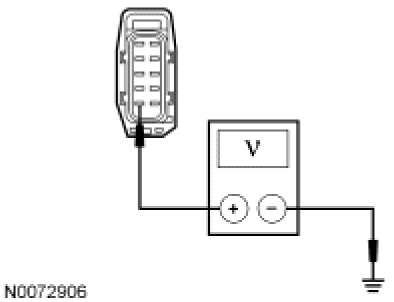

Fig. 8: Checking Circuit CPL51 (BU/GN) For Voltage
Courtesy of FORD MOTOR CO.

NOTE:	**The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.**

- While pressing the door lock control switch in the UNLOCK position, measure the voltage between the LH front door latch C525-10, circuit CPL51 (BU/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new driver door latch. REFER to **Front Door Latch**. TEST the system for normal operation.

  NO : Go to C12.

C11 CHECK CIRCUIT CPL02 (VT/GN) FOR AN OPEN OR A SHORT TO GROUND

- Disconnect: DDM C568b

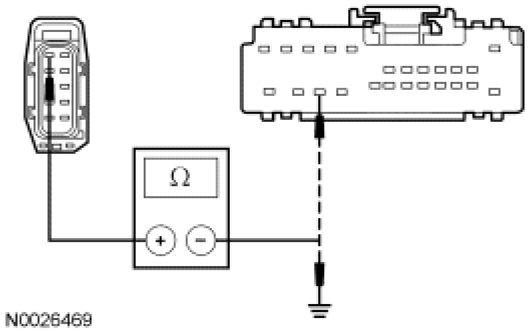

Fig. 9: Checking Circuit CPL02 (VT/GN) For Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH front door latch C525-2, circuit CPL02 (VT/GN), harness side and the DDM C568b-22, circuit CPL02 (VT/GN), harness side; and between the LH front door latch C525-2, circuit CPL02 (VT/GN), harness side and ground.
- **Is the resistance less than 5 ohms between the LH front door latch and the DDM, and greater than 10,000 ohms between the LH front door latch and ground?**

  YES : Go to C12.

  NO : REPAIR the circuit. TEST the system for normal operation.

C12 CHECK CIRCUIT CPL51 (BU/GN) FOR AN OPEN OR A SHORT TO GROUND

- Disconnect: DDM C568b

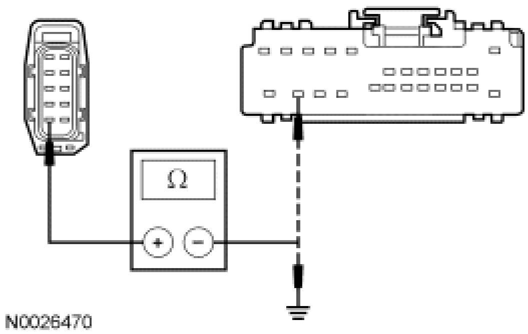

Fig. 10: Checking Circuit CPL51 (BU/GN) For Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH front door latch C525-10, circuit CPL51 (BU/GN), harness side and the DDM C568b-23, circuit CPL51 (BU/GN), harness side; and between the LH front door latch C525-10, circuit CPL51 (BU/GN), harness side and ground.
- **Is the resistance less than 5 ohms between the LH front door latch and the DDM, and greater than 10,000 ohms between the LH front door latch and ground?**

  YES : Go to C15.

  NO : REPAIR the circuit. TEST the system for normal operation.

C13 CHECK CIRCUIT CPL11 (GY/BN) FOR VOLTAGE

- Disconnect: Suspect Door Latch

NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.

- While pressing the door lock control switch in the LOCK position, measure the voltage between the suspect door latch and ground as follows:

Door Latch Connector-Pin	Circuit
C603-2 (RH front)	CPL11 (GY/BN)
C704-2 (LH rear)	CPL11 (GY/BN)
C804-2 (RH rear)	CPL11 (GY/BN)

- **Is the voltage greater than 10 volts?**

  YES : Go to C14.

  NO : REPAIR the circuit for an open. TEST the system for normal operation.

C14 CHECK CIRCUIT CPL52 (VT/GY) FOR VOLTAGE

NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.

- While pressing the door lock control switch in the UNLOCK position, measure the voltage between the suspect door latch and ground as follows:

Door Latch Connector-Pin	Circuit
C603-10 (RH front)	CPL52 (VT/GY)
C704-10 (LH rear)	CPL52 (VT/GY)
C804-10 (RH rear)	CPL52 (VT/GY)

- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new door latch for the door lock actuator in question. REFER to **Front Door Latch** or **Rear Door Latch**. TEST the system for normal operation.

NO : REPAIR the circuit for an open. TEST the system for normal operation.

C15 CHECK FOR CORRECT DDM OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

C16 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: All Door Locks Are Inoperative From One Switch - Without Memory

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground. The driver door lock control switch is grounded through circuit GD126 (BK/WH) and the passenger switch is grounded through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch

PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH - WITHOUT MEMORY

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

D1 CHECK CIRCUIT GD126 (BK/WH) OR GD139 (BK/YE) FOR AN OPEN

- Disconnect: Inoperative Door Lock Control Switch

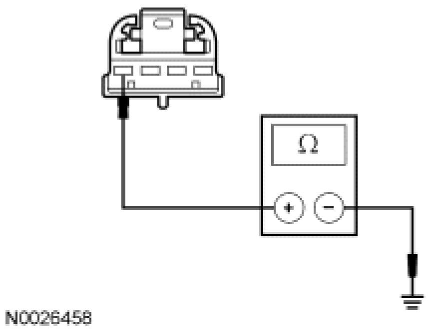

Fig. 11: Checking Circuit GD126 (BK/WH) OR GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the driver door lock control switch C505-4, circuit GD126 (BK/WH), harness side and ground; or between the passenger door lock control switch C605-4, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test E: All Door Locks Are Inoperative From One Switch - With Memory

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the passenger door lock control switch through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground.

The driver door module (DDM) sends voltage signals to the driver door lock control switch through circuits

CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground.

The driver door lock control switch is grounded through circuit GD126 (BK/WH) and the passenger switch is grounded through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- DDM
- SJB

PINPOINT TEST E: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH - WITH MEMORY

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

E1 CHECK THE RECORDED SJB AND DDM DTCs FROM ON-DEMAND SELF-TEST

- Check the recorded results from the SJB and DDM self-test.
- **Are any DTCs present?**

  YES : REFER to **DTC Charts**.

  NO : Go to E2.

E2 CHECK THE DRIVER DOOR LOCK CONTROL SWITCH

- Check to see if the driver door lock control switch is the inoperative switch.
- **Is the driver door lock control switch inoperative?**

  YES : Go to E3.

  NO : Go to E4.

E3 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Disconnect: Driver Door Lock Control Switch C505

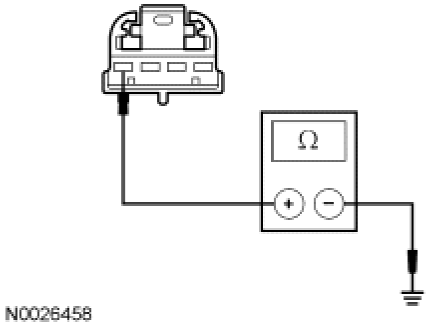

Fig. 12: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the driver door lock control switch C505-4, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit. TEST the system for normal operation.

E4 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Disconnect: Passenger Door Lock Control Switch C605

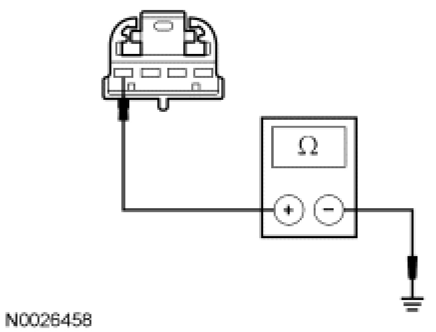

Fig. 13: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the passenger door lock control switch C605-4, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit. TEST the system for normal operation.

E5 CHECK THE SUSPECT DOOR LOCK CONTROL SWITCH FOR CORRECT OPERATION

- Carry out the door lock control switch component test. Refer to COMPONENT TESTING.
- **Is the door lock control switch OK?**

  YES : For an inoperative driver door lock control switch, go to E6.

  For an inoperative passenger door lock control switch, go to E7.

  NO : INSTALL a new door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

E6 CHECK THE DDM FOR CORRECT OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

E7 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Door Lock Switches Operate Only One Way - Without Memory

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground. The driver door lock control switch is grounded through circuit GD126 (BK/WH) and the passenger switch is grounded through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- SJB

PINPOINT TEST F: THE DOOR LOCK SWITCHES OPERATE ONLY ONE WAY - WITHOUT MEMORY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use

the correct probe adapter(s) may damage the connector.

F1 RETRIEVE THE RECORDED SJB DTCs FROM THE ON-DEMAND SELF-TEST

- Check for recorded SJB DTCs from the on-demand self-test.
- **Are any DTCs recorded?**

  YES : For DTC B1309 or B1341, go to **Pinpoint Test H**.

  For all other SJB DTCs, REFER to **DTC Charts**.

  NO : Go to F2.

F2 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES

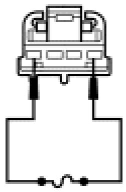
- Key in OFF position.
- Press the lock and unlock button of both door lock control switches while observing the door lock operation.
- **Do the door locks operate only one way from both switches?**

  YES : Go to F4.

  NO : Go to F3.

F3 CHECK CIRCUIT CPL42 (GY/YE) (LOCK INPUT) OR CIRCUIT CPL43 (VT/GY) (UNLOCK INPUT) FOR AN OPEN (SINGLE SWITCH INOPERATIVE)

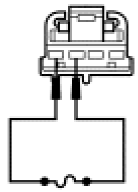
- Disconnect: Suspect Door Lock Control Switch
- Unlock the doors from the working door lock control switch.



N0062349

Fig. 14: Connecting Fused (5A) Jumper Wire Between LH Door Lock Control Switch C505-1, Circuit CPL42 (GY/YE)
Courtesy of FORD MOTOR CO.

- Observe the door locks while connecting a fused (5A) jumper wire between the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-4, circuit GD126 (BK/WH), harness side; or between the RH door lock control switch C605-1, circuit CPL42 (GY/YE), harness side and the RH door lock control switch C605-4, circuit GD139 (BK/YE), harness side.
- Remove the jumper wire.



N0072908

Fig. 15: Connecting Fused (5A) Jumper Wire Between LH Door Lock Control Switch C505-3, Circuit CPL43 (VT/GY)
Courtesy of FORD MOTOR CO.

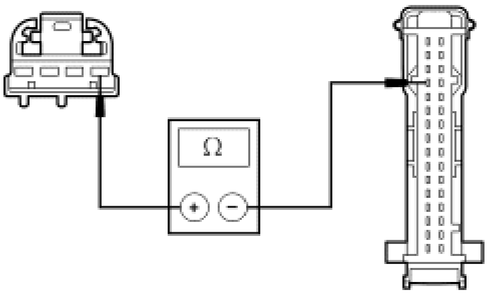
- Observe the door locks while connecting a fused (5A) jumper wire between the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-4, circuit GD126 (BK/WH), harness side; or between the RH door lock control switch C605-3, circuit CPL43 (VT/GY), harness side and the RH door lock control switch C605-4, circuit GD139 (BK/YE), harness side.
- **Do the doors lock and unlock with the jumper wire?**

  YES : INSTALL a new door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

  NO : REPAIR the input circuit in question. TEST the system for normal operation.

F4 CHECK CIRCUIT CPL42 (GY/YE) (LOCK INPUT) OR CIRCUIT CPL43 (VT/GY) (UNLOCK INPUT) FOR AN OPEN (BOTH SWITCHES INOPERATIVE)

- Disconnect: LH Door Lock Control Switch C505
- Disconnect: SJB C2280c



N0072909

Fig. 16: Measuring Resistance Between SJB C2280C-4, Circuit CPL42 (GY/YE) & LH Door Lock Control Switch C505-1
Courtesy of FORD MOTOR CO.

- If the doors do not lock, measure the resistance between the SJB C2280c-4, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side.

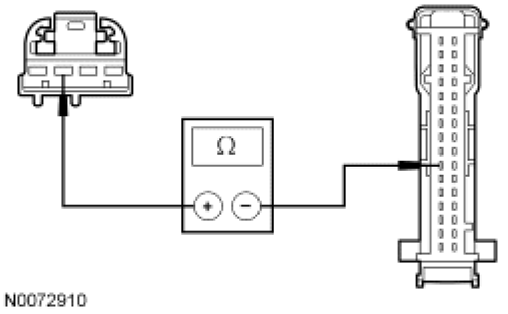


Fig. 17: Measuring Resistance Between SJB C2280C-10, Circuit CPL43 (VT/GY) & LH Door Lock Control Switch C505-3
Courtesy of FORD MOTOR CO.

- If the doors do not unlock, measure the resistance between the SJB C2280c-10, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F5.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

F5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Door Lock Switches Operate Only One Way - With Memory

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the passenger door lock control switch through circuits

CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground.

The driver door module (DDM) sends voltage signals to the driver door lock control switch through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the lock or unlock switch is pressed, the voltage signal is routed to ground.

The driver door lock control switch is grounded through circuit GD126 (BK/WH) and the passenger switch is grounded through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- DDM
- SJB

PINPOINT TEST G: THE DOOR LOCK SWITCHES OPERATE ONLY ONE WAY - WITH MEMORY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

G1 RETRIEVE THE RECORDED DDM AND SJB DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS

- Check for recorded DDM and SJB DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

  YES : For DDM DTC B2574 or B2575 and SJB DTC B1309 or B1341, go to **Pinpoint Test H**.

  For all other DTCs, REFER to **DTC Charts**.

  NO : Go to G2.

G2 CHECK THE SUSPECT DOOR LOCK CONTROL SWITCH FOR CORRECT OPERATION

- Disconnect: Inoperative Door Lock Control Switch
- Carry out the door lock control switch component test. Refer to COMPONENT TESTING.
- **Is the door lock control switch OK?**

  YES : If the driver door lock control switch was the switch tested, go to G3.

  If the passenger door lock control switch was the switch tested, go to G4.

  NO : INSTALL a new door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

G3 CHECK CIRCUITS CPL42 (GY/YE) AND CPL43 (VT/GY) FOR AN OPEN AT THE DDM

- Key in OFF position.
- Disconnect: DDM C568b

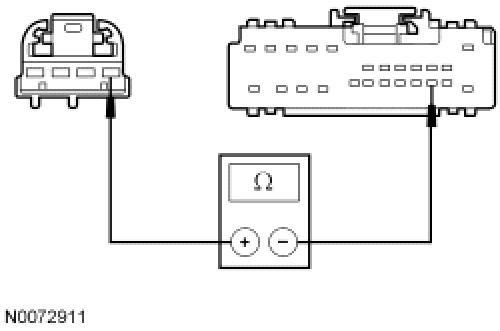

Fig. 18: Measuring Resistance Between DDM C568B-15, Circuit CPL42 (GY/YE) & LH Door Lock Control Switch C505-1
Courtesy of FORD MOTOR CO.

- If the doors do not lock, measure the resistance between the DDM C568b-15, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side.

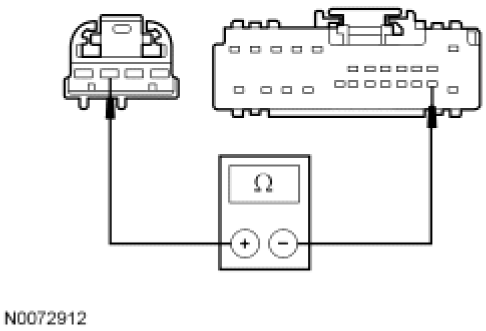

Fig. 19: Measuring Resistance Between DDM C568B-14, Circuit CPL43 (VT/GY) & LH Door Lock Control Switch C505-3
Courtesy of FORD MOTOR CO.

- If the doors do not unlock, measure the resistance between the DDM C568b-14, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to G5.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

G4 CHECK CIRCUITS CPL42 (GY/YE) AND CPL43 (VT/GY) FOR AN OPEN AT THE SJB

- Key in OFF position.
- Disconnect: SJB C2280c

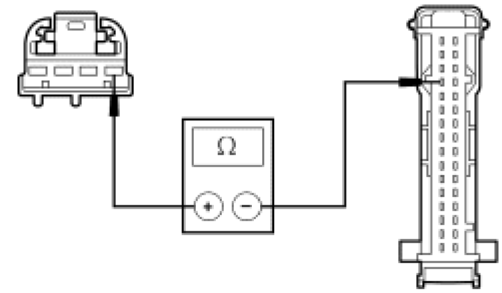

Fig. 20: Measuring Resistance Between SJB C2280C-4, Circuit CPL42 (GY/YE) & LH Door Lock Control Switch C505-1
Courtesy of FORD MOTOR CO.

- If the doors do not lock, measure the resistance between the SJB C2280c-4, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side.

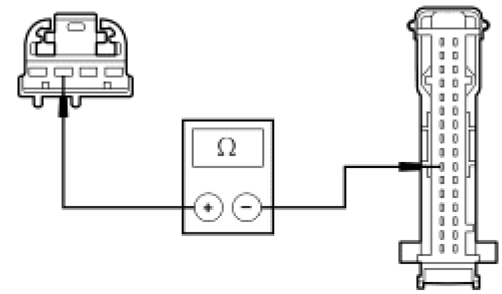

Fig. 21: Measuring Resistance Between SJB C2280C-10, Circuit CPL43 (VT/GY) & LH Door Lock Control Switch C505-3
Courtesy of FORD MOTOR CO.

- If the doors do not unlock, measure the resistance between the SJB C2280c-10, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to G6.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

G5 CHECK FOR CORRECT DDM OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

G6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: DTC B1309, B1341, B2574, or B2575: Lock/Unlock Circuit Short To Ground

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Normal Operation - With Memory

The smart junction box (SJB) supplies voltage and ground to all the passenger door lock actuators by controlling the lock all and unlock all relays. The driver door module (DDM) supplies voltage and ground only to the driver door lock actuator. The SJB receives inputs from the RH door lock control switch, keyless entry keypad, and the remote keyless entry (RKE) transmitter. The DDM only receives input from the LH door lock control switch. Both modules share the information obtained from the inputs over the medium speed controller area network (MS-CAN). Upon a lock request, the SJB supplies voltage on circuit CPL11 (GY/BN) and ground on CPL52 (VT/GY), and the DDM supplies voltage on CPL02 (VT/GN) and ground on CPL51 (BU/GN). Upon an unlock request, the voltage and ground are reversed on the previously listed circuits.

Without Memory

The SJB supplies voltage to the lock all relay, the unlock driver door relay or unlock all relay based upon input from the door lock control switches, the RKE transmitter, or the keyless entry keypad. Upon a lock request, the SJB supplies voltage on circuit CPL11 (GY/BN) and ground on circuits CPL52 (VT/GY) and CPL51 (BU/GN). Upon an unlock request, the voltage and ground are reversed on the previously listed circuits.

DTC Description	Fault Trigger Conditions
B1309 - Power Door Lock Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground on circuit CPL42 (GY/YE).
B1341 - Power Door Unlock Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground on circuit CPL43 (VT/GY).
B2574 - Drivers Door LOCK Switch Short to Ground	A continuous and on-demand DTC that sets when the DDM detects a short to ground on circuit CPL42 (GY/YE). This code will also set if the driver door lock control switch is pressed for longer than 2 minutes.
B2575 - Drivers Door UNLOCK Switch Short to Ground	A continuous and on-demand DTC that sets when the DDM detects a short to ground on circuit CPL43 (VT/GY). This code will also set if the driver door unlock control switch is pressed for longer than 2 minutes.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- DDM
- SJB

PINPOINT TEST H: DTC B1309, B1341, B2574, OR B2575: LOCK/UNLOCK CIRCUIT SHORT TO GROUND

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

H1 CHECK THE RECORDED SJB DTCs FROM ON-DEMAND SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B1309 or B1341 present?**

  YES : Go to H2.

  NO : Go to H5.

H2 CHECK THE RH DOOR LOCK CONTROL SWITCH - WITHOUT MEMORY

- Disconnect: RH Door Lock Control Switch C605
- Repeat the SJB on-demand self-test.
- **Is DTC B1309 or B1341 retrieved again?**

  YES : For vehicles without memory, LEAVE the switch disconnected. Go to H3.

  For vehicles with memory, LEAVE the switch disconnected. Go to H4.

  NO : INSTALL a new RH door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

H3 CHECK THE LH DOOR LOCK CONTROL SWITCH - WITHOUT MEMORY

- Disconnect: LH Door Lock Control Switch C505
- Repeat the SJB on-demand self-test.
- **Is DTC B1309 or B1341 retrieved again?**

  YES : LEAVE the switch disconnected. Go to H4.

  NO : INSTALL a new LH door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

H4 CHECK THE LOCK INPUT CIRCUIT OR THE UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND - WITHOUT MEMORY

- Key in OFF position.
- Disconnect: SJB C2280c

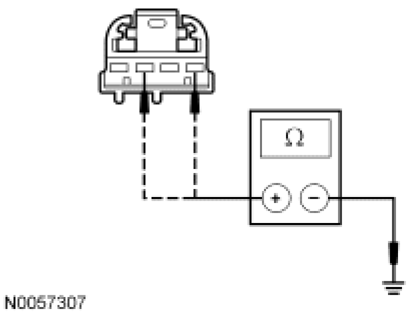

Fig. 22: Checking Lock Input Circuit Or Unlock Input Circuit For A Short To Ground - Without Memory
Courtesy of FORD MOTOR CO.

- Measure the resistance between the RH door lock control switch C605-1, circuit CPL42 (GY/YE), harness side and ground; and between the RH door lock control switch C605-3, circuit CPL43 (VT/GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to H8.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

H5 CHECK THE LH DOOR LOCK CONTROL SWITCH - WITH MEMORY

- Disconnect: LH Door Lock Control Switch C505
- Repeat the DDM on-demand self-test.
- **Is DTC B2574 or B2575 retrieved again?**

  YES : LEAVE the switch disconnected. Go to H6.

  NO : INSTALL a new LH door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

H6 CHECK THE LOCK INPUT CIRCUIT OR THE UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND - WITH MEMORY

- Key in OFF position.

- Disconnect: DDM C568B

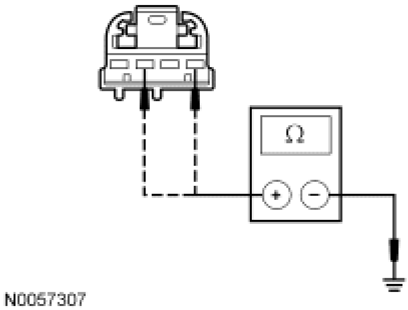

Fig. 23: Checking Lock Input Circuit Or Unlock Input Circuit For A Short To Ground - With Memory
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side and ground; and between the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to H7.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

H7 CHECK FOR CORRECT DDM OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

H8 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Luggage Compartment Lid Release Is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Luggage Compartment Lid Release for schematic and connector information.

Normal Operation

When the smart junction box (SJB) receives an open request from the luggage compartment lid switch on circuit CPL45 (BN), the SJB supplies voltage on circuit CPL10 (GN/WH) to the luggage compartment lid latch. The luggage compartment lid latch is grounded on circuit GD171 (BK/GY).

- DTC B1554 (Decklid Release Circuit Short to Ground) - is an on-demand DTC that sets if the SJB detects a short to ground on the luggage compartment lid release switch circuit CPL45 (BN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment lid release switch
- Luggage compartment lid latch
- SJB

PINPOINT TEST I: THE LUGGAGE COMPARTMENT LID RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

I1 CHECK THE DOOR LOCK OPERATION

- Lock and unlock the doors using a door lock control switch.
- **Do the door locks operate correctly?**

  YES : Go to I2.

  NO : Go to **Symptom Chart**.

I2 RETRIEVE THE RECORDED SJB DTCs FROM THE ON-DEMAND SELF-TEST

- Check for recorded SJB DTCs from the on-demand self-test.
- **Is DTC B1554 present?**

YES : Go to I3.

NO : Go to I5.

I3 REPEAT THE SJB ON-DEMAND SELF-TEST

- Disconnect: Luggage Compartment Lid Release Switch C2269
- Erase the DTCs, then repeat the SJB on-demand self-test.
- **Is DTC B1554 recorded?**

YES : Go to I4.

NO : INSTALL a new luggage compartment lid switch. CLEAR the DTCs. REPEAT the self-test.

I4 CHECK CIRCUIT CPL45 (BN) FOR A SHORT TO GROUND

- Disconnect: SJB C2280d

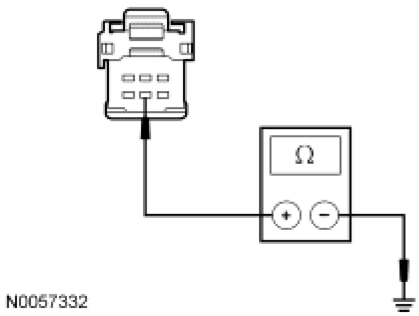

Fig. 24: Checking Circuit CPL45 (BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment lid release switch C2269-5, circuit CPL45 (BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to I14.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I5 CARRY OUT THE SJB LUGGAGE COMPARTMENT LID RELEASE ACTIVE COMMAND USING THE SCAN TOOL

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Select the SJB PID (DLIDOUT) and active command the luggage compartment lid to release.
- **Does the luggage compartment lid release?**

YES : Go to I6.

NO : Go to I9.

I6 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Disconnect: Luggage Compartment Lid Release Switch C2269

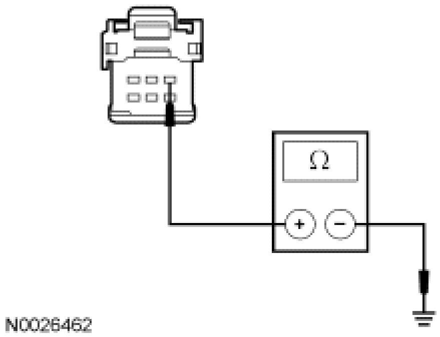

Fig. 25: Checking Circuit GD116 (BK/VT) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment lid release switch C2269-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to I7.

  NO : REPAIR the circuit. TEST the system for normal operation.

I7 CHECK THE LUGGAGE COMPARTMENT LID SWITCH

- Key in OFF position.
- Disconnect: Luggage Compartment Lid Release Switch C2269

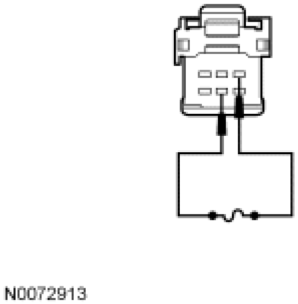

Fig. 26: Checking Luggage Compartment Lid Switch
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the luggage compartment lid release switch C2269-5, circuit CPL45 (BN), harness side and the luggage compartment lid release switch C2269-1, circuit GD116 (BK/VT), harness side.
- **Does the luggage compartment lid release?**

  YES : INSTALL a new luggage compartment lid switch. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to I8.

I8 CHECK CIRCUIT CPL45 (BN) FOR AN OPEN

- Disconnect: SJB C2280d

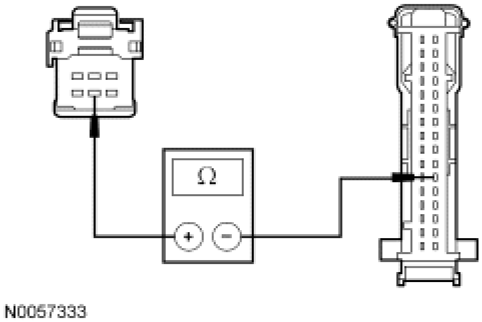

Fig. 27: Checking Circuit CPL45 (BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment lid switch C2269-5, circuit CPL45 (BN), harness side and the SJB C2280d-27, circuit CPL45 (BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I14.

  NO : REPAIR the circuit. TEST the system for normal operation.

I9 CHECK CIRCUIT GD171 (BK/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Luggage Compartment Lid Latch C429

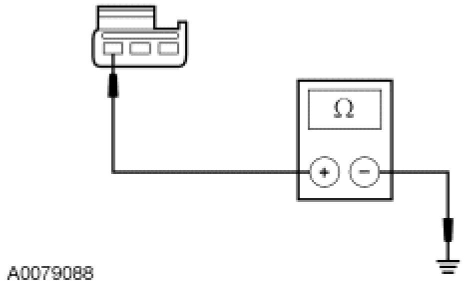

Fig. 28: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment lid latch C429-3, circuit GD171 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to I10.

  NO : REPAIR the circuit. TEST the system for normal operation.

I10 CHECK CIRCUIT CPL10 (GN/WH) FOR VOLTAGE

- Key in ON position.

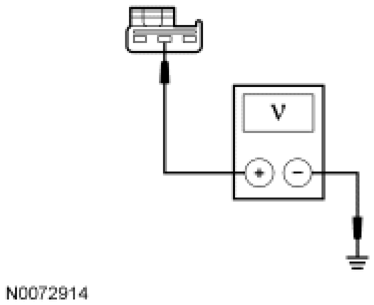

Fig. 29: Checking Circuit CPL10 (GN/WH) For Voltage
Courtesy of FORD MOTOR CO.

NOTE: Do not operate the luggage compartment lid release while performing this test.

- Measure the voltage between the luggage compartment lid latch C429-2, circuit CPL10 (GN/WH), harness side and ground.
- **Is any voltage present?**

  YES : Go to I11.

  NO : Go to I12.

I11 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280e

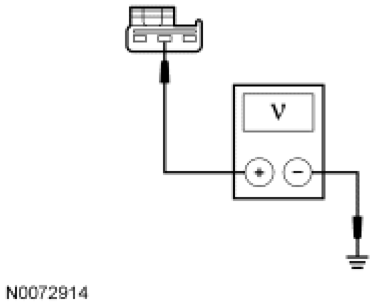

Fig. 30: Checking Circuit CPL10 (GN/WH) For A Short To Voltage
Courtesy of FORD MOTOR CO.

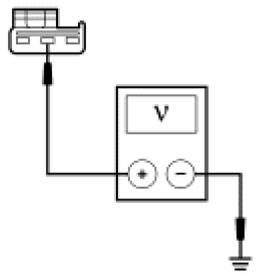
- Measure the voltage between the luggage compartment lid latch C429-2, circuit CPL10 (GN/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to I14.

I12 CHECK FOR VOLTAGE TO THE LUGGAGE COMPARTMENT LID RELEASE SOLENOID

- Unlock the doors with a door lock control switch.



N0072914

Fig. 31: Checking For Voltage To Luggage Compartment Lid Release Solenoid
Courtesy of FORD MOTOR CO.

NOTE: **The SJB only supplies voltage to the luggage compartment lid release solenoid momentarily. It is important to watch the meter while pressing the luggage compartment lid release switch.**

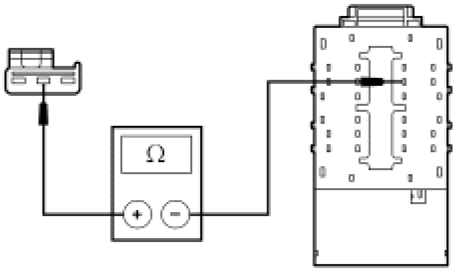
- While pressing the luggage compartment lid release switch, measure the voltage between the luggage compartment lid latch C429-2, circuit CPL10 (GN/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new luggage compartment lid latch. REFER to **Luggage Compartment Lid Latch**. TEST the system for normal operation.

  NO : Go to I13.

I13 CHECK CIRCUIT CPL10 (GN/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280e



N0072915

Fig. 32: Checking Circuit CPL10 (GN/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment lid latch C429-2, circuit CPL10 (GN/WH), harness side and the SJB C2280e-23, circuit CPL10 (GN/WH), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to I14.

NO : REPAIR the circuit. TEST the system for normal operation.

I14 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Doors Do Not Lock/Unlock Using The Keyless Entry Keypad

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors for a ground signal on the reference circuits CPK29 (GY/BU), CPK30 (VT/GN), and CPK31 (YE/GN) for the keyless entry keypad. When an individual keypad button is pressed, an individual or combination of the reference circuits is routed to ground. The SJB then determines which button was pressed based on which circuit(s) are grounded. The keypad is grounded through circuit GD126 (BK/WH). Once the SJB determines that the 5-digit personal entry code, or the factory set 5-digit entry code has been entered on the keypad, the SJB then energizes the driver door unlock relay to unlock the driver door.

To unlock all the doors, the 3/4 button must be pressed within 5 seconds of the 5-digit code being entered.

To release the luggage compartment lid, the 5/6 button must be pressed within 5 seconds of the 5-digit code being entered.

To lock all the doors, the 5-digit code does not need to be entered. Press the 7/8 and 9/0 buttons at the same time.

- DTC B2695 (Keypad_A Switch Circuit Failure) - is an on-demand DTC that sets when the SJB detects a short to ground on the keyless entry keypad switch A circuit CPK29 (GY/BU).
- DTC B2696 (Keypad_B Switch Circuit Failure) - is an on-demand DTC that sets when the SJB detects a short to ground on the keyless entry keypad switch B circuit CPK30 (VT/GN).

- DTC B2697 (Keypad_C Switch Circuit Failure) - is an on-demand DTC that sets when the SJB detects a short to ground on the keyless entry keypad switch C circuit CPK31 (YE/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Keyless entry keypad
- SJB

PINPOINT TEST J: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

J1 CHECK THE SJB KEYCODE PID

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Observe the SJB PID (KEYCODE). Read and record the 5-digit factory set entry code.
- Enter the 5-digit factory set entry code on the keyless entry keypad, then press the 3/4 button.
- **Do the doors unlock?**

  YES : The system is operating as designed. INFORM the customer of the correct system operation.

  NO : Go to J2.

J2 RETRIEVE THE RECORDED SJB DTCs FROM THE ON-DEMAND SELF-TEST

- Check for recorded SJB DTCs from the on-demand self-test.
- **Is DTC B2695, B2696, or B2697 recorded?**

  YES : Go to J3.

  NO : Go to J5.

J3 REPEAT THE SJB ON-DEMAND SELF-TEST

- Disconnect: Keyless Entry Keypad C530
- Clear the DTCs, then repeat the SJB on-demand self-test.
- **Is DTC B26956, B2696, or B2697 recorded?**

  YES : Go to J4.

  NO : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**. CLEAR the DTCs. REPEAT the self-test.

J4 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c
- Measure the resistance between the keypad, harness side and ground as follows:

Keypad Connector-	Circuit

Pin	
C530-7	CPK29 (GY/BU)
C530-5	CPK30 (VT/GN)
C530-1	CPK31 (YE/GN)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J10.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

J5 CHECK THE SJB KEY_PAD PID

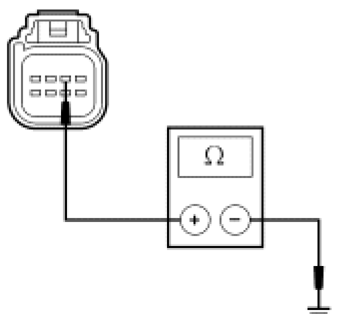
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Press each keyless entry keypad button while observing the SJB PID (KEY_PAD).
- **Does the PID display the correct values?**

  YES : Go to J10.

  NO : Go to J6.

J6 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: Keyless Entry Keypad C530



N0026472

Fig. 33: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C530-2, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to J7.

  NO : REPAIR the circuit. TEST the system for normal operation.

J7 CHECK THE KEYLESS ENTRY KEYPAD

- Connect a fused (5A) jumper wire between the keyless entry keypad harness side, while monitoring the SJB PID (KEY_PAD) as follows:

Keyless Entry Keypad Connector-Pin/ Circuit	Keyless Entry Keypad Connector-Pin/ Circuit	SJB PID (KEY_PAD) Value
C530-7 CPK29 (GY/BU)	C530-2 GD126 (BK/WH)	1/2
C530-5 CPK30 (VT/GN)	C530-2 GD126 (BK/WH)	7/8
C530-1 CPK31 (YE/GN)	C530-2 GD126 (BK/WH)	9/0

- **Does the PID display the correct values?**

  YES : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**.

  NO : Go to J8.

J8 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR AN OPEN

- Disconnect: SJB C2280c
- Measure the resistance between the SJB, harness side and the keyless entry keypad, harness side as follows:

SJB Connector-Pin	Circuit	Keyless Entry Keypad Connector-Pin
C2280c-15	CPK29 (GY/BU)	C530-7
C2280c-16	CPK30 (VT/GN)	C530-5
C2280c-21	CPK31 (YE/GN)	C530-1

- **Are the resistances less than 5 ohms?**

  YES : Go to J9.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

J9 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO EACH OTHER

- Measure the resistance between the keypad, harness side as follows:

Keypad Connector-Pin	Circuits	Keypad Connector-Pin
C530-7	CPK29 (GY/BU) and CPK30 (VT/GN)	C530-5
C530-7	CPK29 (GY/BU) and CPK31 (YE/GN)	C530-1
C530-5	CPK30 (VT/GN) and CPK31 (YE/GN)	C530-1

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J10.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

J10 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The Keyless Entry Keypad Illumination Is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When any keypad button is pressed the smart junction box (SJB) sends power to the keyless entry keypad lamps on circuit CPK28 (WH) to assist the driver in entering an access code at night. The keyless entry keypad is grounded on circuit GD126 (BK/WH).

- DTC B1623 (Lamp Keypad Output Circuit Failure) - is a continuous DTC that sets if the SJB detects a short to ground on the keyless entry keypad illumination circuit CPK28 (WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Keyless entry keypad
- SJB

PINPOINT TEST K: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

K1 CHECK THE KEYLESS ENTRY KEYPAD OPERATION

- Enter the security code to unlock the driver door.
- **Does the driver door unlock using the keyless entry keypad?**

  YES : Go to K2.

  NO : Go to **Pinpoint Test J**.

K2 CHECK THE RECORDED SJB DTCs FROM THE ON-DEMAND SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B1623 present?**

  YES : Go to K3.

  NO : Go to K5.

K3 CHECK THE KEYLESS ENTRY KEYPAD FOR A SHORT TO GROUND

- Disconnect: Keyless Entry Keypad C530
- Clear the DTCs, then repeat the SJB on-demand self-test.
- **Is DTC B1623 recorded?**

  YES : Go to K4.

  NO : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**. TEST the system for normal operation.

K4 CHECK CIRCUIT CPK28 (WH/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c

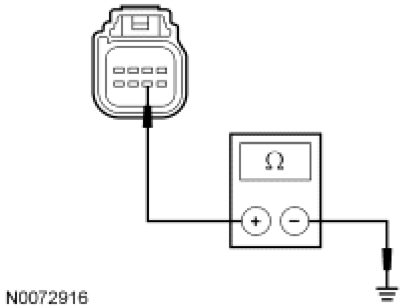


Fig. 34: Checking Circuit CPK28 (WH/GN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C530-6, circuit CPK28 (WH/GN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to K9.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

K5 CHECK THE KEYLESS ENTRY KEYPAD ILLUMINATION

- Key in OFF position.
- Check the keyless entry keypad illumination.
- **Is the keyless entry keypad illumination always on?**

  YES : Go to K6.

  NO : Go to K7.

K6 CHECK CIRCUIT CPK28 (WH/GN) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280c
- Key in ON position.
- Observe the keypad illumination.
- **Is the keypad still illuminated?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to K9.

K7 CHECK FOR SJB OUTPUT

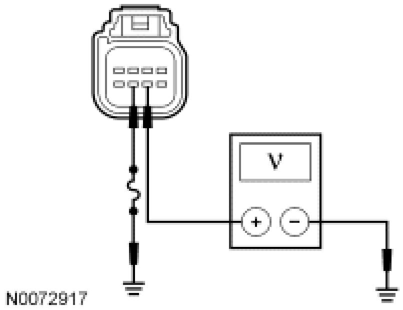

Fig. 35: Checking For SJB Output
Courtesy of FORD MOTOR CO.

- Measure the voltage between the keyless entry keypad C530-6, circuit CPK28 (WH/GN), harness side and ground while connecting a fused (5A) jumper wire between the keyless entry keypad C530-7, circuit CPK29 (GY/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**. TEST the system for normal operation.

  NO : Go to K8.

K8 CHECK CIRCUIT CPK28 (WH/GN) FOR AN OPEN

- Disconnect: SJB C2280c

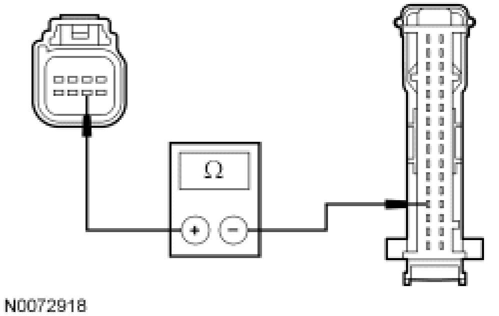

Fig. 36: Checking Circuit CPK28 (WH/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C530-6, circuit CPK28 (WH/GN), harness side and the SJB C2280c-13, circuit CPK28 (WH/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to K9.

  NO : REPAIR the circuit. TEST the system for normal operation.

K9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Remote Keyless Entry (RKE) Transmitter Is Inoperative

Normal Operation

Remote locking and unlocking of the doors, releasing the luggage compartment lid, and activating the panic alarm is accomplished by the smart junction box (SJB) receiving a command message from the RKE integrated key head transmitter (IKT). The IKTs and SJB also utilize a rolling code to prevent the code from being "captured" by a code grabber. The system advances the counter in the RKE transmitter and SJB every time an IKT button is pressed.

- DTC B1139 (Invalid Transmitter Identification Code) - is a continuous DTC that sets when the SJB detects an invalid TIC from an IKT.
- DTC B2425 (Remote Keyless Entry Out of Synchronization) - is a continuous DTC that sets when the SJB detects the rolling counter received from an RKE transmitter is 1,024 times greater than the rolling counter stored in the module.

This pinpoint test is intended to diagnose the following:

- IKT
- IKT battery
- IKT button pressed a substantial amount of times while outside the range of the vehicle
- IKT programming
- SJB

PINPOINT TEST L: THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER IS INOPERATIVE

NOTE: All IKT transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.

L1 CHECK FOR THE CORRECT RKE TRANSMITTERS

NOTE: Make sure the IKTs are those provided with the original equipment manufacturer (OEM) system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle.

- Check that the correct IKTs are used with the vehicle.
- **Are all the correct IKTs present?**

  YES : Go to L2.

  NO : The system cannot be tested without the correct IKTs. INFORM the customer that all the

correct IKTs must be present to proceed with diagnosis of the system.

L2 CHECK THE RECORDED SJB AND INSTRUMENT CLUSTER (IC) DTCs FROM THE ON-DEMAND SELF-TEST

- Check the recorded results from the SJB and IC self-test.
- **Is DTC B2425 or B1137 recorded?**

  YES : For DTC B2425, go to L3.

  For DTC B1137, go to **Pinpoint Test R**.

  NO : Go to L4.

L3 RE-SYNCHRONIZE THE INOPERATIVE IKT

- Key in OFF position.
- Key in ON position.
- Leave the IKT key in the ON position for a minimum of 6 seconds.
- Key in OFF position.
- Press any button on the IKT.
- **Does the IKT operate?**

  YES : The system is OK. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to L4.

L4 MAKE SURE THE RKE TRANSMITTER SIGNAL IS BEING RECEIVED

- Enter the following diagnostic mode on the diagnostic tool: Remote Keyless Entry

NOTE: The remote keyless entry test is accessed through the scan tool by selecting Toolbox, Body, Security.

- Monitor the RKE transmitter identification code (TIC) through the scan tool menus.
- Verify the RKE transmitter signal is being received. Using a scan tool, press a button on the RKE transmitter while observing the scan tool.
- **Does the TIC show up on the scan tool screen when a button is pressed?**

  YES : Go to L5.

  NO : Go to L6.

L5 CHECK IF THE RKE TRANSMITTERS ARE PROGRAMMED

- Enter the following diagnostic mode on the diagnostic tool: Remote Keyless Entry
- Monitor the RKE TIC through the scan tool menus.
- Compare the TIC received from the RKE transmitter with the TICs stored in memory.
- **Does the TIC displayed match any of the TICs stored in memory?**

  YES : Go to L7.

  NO : PROGRAM all of the IKTs. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation.

L6 CHECK THE IKT BATTERY

- Using a thin coin, open the IKT.
- Do not clean off any grease from the battery terminals on the back surface of the circuit board.
- Verify the correct battery is used (CR2032).
- Remove the IKT battery and measure the voltage.
- **Is the voltage greater than 2.5 volts?**

  YES : Go to L7.

  NO : INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the IKT (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.

L7 CHECK FOR NORMAL OPERATION WITH A KNOWN GOOD IKT

- Enter the following diagnostic mode on the diagnostic tool: Remote Keyless Entry
- Monitor the RKE TIC through the scan tool menus.
- Using the customer's second RKE transmitter, or a known good RKE transmitter that is correct for the vehicle, verify the RKE transmitter signal is being received by the SJB.
- **Does the TIC show up on the scan tool when a button is pressed?**

  YES : REPLACE the inoperative IKT. PROGRAM the new IKT. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. TEST the system for normal operation.

  NO : Go to L8.

L8 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: An Individual Button/Feature Is Inoperative From The Remote Keyless Entry (RKE) Transmitter

Normal Operation

When any integrated key head transmitter (IKT) button is pressed, the SJB receives and processes the command to provide the appropriate output.

This pinpoint test is intended to diagnose the following:

- Door locks
- Horn system
- Luggage compartment lid release
- Turn signal system
- IKT

PINPOINT TEST M: AN INDIVIDUAL BUTTON/FEATURE IS INOPERATIVE FROM THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

NOTE: **The panic feature will only operate when the key is in the OFF or LOCK positions.**

M1 VERIFY THE DOOR LOCK OPERATION

- Press the lock and unlock button on the driver door lock control switch while observing the door lock operation.
- **Do the door locks operate correctly?**

  YES : Go to M2.

  NO : Go to **Symptom Chart**.

M2 VERIFY THE HORN OPERATION

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Select the SJB PID (HORNRLY) and active command the horn on.
- **Does the horn sound when commanded on?**

  YES : Go to M3.

  NO : REFER to **HORN** article.

M3 VERIFY THE HAZARD LAMP OPERATION

- Place the hazard switch in the ON position.
- **Do the hazard lamps operate correctly?**

  YES : Go to M4.

  NO : REFER to **EXTERIOR LIGHTING** article.

M4 VERIFY THE LUGGAGE COMPARTMENT LID RELEASE OPERATION

- Press the luggage compartment lid release button, located next to the headlamp switch.
- **Does the luggage compartment lid release?**

  YES : REPLACE the inoperative IKT and PROGRAM all of the IKTs. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation.

  NO : Go to **Symptom Chart**.

Pinpoint Test N: The Remote Keyless Entry (RKE) Transmitter Has Poor Range Performance

Normal Operation

The RKE transmitter sends a radio signal to the smart junction box (SJB) based on the user selected RKE transmitter button. The SJB then carries out the selected action.

This pinpoint test is intended to diagnose the following:

- IKT
- IKT battery
- Aftermarket systems
- High power devices
- TV/radio transmission towers
- SJB

PINPOINT TEST N: THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER HAS POOR RANGE PERFORMANCE

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems may adversely affect RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.

N1 CHECK FOR THE CORRECT RKE TRANSMITTERS

NOTE: Make sure the RKE transmitters are those provided with the original equipment manufacturer (OEM) system and not from an aftermarket system or a dealer-installed system.

- Check that the correct RKE transmitters are used with the vehicle.
- **Are all the correct RKE transmitters present?**

YES : Go to N2.

NO : The system cannot be tested without the correct RKE transmitters. INFORM the customer that all the correct RKE transmitters must be present to proceed with diagnosis of the system.

N2 CHECK ALL THE RKE TRANSMITTERS FOR POOR RANGE PERFORMANCE

NOTE: The 10 m (33 ft) measurement of range is not the standard but is a guideline that clearly indicates a vehicle is experiencing poor range performance.

- Check all the RKE transmitters for poor range performance (less than 10 m [33 ft]).
- **Do all RKE transmitters experience poor range?**

YES : Go to N4.

NO : Go to N3.

N3 CHECK THE IKT BATTERY

- Using a thin coin, open the IKT.

- Do not clean off any grease from the battery terminals on the back surface of the circuit board.
- Verify the correct battery is used (CR2032).
- Remove the IKT battery and measure the voltage.
- **Is the voltage greater than 2.5 volts?**

  YES : REPLACE the inoperative integrated key and PROGRAM all the integrated keys. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.

  NO : INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the IKT (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.

N4 CHECK THE LOCATION OF THE VEHICLE AND THE APPROACH ANGLES AROUND THE VEHICLE

- Make sure the poor performance is consistent in nature and is not from one approaching angle.
- The RKE transmitter range performance may be degraded in certain locations. For example, if the vehicle is within 0.8 km (0.5 miles) of high-power devices or radio/TV towers, the operating distance of the RKE transmitters may be reduced.
- **Is the poor range performance consistent around the vehicle?**

  YES : Go to N5.

  NO : The system is operating correctly at this time. TEST the system for normal operation.

N5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Autolock Does Not Operate Correctly

Normal Operation

The smart junction box (SJB) energizes the lock relay based upon input from the ajar switches, the transmission range (TR) sensor, and the vehicle speed signal. The SJB locks the doors when the following conditions are met:

- All the doors are closed
- The ignition switch is in the ON position
- The vehicle is shifted into any gear putting the vehicle in motion
- The vehicle attains a speed greater than 20 km/h (12 mph) for longer than 2 seconds

NOTE: The autolock feature is not available on vehicles equipped with a manual transmission.

This pinpoint test is intended to diagnose the following:

- Ignition switch
- Door ajar switches
- Vehicle speed signal
- TR sensor
- SJB

PINPOINT TEST O: THE AUTOLOCK DOES NOT OPERATE CORRECTLY

O1 CHECK THE AUTO LOCKS CONFIGURATION

- Check to see if the auto locks are enabled. REFER to **Autolock and Horn Chirp Programming**.
- **Are the auto locks enabled?**

  YES : Go to O2.

  NO : ENABLE the auto locks. REFER to **Autolock and Horn Chirp Programming**. TEST the system for normal operation.

O2 CHECK THE COURTESY LAMP OPERATION

- Open and close each door while observing the courtesy lamp operation.
- **Do the courtesy lamps operate correctly?**

  YES : Go to O3.

  NO : REFER to **INTERIOR LIGHTING** article.

O3 CHECK THE SJB IGNITION STATUS PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB PID (IGN_SW).
- **Does the ignition status PID indicate ON?**

  YES : Go to O4.

  NO : REFER to **STEERING COLUMN SWITCHES** article to continue diagnosis of the ignition switch.

O4 CHECK THE VEHICLE SPEED OPERATION

- Check the operation of the speedometer.
- **Does the speedometer operate correctly?**

YES : Go to O5.

NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

O5 CHECK THE TRANSMISSION RANGE SENSOR PID

- Select DRIVE.
- Enter the following diagnostic mode on the diagnostic tool: TCM DataLogger
- Monitor the transmission control module (TCM) transmission range (TR) sensor PID.
- **Does the TCM TR sensor PID display the correct value?**

  YES : Go to O6.

  NO : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article to continue diagnosis of the TR sensor.

O6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: The Auto-Unlock Does Not Operate Correctly

Normal Operation

The smart junction box (SJB) energizes the unlock relay based upon input from the ajar switches and the vehicle speed signal. The SJB unlocks the doors when the following conditions are met:

- The vehicle speed has exceeded 20 km/h (12 mph) then dropped to 0 km/h (0 mph) (vehicle stopped).
- The key is turned to the OFF or ACCY position.
- The LH front door is opened within 10 minutes of the key being turned to the OFF or ACCY position.

This pinpoint test is intended to diagnose the following:

- Door ajar switches
- Ignition switch

- Vehicle speed signal
- SJB

PINPOINT TEST P: THE AUTO-UNLOCK DOES NOT OPERATE CORRECTLY

P1 CHECK THE AUTO-UNLOCK CONFIGURATION

- Check to see if the auto-unlock is enabled. REFER to **Autolock and Horn Chirp Programming**.
- **Is auto-unlock enabled?**

  YES : Go to P2.

  NO : ENABLE auto-unlock. REFER to **Autolock and Horn Chirp Programming**. TEST the system for normal operation.

P2 CHECK THE COURTESY LAMP OPERATION

- Open and close each door while observing the courtesy lamp operation.
- **Do the courtesy lamps operate correctly?**

  YES : Go to P3.

  NO : REFER to **INTERIOR LIGHTING** article.

P3 CHECK THE SJB IGNITION STATUS PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB PID (IGN_SW).
- **Does the ignition status PID indicate ON?**

  YES : Go to P4.

  NO : REFER to **STEERING COLUMN SWITCHES** article to continue diagnosis of the ignition switch.

P4 CHECK THE VEHICLE SPEED OPERATION

- Check the operation of the speedometer.
- **Does the speedometer operate correctly?**

  YES : Go to P5.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

P5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Q: The Smart Unlock Does Not Operate Correctly

Normal Operation

The smart junction box (SJB) commands all doors to unlock based on input from the key-in-ignition switch and door ajar signal. The feature helps prevent the keys from being locked in the vehicle by unlocking the doors if the key is in the ignition and either front door is ajar.

The vehicle can still be locked with the key in the ignition, by using the manual lock rod, a key in the door lock cylinder, keyless entry keypad, or the LOCK button on a integrated key head transmitter (IKT).

This pinpoint test is intended to diagnose the following:

- LH front door ajar switch
- RH front door ajar switch
- Key-in-ignition switch
- SJB

PINPOINT TEST Q: THE SMART UNLOCK DOES NOT OPERATE CORRECTLY

Q1 CHECK THE COURTESY LAMP OPERATION

- Open and close each door while checking the courtesy lamp operation.
- **Do the courtesy lamps operate correctly?**

YES : Go to Q2.

NO : REFER to **INTERIOR LIGHTING** article.

Q2 CHECK THE KEY-IN-IGNITION CHIME

- Insert the key in the ignition switch.
- Open the driver door.
- **Does the key-in-ignition chime operate correctly?**

YES : Go to Q3.

NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

Q3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins

    - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test R: DTC B1137 - Data Not Programmed

Normal Operation

When an integrated key head transmitter (IKT) key is programmed, the remote keyless entry (RKE) transmitter identification code (TIC) data from the key is received by the instrument cluster (IC). The IC then sends the TIC data to the smart junction box (SJB) over the medium speed controller area network (MS-CAN). The SJB stores the TIC data in memory and sends an acknowledgment back to the IC that the TIC data was successfully programmed.

- DTC B1137 (Data Not Programmed) - is a continuous DTC that sets when the IC sends the RKE TIC data to the SJB over the MS-CAN network, and it does not receive a response from the SJB that the TIC data has been stored.

This pinpoint test is intended to diagnose the following:

- IKT programming
- MS-CAN network
- SJB

PINPOINT TEST R: DTC B1137 - DATA NOT PROGRAMMED

R1 CHECK FOR THE CORRECT RKE TRANSMITTERS

NOTE: **Make sure the IKTs are those provided with the original equipment manufacturer (OEM) system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle.**

- Check that the correct IKTs are used with the vehicle.
- **Are all the correct IKTs present?**

  YES : Go to R2.

  NO : The system cannot be tested without the correct IKTs. INFORM the customer that all the correct IKTs must be present to proceed with diagnosis of the system.

R2 CHECK FOR COMMUNICATION WITH THE IC AND SJB

- Enter the following diagnostic mode on the diagnostic tool: Network Test
- **Does the IC or SJB fail the network test?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article.

  NO : Go to R3.

R3 REPROGRAM THE IKT KEYS

- Erase and program all of the IKT keys using the scan tool method. Refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
- Erase all IC DTCs.
- Enter the following diagnostic mode on the diagnostic tool: IC Self-Test
- **Is DTC B1137 retrieved again?**

  YES : Go to R5.

  NO : Go to R4.

R4 CHECK THE OPERATION OF THE RKE TRANSMITTER

- Press any button on the suspect IKT key.
- **Does the RKE transmitter operate?**

  YES : The system is operating normally. The concern may have been caused by an improperly programmed IKT key.

  NO : Go to **Pinpoint Test L**.

R5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each IKT key to the ON position for a minimum of 6 seconds to program the RKE function of the integrated keys. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

GENERAL PROCEDURES

REMOTE KEYLESS ENTRY TRANSMITTER PROGRAMMING

NOTE:	**This procedure is for programming conventional keyfobs only. The Remote Keyless Entry (RKE) transmitter of the Integrated Keyhead Transmitter (IKT) is programmed automatically during Passive Anti-Theft System (PATS)**

programming. For additional information, refer to Key Programming Using Two Programmed Keys or Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) article to program the IKT.

NOTE: All RKE transmitters must be programmed at the same time.

NOTE: Do not apply the brake pedal during this sequencing, as doing so ends the sequence and the transmitters will not be programmed.

1. Electronically unlock the door locks using the door lock control switch.
2. Cycle the ignition switch from the OFF to the ON position 8 times in rapid succession (within 10 seconds), with the eighth turn ending in ON. If the module successfully enters program mode, it locks and then unlocks all the doors.

   NOTE: If no action is taken within 20 seconds after a transmitter has been programmed, the programming sequence ends (the doors lock and unlock to confirm that programming is complete).

3. Within 20 seconds, press any button on the RKE transmitter to be programmed. The doors lock and then unlock to confirm that each RKE transmitter is programmed. Repeat this step for each RKE transmitter.
4. Exiting the programming mode is accomplished if one of the following occurs:
   - The key transitions to the OFF position.
   - 20 seconds have passed since entering programming mode or since the last RKE transmitter was programmed.
   - The maximum number (6) of RKE transmitters have been programmed.
5. Check the operation of the transmitter. If the door locks do not respond for the programmed RKE transmitter(s), wait several seconds and press the button again. If the door locks still fail to respond, check the operation of the door locks using an IKT. If the door locks fail to respond with an IKT, refer to **Locks, Latches and Entry Systems**. (Make sure that no more than the maximum number of RKE transmitters (6) are attempted to be programmed.)

KEYLESS ENTRY KEYPAD CODE PROGRAMMING

NOTE: To associate a memory configuration to a personal entry code, refer to the Owner's Literature.

1. Enter the permanent factory keyless entry keypad code.

   NOTE: Holding the 1/2 button for more than 2 seconds after activation erases all the customer codes. The existing code does not need to be erased to program a new code.

2. Press the 1/2 button within 5 seconds to activate the programming mode.

3. Within 5 seconds, enter the new 5-digit keyless entry keypad code. The doors lock and unlock to confirm the new code is programmed.

REMOTE MEMORY ACTIVATION

1. Position the driver seat and mirrors to the desired position.
2. Press the set button on the driver door panel.
3. Within 5 seconds press the 1 or 2 button on the driver door panel. This stores the configuration for driver 1 or driver 2.
4. Press the set button.
5. Within 5 seconds, press any button on the Integrated Keyhead Transmitter (IKT) and then press the 1 or 2 button on the driver door panel to associate the IKT with that position.
6. If a second memory setting is desired, repeat the procedure with the second integrated key.

REMOTE MEMORY DEACTIVATION

1. Press the set button on the driver door panel.
2. Within 5 seconds press any button on the integrated key that you wish to deactivate and then press the set button on the driver door panel.
3. If a second memory setting desired to be deactivated, repeat the procedure with the second integrated key.

AUTOLOCK AND HORN CHIRP PROGRAMMING

Programming the Autolock Feature Using the Door Lock Control Switch

NOTE: The horn chirp is not programmable, but is used to verify the programming mode is entered and if the feature has been enabled or disabled.

NOTE: The autolock and auto-unlock features can also be enabled or disabled with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

NOTE: The autolock feature is not available on vehicles equipped with a manual transaxle.

NOTE: The autolock feature can be enabled or disabled independently of the auto-unlock feature.

NOTE: Make sure that the vehicle's perimeter alarm is not armed, the key is in the OFF position and the doors are closed.

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds

between programming sessions.

1. Turn the ignition key from the OFF to the RUN position.
2. Press the unlock button on the door lock control 3 times.
3. Turn the ignition key from the RUN to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition key to the RUN position. The horn chirps one time to indicate that programming mode is entered.
6. To enable/disable the autolock feature, press the unlock button on the door lock control switch then the lock button. The horn chirps once if the auto locks are disabled or twice (one short chirp followed by a long chirp) if the auto locks are enabled.
7. Turn the ignition key to the OFF position. The horn chirps once to signal that the programming is complete.

Programming the Autolock Feature Using the Keyless Entry Keypad

NOTE: **The horn chirp is not programmable, but is used to verify the programming mode is entered and if the feature has been enabled or disabled.**

NOTE: **The autolock and auto-unlock features can also be enabled or disabled with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.**

NOTE: **The autolock feature is not available on vehicles equipped with a manual transaxle.**

NOTE: **The autolock feature can be enabled or disabled independently of the auto-unlock feature.**

NOTE: **Make sure that the vehicle's perimeter alarm is not armed, the key is in the OFF position and the doors are closed.**

NOTE: **The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.**

1. Turn the ignition key to the OFF position.
2. Close all of the doors.
3. Enter the factory set 5 digit entry code.
4. Press and hold the 3/4 button. While holding the 3/4 button, press the 7/8 button.
5. Release the 7/8 button.
6. Release the 3/4 button. The horn chirps once if the auto locks are disabled, or chirps once followed by a

honk if the auto locks are enabled.

Programming the Auto-Unlock Feature Using the Door Lock Control Switch

NOTE: The horn chirp is not programmable, but is used to verify the programming mode is entered and if the feature has been enabled or disabled.

NOTE: The autolock and auto-unlock features can also be enabled or disabled with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

NOTE: The auto-unlock feature is disabled on vehicles equipped with a manual transaxle.

NOTE: The auto-unlock feature can be enabled or disabled independently of the autolock feature.

NOTE: Make sure that the vehicles perimeter alarm is not armed, the key is in the OFF position and the doors are closed.

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition key from the OFF to the RUN position.
2. Press the unlock button on the door unlock control 3 times.
3. Turn the ignition key from the RUN to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition key to the RUN position. The horn chirps one time to indicate that programming mode is entered.
6. To enable/disable the auto-unlock feature, press the lock button on the door lock control switch then the unlock button. The horn chirps once if auto-unlock is disabled or twice (one short chirp followed by a long chirp) if auto-unlock is enabled.
7. Turn the ignition key to the OFF position. The horn chirps once to signal that the programming is complete.

Programming the Auto-Unlock Feature Using the Keyless Entry Keypad

NOTE: The horn chirp is not programmable, but is used to verify the programming mode is entered and if the feature has been enabled or disabled.

NOTE: The autolock and auto-unlock features can also be enabled or disabled with the scan tool. For additional information on module configuration, refer to MODULE

CONFIGURATION article.

NOTE: The auto-unlock feature is disabled on vehicles equipped with a manual transaxle.

NOTE: The auto-unlock feature can be enabled or disabled independently of the autolock feature.

NOTE: Make sure that the vehicle's perimeter alarm is not armed, the key is in the OFF position and the doors are closed.

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition key to the OFF position.
2. Close all of the doors.
3. Enter the factory set 5 digit entry code.
4. Press and hold the 3/4 button. While holding the 3/4 button, press and release the 7/8 button. While still holding the 3/4 button, press and release the 7/8 button a second time.
5. Release the 3/4 button. The horn chirps once if auto-unlock is disabled, or chirps once followed by a honk if auto-unlock is enabled.

STEPPED UNLOCK PROGRAMMING

1. With the ignition switch in the OFF position, press the LOCK and UNLOCK buttons on the Remote Keyless Entry (RKE) transmitter simultaneously for 4 seconds.
   - The turn signals flash twice to indicate the mode change.
2. Repeat Step 1 to enable/disable the stepped unlocking feature.

PERIMETER LIGHTING FEATURE PROGRAMMING

Programming the Perimeter Lighting Feature Using the Door Lock Control Switch

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition switch from the OFF to the ON position.
2. Press the unlock button on the door lock control switch 3 times.
3. Turn the ignition switch from the ON to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition switch to the ON position. The horn chirps one time to indicate that programming mode

is entered.

NOTE: The unlock button must be pressed twice within 5 seconds.

6. Within 30 seconds of entering the programming mode, press the unlock button on the door lock control switch twice to enable/disable the perimeter lighting feature. The horn chirps once if the perimeter lighting is disabled or a chirp followed by a honk if the perimeter lighting is enabled.
7. Programming ends when the ignition switch state changes or times out after 2 minutes.

REMOVAL AND INSTALLATION

HOOD LATCH AND COMPONENTS - EXPLODED VIEW

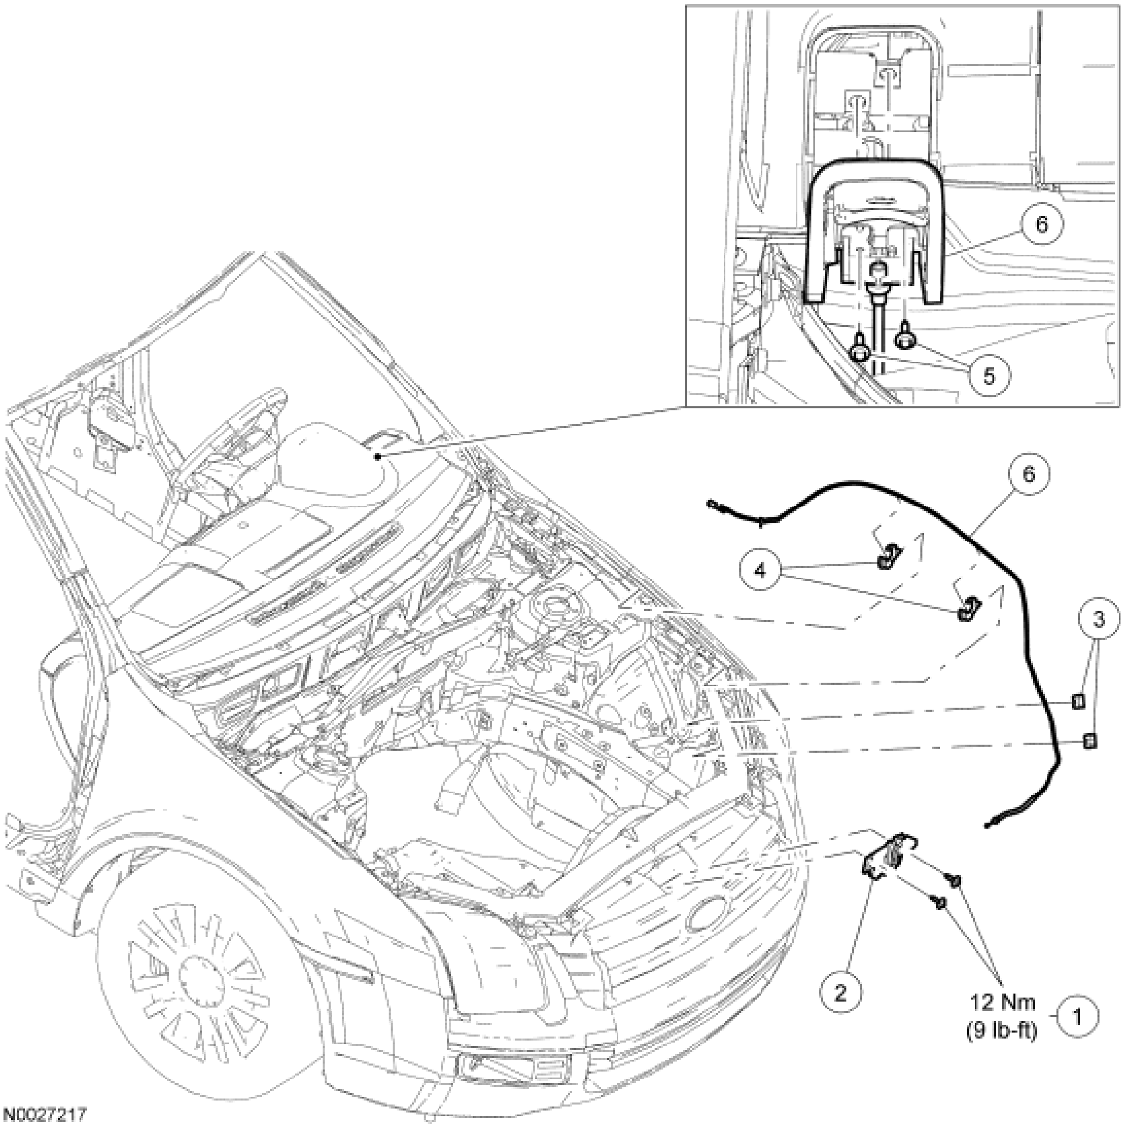

Fig. 37: Exploded View Of Hood Latch & Components With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N808727	Hood latch bolts (2 required)
2	16700	Hood latch
3	W70678	Hood latch release cable locators (2 required)
4	14A163	Hood latch release cable locators (2 required)
5	N807122	Hood latch release handle screws (2 required)
6	16916	Hood latch release handle and cable

1. For additional information, refer to the procedures.

HOOD LATCH

Material

Item	Specification
Multi-Purpose Grease Spray XL-5	ESB-M1C93-B

REMOVAL AND INSTALLATION

NOTE: Mark the hood latch position prior to removal of the hood latch bolts.

1. Remove the 2 hood latch bolts and position the hood latch aside.
   - To install, tighten to 12 Nm (9 lb-ft).
2. Disconnect the hood latch release cable and remove the hood latch.

NOTE: When the hood latch is installed, the latch adjustment must be checked to make sure the latch is installed and aligned correctly.

3. To install, reverse the removal procedure.
   - Lubricate the hood latch after installation.

HOOD LATCH RELEASE HANDLE

REMOVAL AND INSTALLATION

1. Remove the hood latch. For additional information, refer to **Hood Latch**.
2. Remove the LH fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
3. Release the 2 hood latch release cable locators from the radiator grille opening panel reinforcement.
4. Disconnect the hood latch release cable from the LH fender opening, open the 2 hood latch release cable locators and position the cable aside.

5. Release the hood latch release cable locator from the wiring harness.
6. Remove the 2 hood latch release handle screws.

NOTE: The hood latch release handle and cable assembly must be pulled through the dash panel into the passenger compartment.

7. Remove the hood latch release handle and cable assembly.
8. To install, reverse the removal procedure.

FRONT DOOR HANDLES, LOCKS AND LATCHES - EXPLODED VIEW

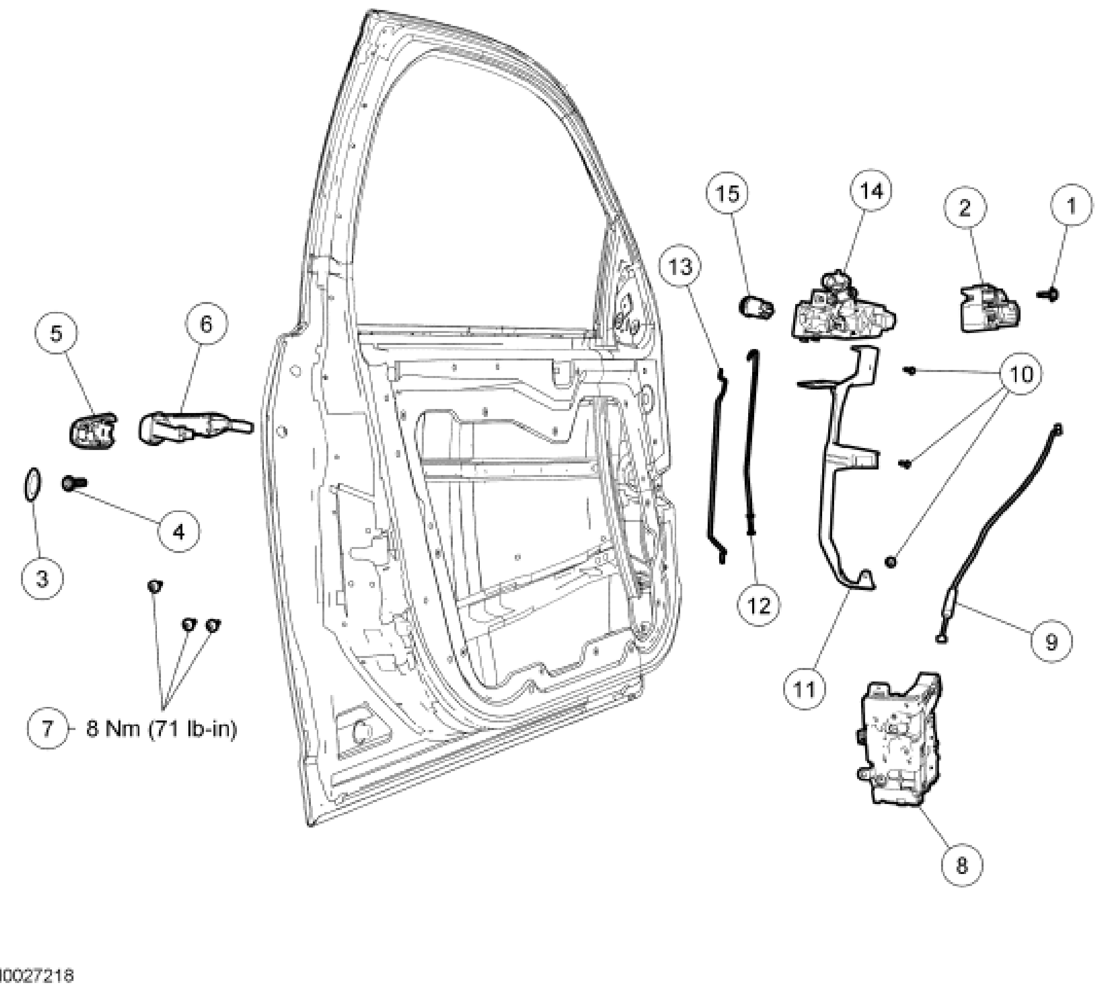

Fig. 38: Exploded View Of Front Door Handles, Locks & Latches With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Interior door handle screw
2	5422600/ 5422601	Interior door handle (RH/LH)
3	-	Grommet
4	-	Exterior front door handle cover screw
5	5422088/ 54218A14	Exterior front door handle cover (RH/LH)
6	5422404	Exterior front door handle
7	W705830-S900	Front door latch bolts (3 required)
8	5421812/ 5421813	Front door latch RH/LH)
9	-	Interior door handle actuating cable
10	-	Anti-theft guard screw (3 required) (part of 5421812/5421813)
11	-	Anti-theft guard (part of 542181254/21813)
12	5422152/ 5422153	Exterior door handle actuating rod (RH/LH)
13	5422135	Front door lock cylinder actuating rod (if equipped)
14	5426684/ 5426685	Exterior front door handle reinforcement (RH/LH)
15	-	Front door lock cylinder

1. For additional information, refer to the procedures.

INTERIOR DOOR HANDLE - FRONT

REMOVAL AND INSTALLATION

1. Remove the front door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the interior front door handle screw.
3. Disconnect the front door interior door handle actuating cable and remove the interior door handle.
4. To install, reverse the removal procedure.

EXTERIOR FRONT DOOR HANDLE

REMOVAL AND INSTALLATION

1. Remove the grommet from the rear of the front door.
2. Remove the screw and the exterior front door handle cover.

NOTE: Pull the exterior front door handle outward and to the rear to release it from the front door handle reinforcement.

3. Remove the exterior front door handle.

4. If required, remove the 2 exterior front door handle seals.

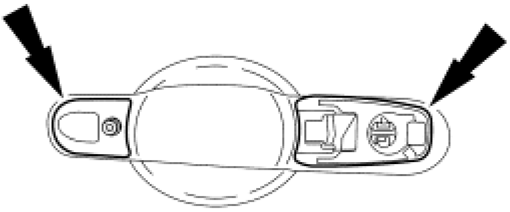

Fig. 39: Locating Exterior Front Door Handle
Courtesy of FORD MOTOR CO.

5. To install, reverse the removal procedure.

FRONT DOOR LATCH

Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

REMOVAL AND INSTALLATION

1. Remove the exterior front door handle. For additional information, refer to **Exterior Front Door Handle**.
2. Remove the front door window regulator and motor. For additional information, refer to **GLASS, FRAMES AND MECHANISMS** article.
3. Remove the 3 front door latch bolts.
   - To install, tighten to 8 Nm (71 lb-in)
4. Loosen the exterior front door handle reinforcement screw until the exterior door handle reinforcement slides free.
5. Remove the front door latch.
   - Slide the front door latch and exterior door handle reinforcement towards the front of the vehicle.
6. If required, remove the 3 screws and the anti-theft guard.
7. If required, disconnect the exterior front door handle actuating rod and the front door lock cylinder actuating rod.
8. If required, disconnect the interior front door handle actuating cable from the front door latch
9. To install, reverse the removal procedure.
   - Lubricate the front door latch to striker surfaces after installation.

DOOR LOCK CYLINDER - FRONT

REMOVAL AND INSTALLATION

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Remove the front door latch. For additional information, refer to **Front Door Latch**.
2. Using a suitable tool press the release button and remove the front door lock cylinder.

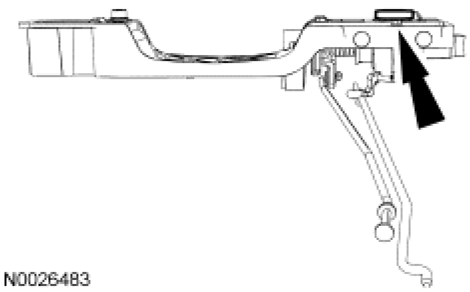

Fig. 40: Locating Front Door Lock Cylinder Release Button
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

REAR DOOR HANDLES, LOCKS AND LATCHES - EXPLODED VIEW

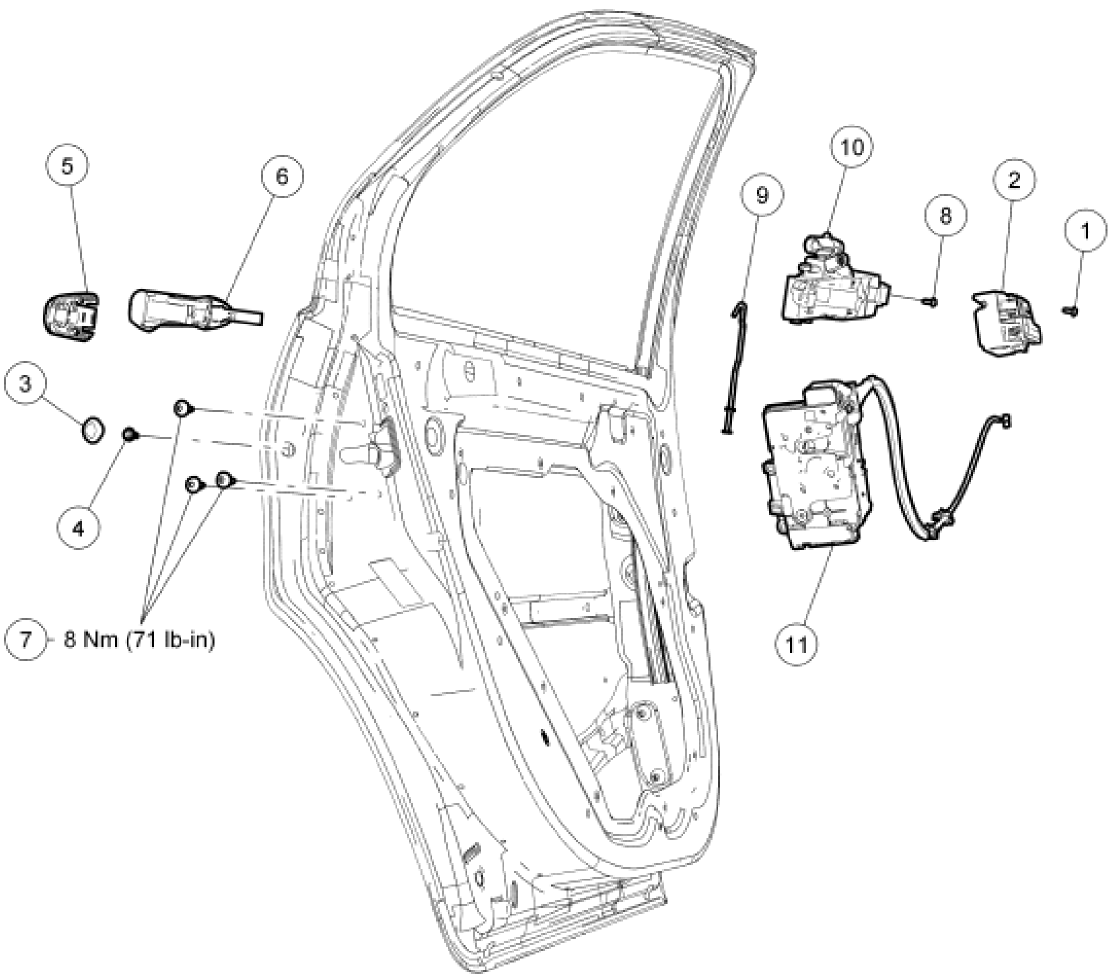

Fig. 41: Exploded View Of Rear Door Handles, Locks & Latches With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Interior rear door handle screw
2	5422600/ 5422601	Interior rear door handle (RH/LH)
3	-	Grommet
4	-	Exterior rear door handle cover screw
5	5422088	Exterior rear door handle cover
6	5422404	Exterior rear door handle
7	W705830-S900	Rear door latch bolts (3 required)
8	-	Rear door latch bracket screws (3 required) (part of 5426412/ 5426413)
9	5426596/ 5426597	Exterior door handle actuating rod

		(RH/LH)
10	5426684/ 5426685	Exterior rear door handle reinforcement (RH/LH
11	5426412/ 5426413	Rear door latch (RH/LH)

1. For additional information, refer to the procedures.

INTERIOR DOOR HANDLE - REAR

REMOVAL AND INSTALLATION

1. Remove the rear door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the interior rear door handle screw.
3. Disconnect the rear door interior door handle actuating cable and remove the interior door handle.
4. To install, reverse the removal procedure.

EXTERIOR REAR DOOR HANDLE

REMOVAL AND INSTALLATION

1. Remove the grommet from the rear of the rear door.
2. Remove the screw and the exterior rear door handle cover.

NOTE: Pull the exterior rear door handle outward and to the rear to release it from the rear door handle reinforcement.

3. Remove the exterior rear door handle.
4. If required, remove the 2 exterior rear door handle seals.

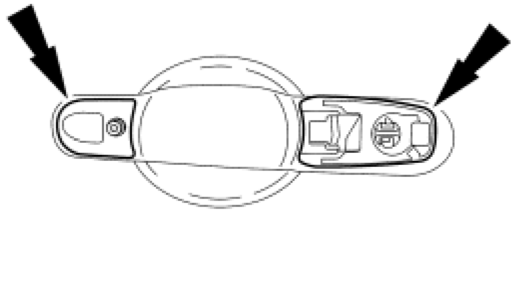

Fig. 42: Locating Exterior Front Door Handle
Courtesy of FORD MOTOR CO.

5. To install, reverse the removal procedure.

REAR DOOR LATCH

Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

REMOVAL AND INSTALLATION

1. Remove the exterior rear door handle. For additional information, refer to **Interior Door Handle - Rear**.
2. Remove the rear door window regulator and motor. For additional information, refer to **GLASS, FRAMES AND MECHANISMS** article.
3. Remove the rear door window glass. For additional information, refer to **GLASS, FRAMES AND MECHANISMS** article.
4. Remove the 3 rear door latch bolts.
    - To install, tighten to 8 Nm (71 lb-in).
5. Loosen the exterior rear door handle reinforcement screw until the exterior rear door handle reinforcement slides free.
6. Remove the rear door latch.
    - Slide the rear door latch and exterior rear door handle reinforcement towards the front of the vehicle.
7. If required, remove the 3 screws and the rear door latch bracket.
8. If required, disconnect the exterior rear door handle actuating rod.
9. To install, reverse the removal procedure.
    - Lubricate the rear door latch to striker surfaces after installation.

LUGGAGE COMPARTMENT LID LATCH

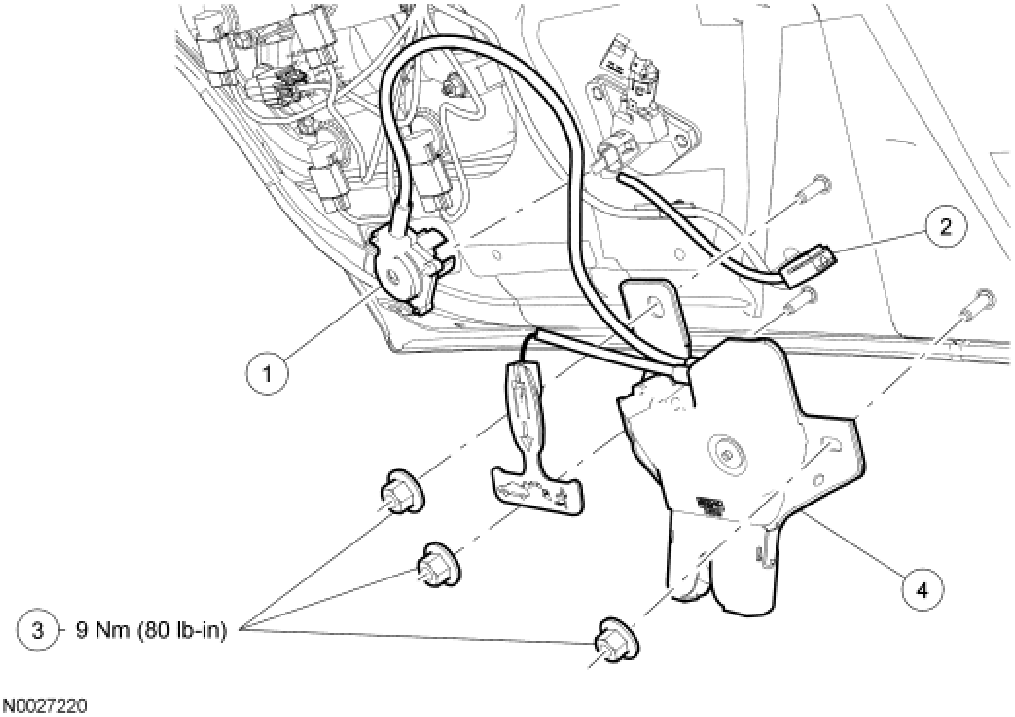

Fig. 43: Exploded View Of Luggage Compartment Lid Latch With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Luggage compartment lid lock cylinder actuating cable (part of 5443200)
2	-	Luggage compartment lid latch electrical connector (part of 14A005)
3	W705760	Luggage compartment lid latch nuts (3 required)
4	5443200	Luggage compartment lid latch

REMOVAL AND INSTALLATION

1. Remove the 12 pin-type retainers and the luggage compartment lid trim panel.
2. Disconnect the luggage compartment lid lock cylinder actuating cable from the luggage compartment lid lock cylinder.
3. Disconnect the electrical connector from the luggage compartment lid latch.
4. Remove the 3 nuts and the luggage compartment lid latch.
    - To install, tighten to 9 Nm (80 lb-in).
5. To install, reverse the removal procedure.

IGNITION LOCK CYLINDER

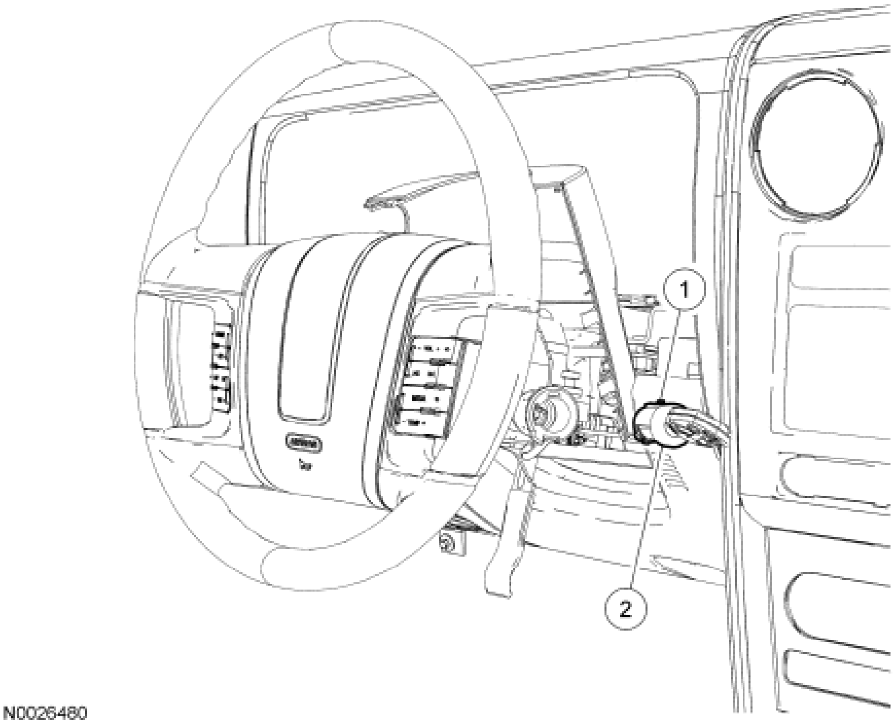

Fig. 44: Exploded View Of Ignition Lock Cylinder
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ignition lock cylinder release button (part of 11582)
2	11582	Ignition lock cylinder

REMOVAL AND INSTALLATION

1. Remove the Passive Anti-Theft System (PATS) transceiver. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
2. Turn the ignition key to the ON position.
3. Using a suitable tool, press the ignition lock cylinder release button and remove the ignition lock cylinder.
4. To install, reverse the removal procedure.

LUGGAGE COMPARTMENT LID LOCK CYLINDER

Special Tools

Illustration	Tool Name	Tool Number
	Heavy Duty Riveter	501-D011 (D80L-23200-A) or equivalent

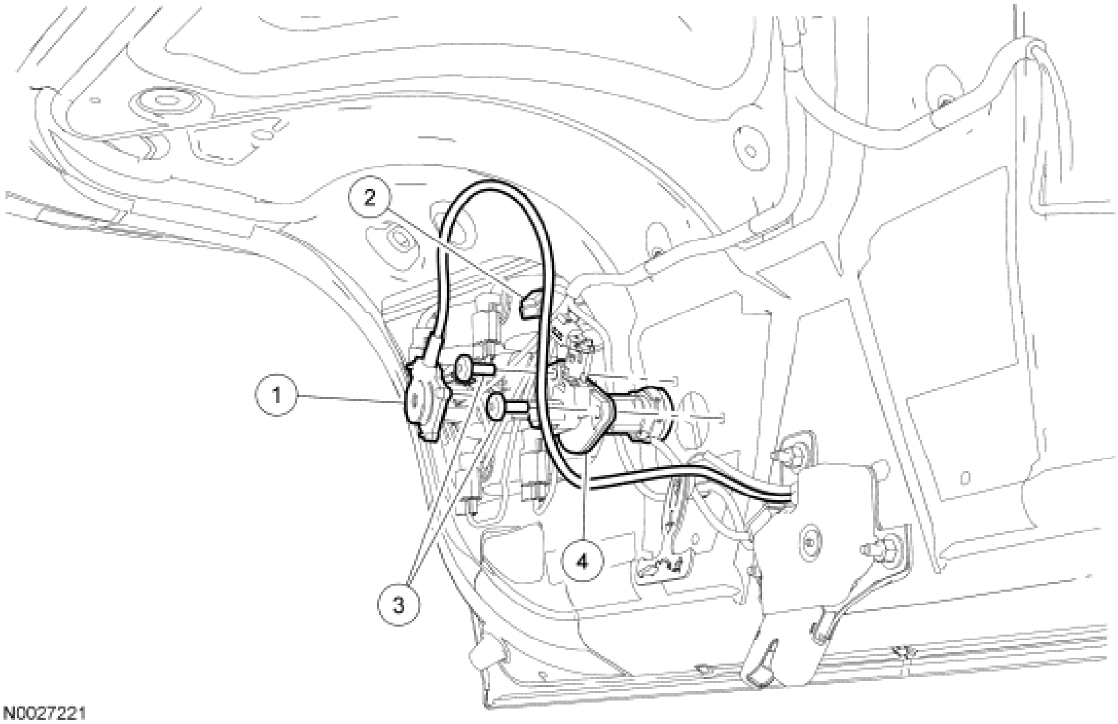

Fig. 45: Exploded View Of Luggage Compartment Lid Lock Cylinder
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Luggage compartment lid lock cylinder actuating cable (part of 5443200)
2	-	Luggage compartment lid lock cylinder electrical connector (part of 14A005) (if equipped)
3	-	Luggage compartment lid lock cylinder rivets (2 required)
4	544362	Luggage compartment lid lock cylinder

REMOVAL AND INSTALLATION

1. Remove the 12 pin-type retainers and the luggage compartment lid trim panel.
2. Disconnect the luggage compartment lid lock cylinder actuating cable from the luggage compartment lid lock cylinder.
3. If equipped, disconnect the electrical connector from the luggage compartment anti-theft inhibit switch.
4. Remove the 2 rivets and the luggage compartment lid lock cylinder.
   - Use the special tool to install new rivets.
5. To install, reverse the removal procedure.

DOOR LOCK CONTROL SWITCH

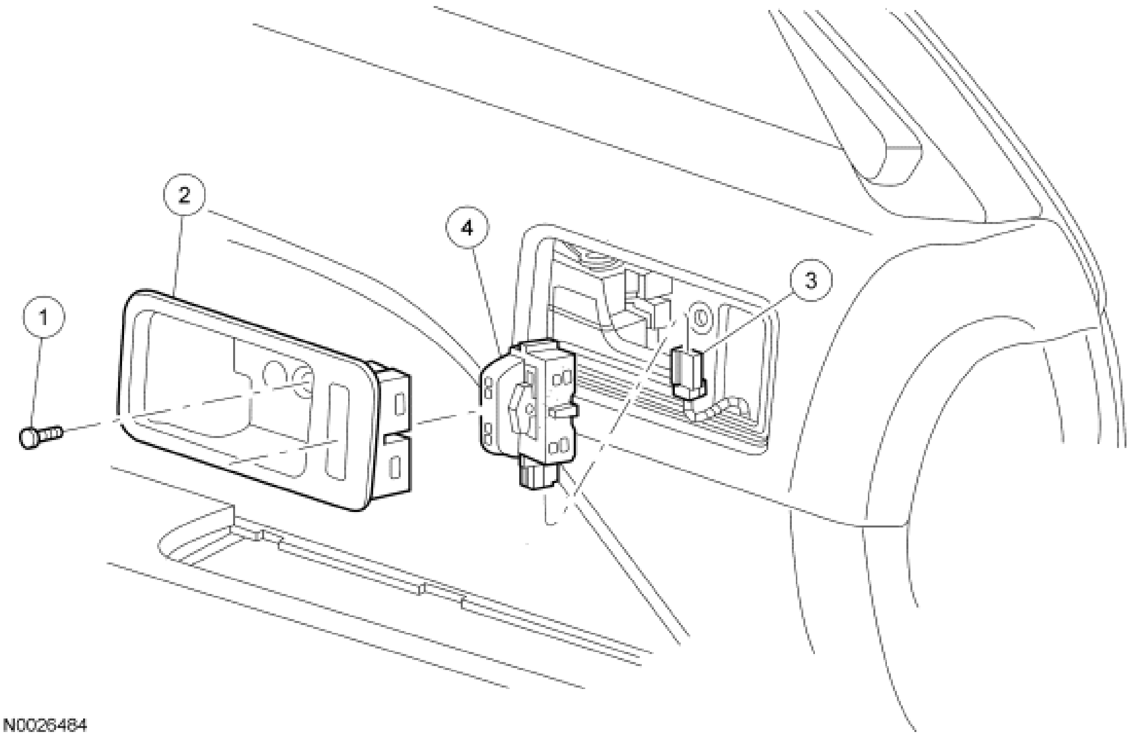

Fig. 46: Exploded View Of Door Lock Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Interior front door handle finish panel screw
2	5422620/ 5422621	Interior front door handle finish panel (RH/LH)
3	-	Door lock control switch electrical connector (part of 14630/14631)
4	14028	Door lock control switch

REMOVAL AND INSTALLATION

1. Open the cover, remove the screw and position the interior front door handle finish panel aside.
2. Disconnect the door lock control switch electrical connector.
3. Release the locking clips and remove the door lock control switch.
4. To install, reverse the removal procedure.

KEYLESS ENTRY KEYPAD

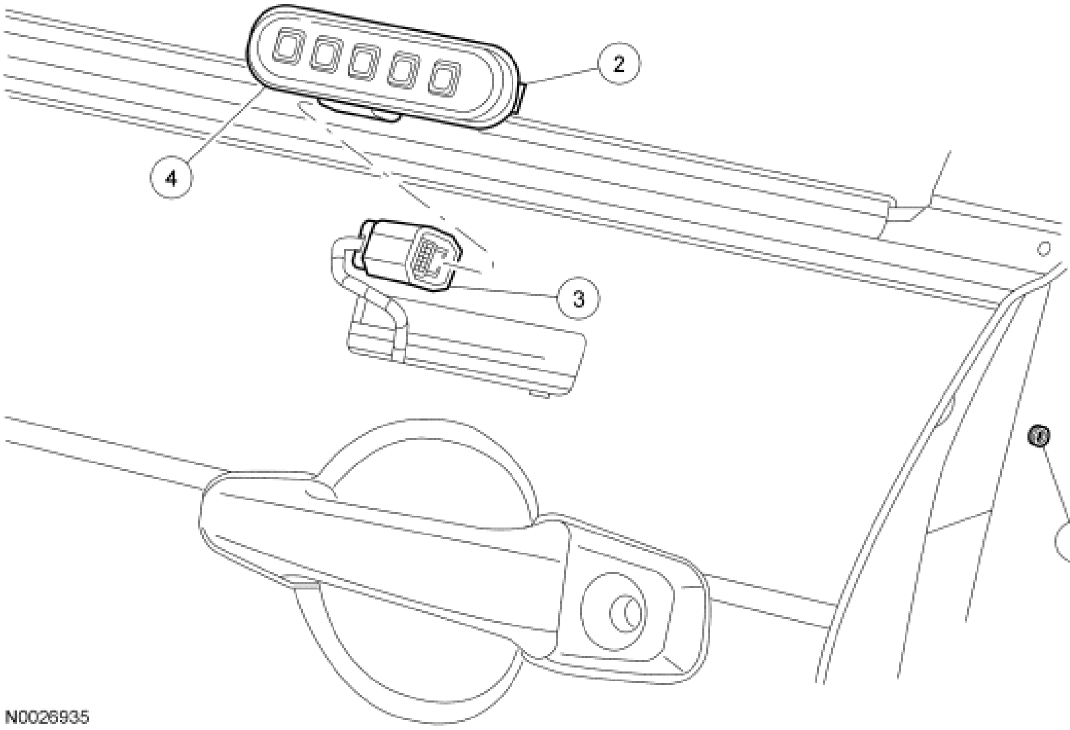

Fig. 47: Exploded View Of Keyless Entry Keypad
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Grommet
2	-	Keyless entry keypad retaining clip (2 required) (part of 14A626)
3	-	Keyless entry keypad electrical connector (part of 14631)
4	14A626	Keyless entry keypad

REMOVAL AND INSTALLATION

1. Remove the grommet.
2. Using a suitable tool, release the rear keyless entry keypad retaining clip and position the keyless entry keypad aside.
3. Remove the keyless entry keypad.
   - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

Horn - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Horn bolt	10	89

DESCRIPTION AND OPERATION

HORN

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The horn system consists of the following components:

- Horn switches (part of the steering wheel)
- Clockspring
- Horn relay (part of the SJB)
- Horn (located forward of the RF wheelwell)

The horn can be operated by pressing the switch on the steering wheel. It is also controlled by the SJB when it is utilized for the panic function, or during a perimeter anti-theft alarm event.

DIAGNOSTIC TESTS

HORN

Special Tools

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R0057 or equivalent
	Flex Probe Kit	105-R025C or equivalent

 ST2574-A		

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The battery junction box (BJB) supplies the control and switched voltage to the horn relay (part of the SJB). When the horn switches are pressed, ground is supplied through the clockspring to the horn relay. The horn relay is then energized, directing voltage to the horn. When the perimeter anti-theft system is armed, the SJB provides a momentary ground to the horn relay control side to indicate the system is armed, and an on and off ground when an intrusion is detected or the panic feature is activated.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Horn • Horn switches (part of the steering wheel)	• Battery junction box (BJB) fuse 2 (60A) • Smart junction box (SJB) fuse 2 (20A) • Wiring, terminals or connectors • Clockspring • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom. Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
	• Fuse • Wiring, terminals or	

• The horn is inoperative	connectors • Horn • Clockspring • Horn switches (part of the steering wheel) • Smart junction box (SJB)	• Go to **Pinpoint Test A**.
• The horn is always on	• Wiring, terminals or connectors • Clockspring • Horn switches (part of the steering wheel) • SJB	• Go to **Pinpoint Test B**.

Pinpoint Tests

Pinpoint Test A: The Horn Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Horn/Cigar Lighter for schematic and connector information.

Normal Operation

The battery junction box (BJB) supplies the switched and control voltage to the horn relay (part of the smart junction box [SJB]) through circuit SBB02 (YE/RD). When the horn switches (part of the steering wheel) are pressed, the horn relay is grounded through the horn switch circuitry, energizing the horn relay. The horn relay then sends voltage to the horn through circuit CBP05 (YE), sounding the horn. Ground for the horn is supplied through circuit GD123 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Horn
- Clockspring
- Horn switches (part of the steering wheel)
- SJB

PINPOINT TEST A: THE HORN IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK THE HORN OPERATION USING THE PANIC BUTTON

- Press the PANIC button on the integrated key head transmitter (IKT).
- **Does the horn sound when the PANIC button is pressed?**

  YES : Go to A2.

  NO : Go to A7.

A2 CHECK CIRCUIT GD165 (BK) FOR AN OPEN

- Key in OFF position.
- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Clockspring C218b

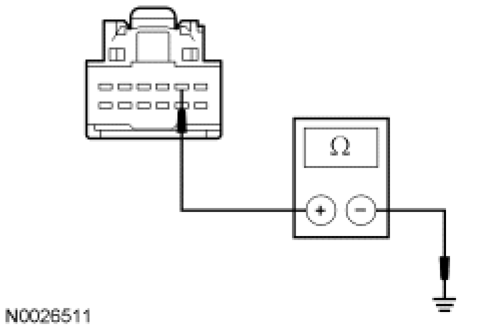

Fig. 1: Checking Circuit GD165 (BK) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218b-2, circuit GD165 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A3.

  NO : REPAIR the circuit. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

A3 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Disconnect: Clockspring C218a

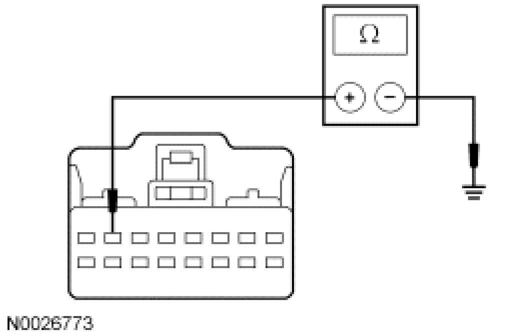

Fig. 2: Checking Circuit GD116 (BK/VT) For Open
Courtesy of FORD MOTOR CO.

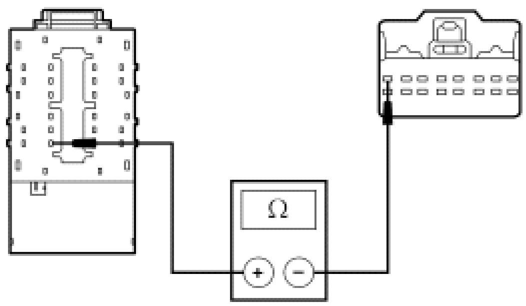
- Measure the resistance between the clockspring C218a-7, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A4.

  NO : REPAIR the circuit. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

A4 CHECK CIRCUIT CRH02 (BU/WH) FOR AN OPEN

- Disconnect: SJB C2280b



N0026512

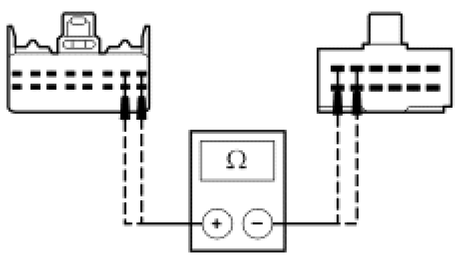
Fig. 3: Checking Circuit CRH02 (BU/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280b-6, circuit CRH02 (BU/WH), harness side and the clockspring C218a-8, circuit CRH02 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A5.

  NO : REPAIR the circuit. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

A5 CHECK THE CLOCKSPRING FOR AN OPEN



N0026513

Fig. 4: Checking Clockspring For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218a pin 7, component side and the clockspring C218b pin 2, component side; and between the clockspring C218a pin 8, component side and the clockspring C218b pin 1, component side.

- **Are the resistances less than 5 ohms?**

  YES : Go to A6.

  NO : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

A6 CHECK THE STEERING WHEEL SWITCH HARNESS FOR AN OPEN

- Disconnect: Horn Switch C2296 and C2297

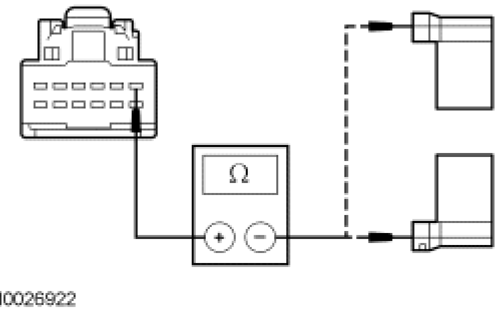


Fig. 5: Checking Steering Wheel Switch Harness For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218b-1, circuit CRH02 (BU/WH), harness side and the horn switch C2296-1, circuit CRH02 (BU/WH), harness side; and between the clockspring C218b-1, circuit CRH02 (BU/WH), harness side and the horn switch C2297-1, circuit CRH02 (BU/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new steering wheel. REFER to **STEERING COLUMN** article. TEST the system for normal operation.

  NO : REPAIR the circuit in question. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

A7 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Horn C131

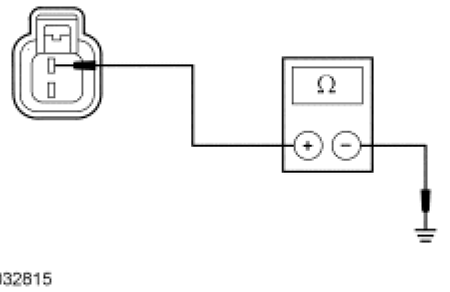

Fig. 6: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the horn C131-1, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 0.1 ohm?**

  YES : Go to A8.

  NO : REPAIR the circuit. TEST the system for normal operation.

A8 CHECK CIRCUIT CBP05 (YE) FOR VOLTAGE

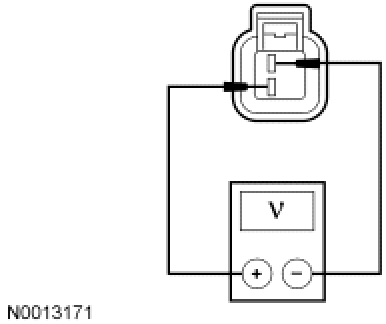

Fig. 7: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the horn C131-2, circuit CBP05 (YE), harness side, and the horn C131-1, circuit GD123 (BK/GY), harness side, while pressing the horn switch.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new horn. REFER to **Horn**. TEST the system for normal operation.

  NO : VERIFY the SJB fuse 2 (20A) is OK. If OK, go to A9. If not OK, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

A9 CHECK CIRCUIT CBP05 (YE) FOR AN OPEN

- Disconnect: SJB C2280a

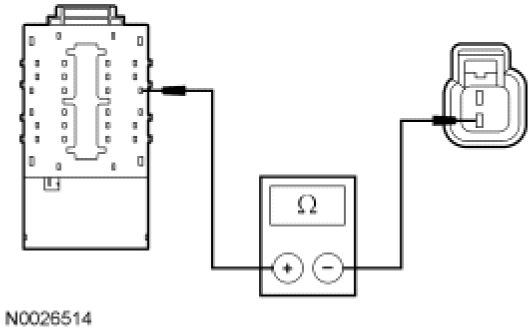

Fig. 8: Checking Circuit CBP05 (YE) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280a-20, circuit CBP05 (YE), harness side, and the horn C131-2, circuit CBP05 (YE), harness side.
- **Is the resistance less than 0.1 ohm?**

YES : Go to A10.

NO : REPAIR the circuit. TEST the system for normal operation.

A10 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Horn Is Always On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Horn/Cigar Lighter for schematic and connector information.

Normal Operation

The battery junction box (BJB) supplies the switched and control voltage to the horn relay (part of the smart junction box [SJB]) through circuit SBB02 (YE/RD). When the horn switches (part of the steering wheel) are pressed, the horn relay is grounded through the horn switch circuitry, energizing the horn relay. The horn relay then sends voltage to the horn through circuit CBP05 (YE), sounding the horn. Ground for the horn is supplied through circuit GD123 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Horn switches (part of the steering wheel)
- SJB

PINPOINT TEST B: THE HORN IS ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK CIRCUIT CBP05 (YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280a
- **Does the horn continue to sound?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to B2.

B2 CHECK THE HORN SWITCH INPUT

- Connect: SJB C2280a
- Disconnect: SJB C2280b
- **Does the horn continue to sound?**

  YES : Go to B6.

  NO : Go to B3.

B3 CHECK CIRCUIT CRH02 (BU/WH) FOR A SHORT TO GROUND

- Depower the supplemental restraint system (SRS). Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Clockspring C218a

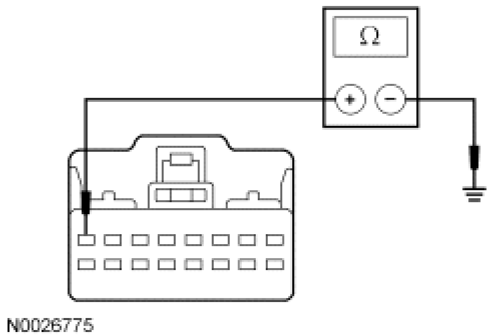

Fig. 9: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218a-8, circuit CRH02 (BU/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

B4 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Connect: Clockspring C218a
- Disconnect: Clockspring C218b

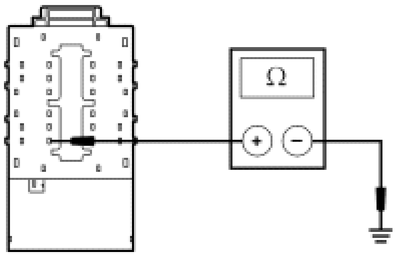

Fig. 10: Checking Clockspring For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280b-6, circuit CRH02 (BU/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B5.

  NO : INSTALL a new clockspring. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

B5 CHECK THE STEERING WHEEL SWITCH HARNESS FOR A SHORT TO GROUND

- Disconnect: Horn Switch C2296 and C2297

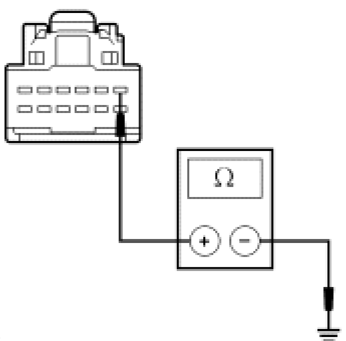

Fig. 11: Checking Steering Wheel Switch Harness For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring 218b-1, circuit CRH02 (BU/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new steering wheel. REFER to **STEERING COLUMN** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : REPAIR the circuit. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

B6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.

- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

REMOVAL AND INSTALLATION

HORN

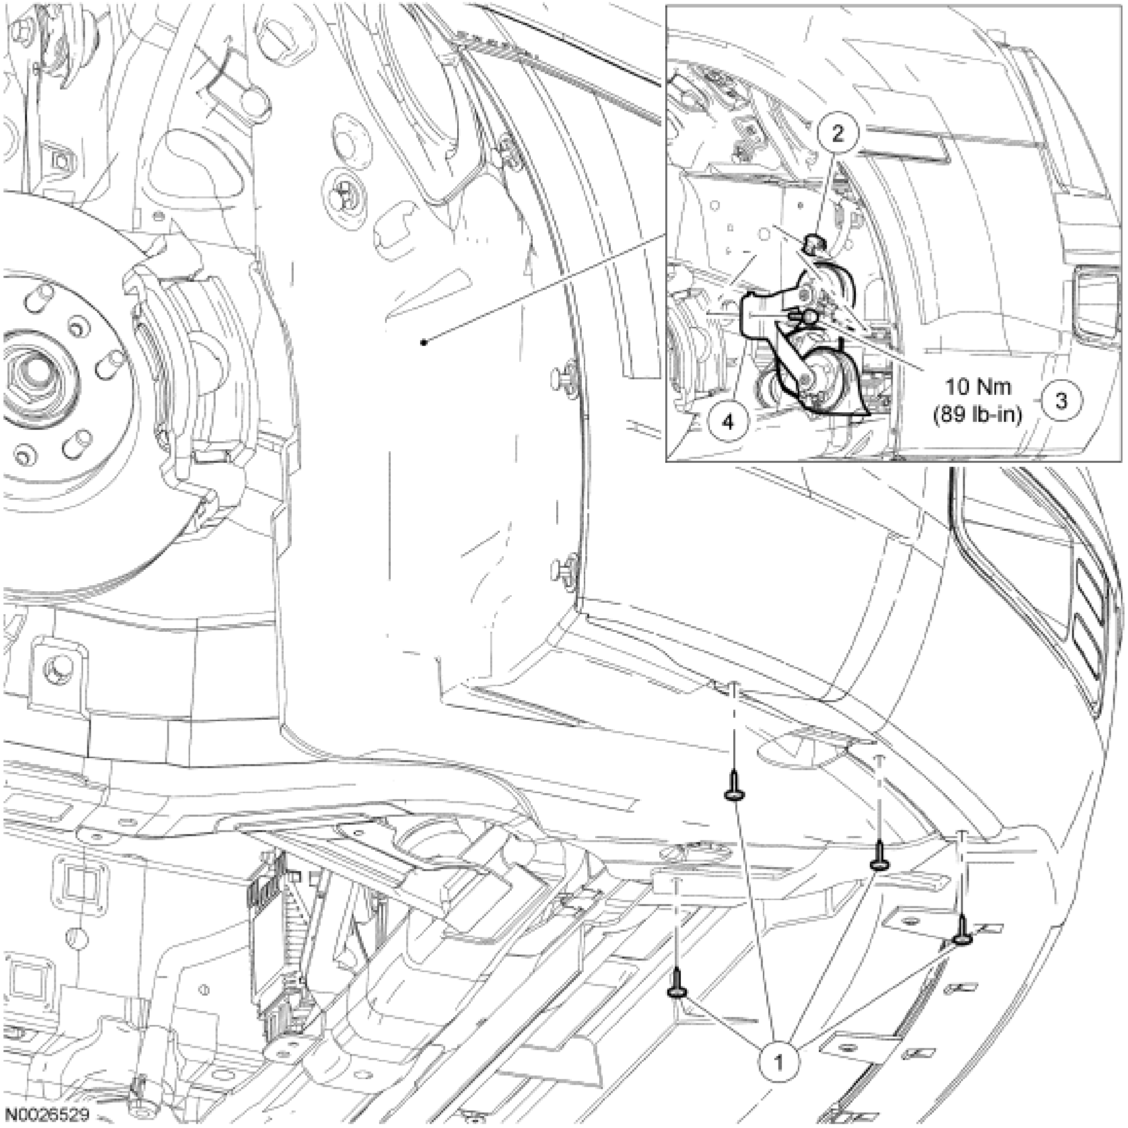

Fig. 12: Exploded View Of Horn Components With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706805	RH front fender splash shield screws (4 required)
2	-	Horn electrical connector (part of 14290)
3	W605784	Horn bolt
4	13832	Horn

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the 4 RH front fender splash shield screws.

- Pull the RH front fender splash shield downward to access the horn.

3. Disconnect the electrical connector.
4. Remove the bolt and the horn.
   - To install, tighten to 10 Nm (89 lb-in).
5. To install, reverse the removal procedure.

High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	227.5 ml (0.48 pt)

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Brake fluid remote reservoir nuts	7	-	62
Brake fluid reservoir pin bolt	6	-	53
Brake master cylinder nuts	25	18	-
Brake pedal bracket bolts	23	17	-
Brake pedal bracket nuts	23	17	-
Brake pressure control valve bolts	11	-	97
Brake tube fittings	17	-	150

DESCRIPTION AND OPERATION

HYDRAULIC BRAKE ACTUATION

The hydraulic brake actuation system consists of the following components:

- ABS components
- Brake master cylinder
- Brake pedal (fixed or adjustable)
- Brake tubes and hoses
- Front disc brake calipers
- Rear disc brake calipers

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed through the double-walled steel tube and flexible hoses to the front and rear disc brake calipers. The brake fluid enters the disc brake calipers, forcing the caliper pistons and brake pads outward against the brake disc friction surface, slowing or stopping rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear disc brake caliper pistons

and brake pads to the unapplied position.

DIAGNOSTIC TESTS

HYDRAULIC BRAKE ACTUATION

Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

BRAKE PEDAL AND BRACKET

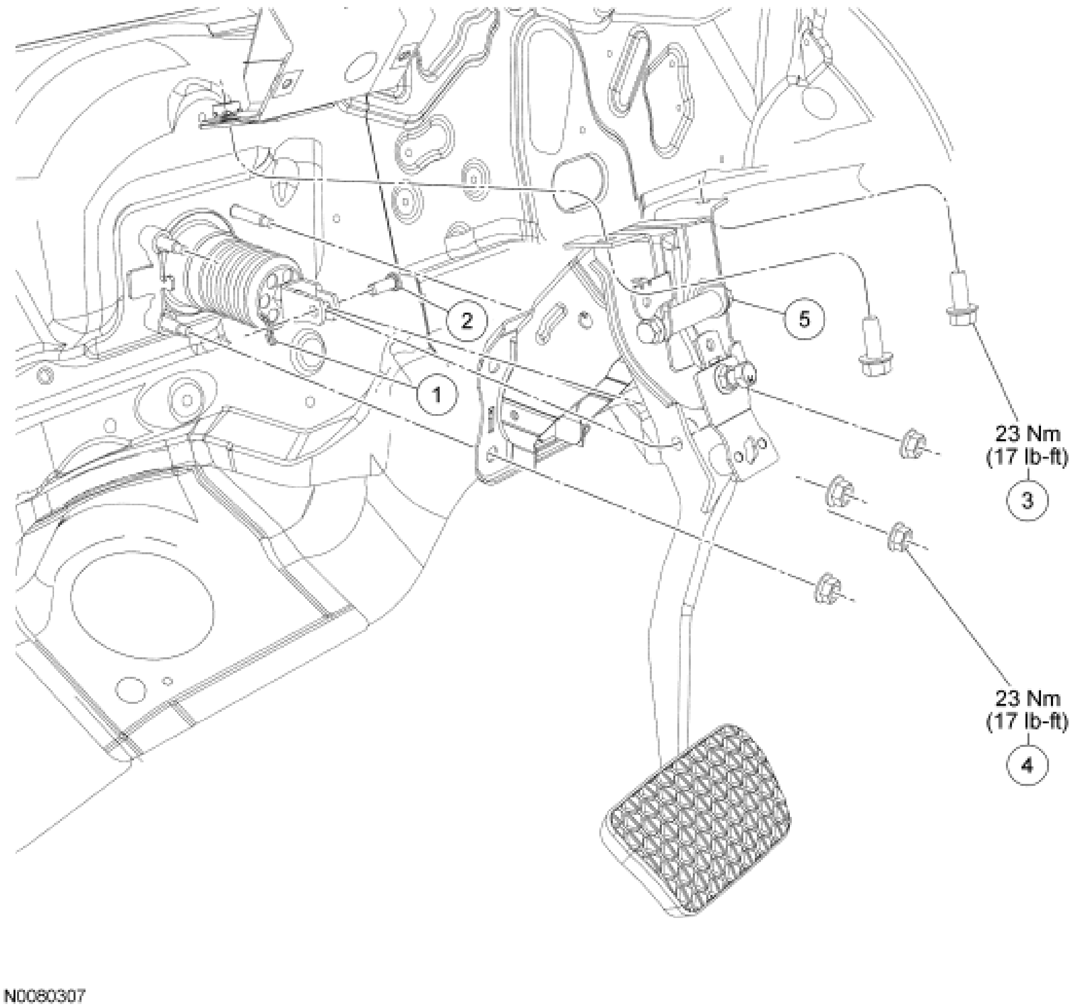

Fig. 1: Exploded View Of Brake Pedal & Bracket With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7B096	Brake booster push rod pin clip
2	2N513	Brake booster push rod pin
3	W707142	Brake pedal bracket bolt (2 required)
4	W520212	Brake pedal bracket nut (4 required)
5	2455	Brake pedal and bracket

REMOVAL AND INSTALLATION

CAUTION: Do not service the brake pedal or brake booster without first removing the stoplamp switch and speed control deactivator switch. These switches must be removed with the brake pedal in the at-rest position. Switch plungers must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.

1. Remove the stoplamp switch. For additional information, refer to **EXTERIOR LIGHTING** article.
2. Remove the brake booster push rod pin clip.
3. Remove the brake booster push rod pin.
4. Remove the 2 brake pedal bracket bolts.
   - To install, tighten to 23 Nm (17 lb-ft).
5. Remove the 4 brake pedal bracket nuts and the brake pedal and bracket assembly.
   - To install, tighten to 23 Nm (17 lb-ft).

CAUTION: Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch or the speed control deactivator switch. These switches must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position will result in incorrect adjustment and may damage the switches.

6. To install, reverse the removal procedure.

BRAKE MASTER CYLINDER - 2.3L AND 3.0L

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Automatic transmission shown, manual transmission similar.

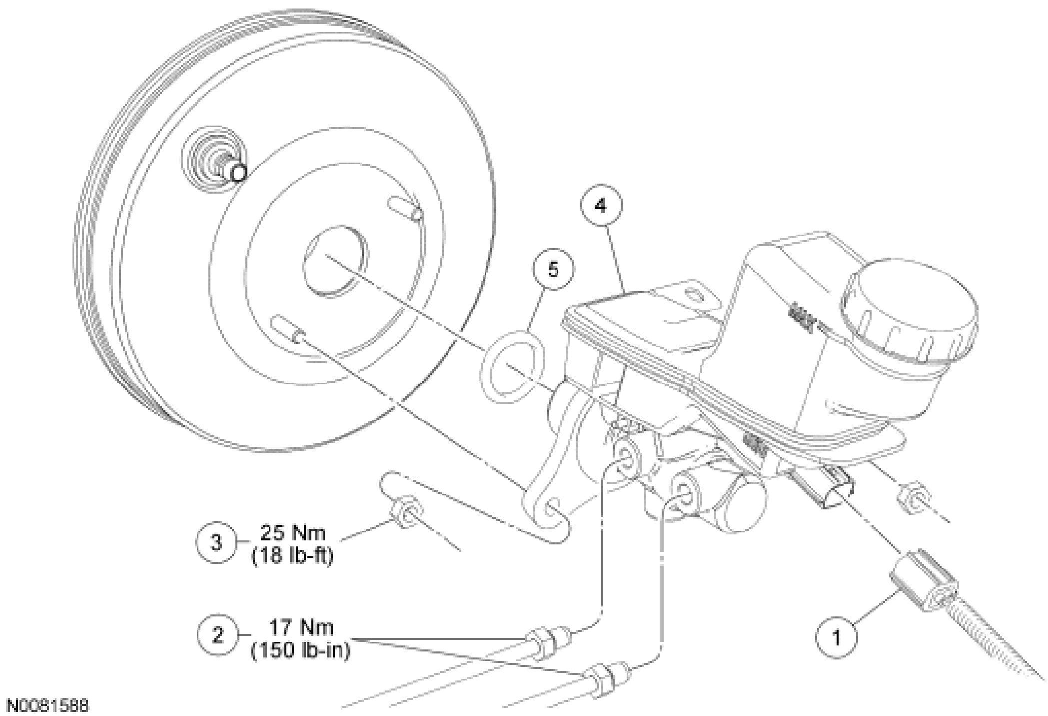

Fig. 2: Exploded View Of Brake Master Cylinder With Torque Specifications - 2.3L & 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Brake fluid level warning switch electrical connector (part of 14290)
2	-	Brake tube fittings (part of 2C360)
3	2152	Brake master cylinder nut kit
4	2140	Brake master cylinder assembly
5	-	Brake master cylinder-to-brake booster seal (part of 2152)

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the brake fluid level warning switch electrical connector.
2. Using a suitable suction device, remove the brake fluid from the brake master cylinder reservoir.
3. If equipped with a manual transmission, disconnect the clutch master cylinder feed hose.
   - Plug the clutch master cylinder feed hose.
4. Disconnect the brake tube fittings, plug the brake tubes and the brake master cylinder ports.
   - To install, tighten to 17 Nm (150 lb-in).
5. Remove the 2 brake master cylinder nuts.
   - To install, tighten to 25 Nm (18 lb-ft).
6. Remove the brake master cylinder.
7. To install, reverse the removal procedure.
   - Bleed the master cylinder. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.
   - If equipped with a manual transmission, bleed the clutch master cylinder. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.

BRAKE MASTER CYLINDER - 3.5L

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Automatic transmission shown, manual transmission similar.

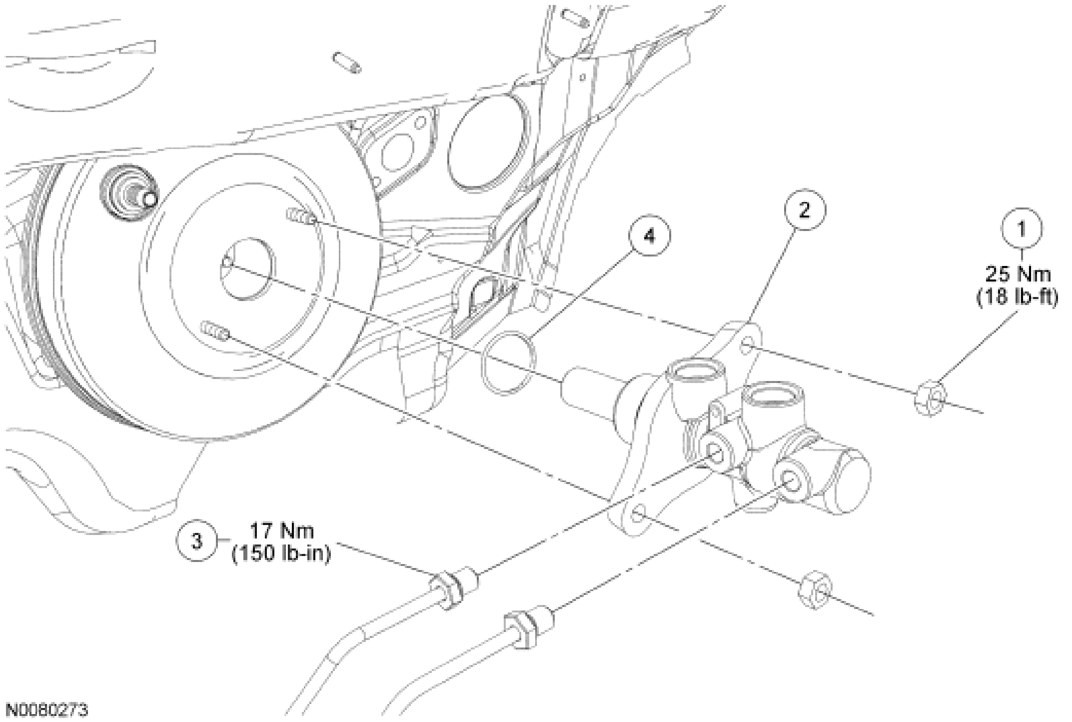

Fig. 3: Exploded View Of Brake Master Cylinder With Torque Specifications - 3.5L

2	2140	Brake master cylinder assembly
3	-	Brake tube fitting (part of 2C360)
4	-	Brake master cylinder-to-brake booster seal (part of 2152)

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is

spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the brake fluid reservoir. For additional information, refer to **Brake Fluid Reservoir - 3.5L**.
2. If equipped with a manual transmission, disconnect the clutch master cylinder feed hose.
   - Plug the clutch master cylinder feed hose.
3. Disconnect the brake tube fittings, plug the brake tubes and the brake master cylinder ports.
   - To install, tighten to 17 Nm (150 lb-in).
4. Remove the 2 brake master cylinder nuts.
   - To install, tighten to 25 Nm (18 lb-ft).
5. Remove the brake master cylinder.
6. To install, reverse the removal procedure.
   - Bleed the master cylinder. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.
   - If equipped with a manual transmission, bleed the clutch master cylinder. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.

BRAKE FLUID RESERVOIR - 2.3L AND 3.0L

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Automatic transmission shown, manual transmission similar.

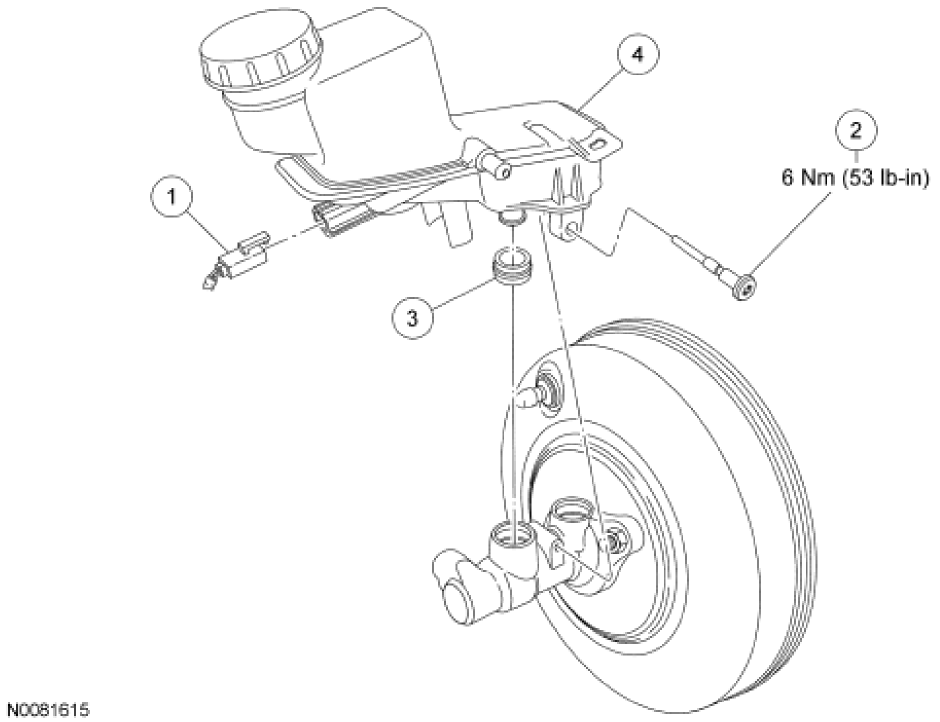

Fig. 4: Exploded View Of Brake Fluid Reservoir With Torque Specification - 2.3L and 3.0L

Item	Part Number	Description
1	-	Brake fluid level warning switch electrical connector (part of 14290)
2	2B176	Brake fluid reservoir pin bolt
3	2L074	Brake fluid reservoir seal (2 required)
4	2C246	Brake fluid reservoir

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is

spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the brake master cylinder. For additional information, refer to **Brake Master Cylinder - 2.3L and 3.0L**.
2. Remove the reservoir pin bolt and the brake fluid reservoir.
    - To install, tighten to 6 Nm (53 lb-in).
3. Remove and discard the 2 seals.

NOTE: Install new seals. Lubricate the seals with clean specified brake fluid.

4. To install, reverse the removal procedure.

BRAKE FLUID RESERVOIR - 3.5L

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Automatic transmission shown, manual transmission similar.

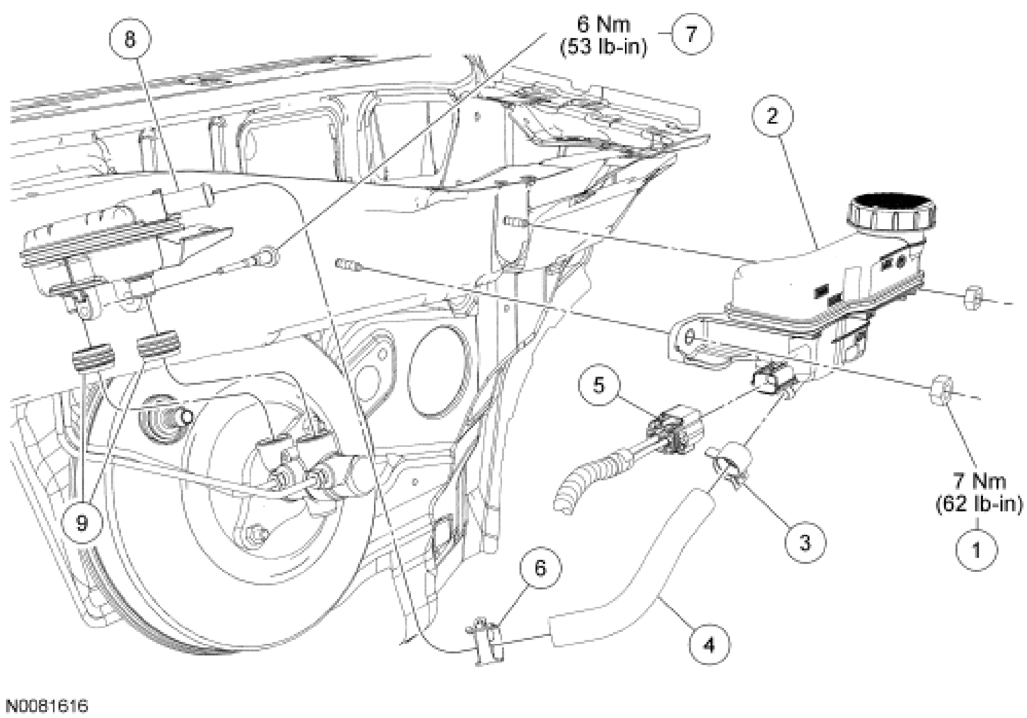

Fig. 5: Exploded View Of Brake Fluid Reservoir With Torque Specifications - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W520111	Brake fluid remote reservoir nut (2 required)
2	2K478	Brake fluid remote reservoir
3	-	Spring clamp (part of 2K478)
4	-	Brake fluid reservoir hose (part of 2K478)
5	-	Brake fluid level warning switch electrical connector (part of 14290)
6	-	Spring clamp (part of 2K478)
7	2B176	Brake fluid reservoir pin bolt
8	2C246	Brake fluid reservoir
9	2L074	Brake fluid reservoir seals (2 required)

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Using a suitable suction device, remove the brake fluid from the remote reservoir.
3. Disconnect the brake fluid level switch electrical connector.
4. Disconnect the hose from the remote reservoir.
5. Remove the 2 nuts and the remote reservoir.
    - To install, tighten to 7 Nm (62 lb-in).
6. Disconnect the brake fluid level switch harness from the brake fluid reservoir.

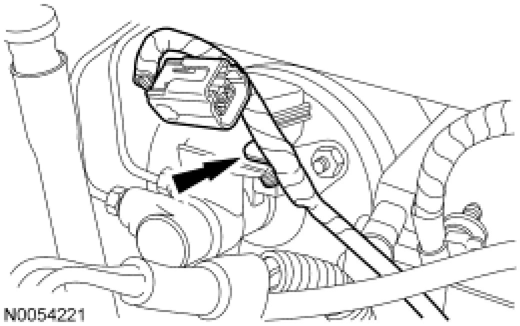

Fig. 6: Locating Brake Fluid Level Switch Harness From Brake Fluid Reservoir
Courtesy of FORD MOTOR CO.

7. Remove the reservoir pin bolt and the brake fluid reservoir.
   - To install, tighten to 6 Nm (53 lb-in).
8. Remove and discard the 2 seals.

NOTE: **Install new seals. Lubricate the seals with clean, specified motor vehicle brake fluid.**

9. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.
   - If equipped with a manual transmission, bleed the clutch master cylinder. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.

BRAKE PRESSURE CONTROL VALVE

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: **Non-ABS shown, ABS similar.**

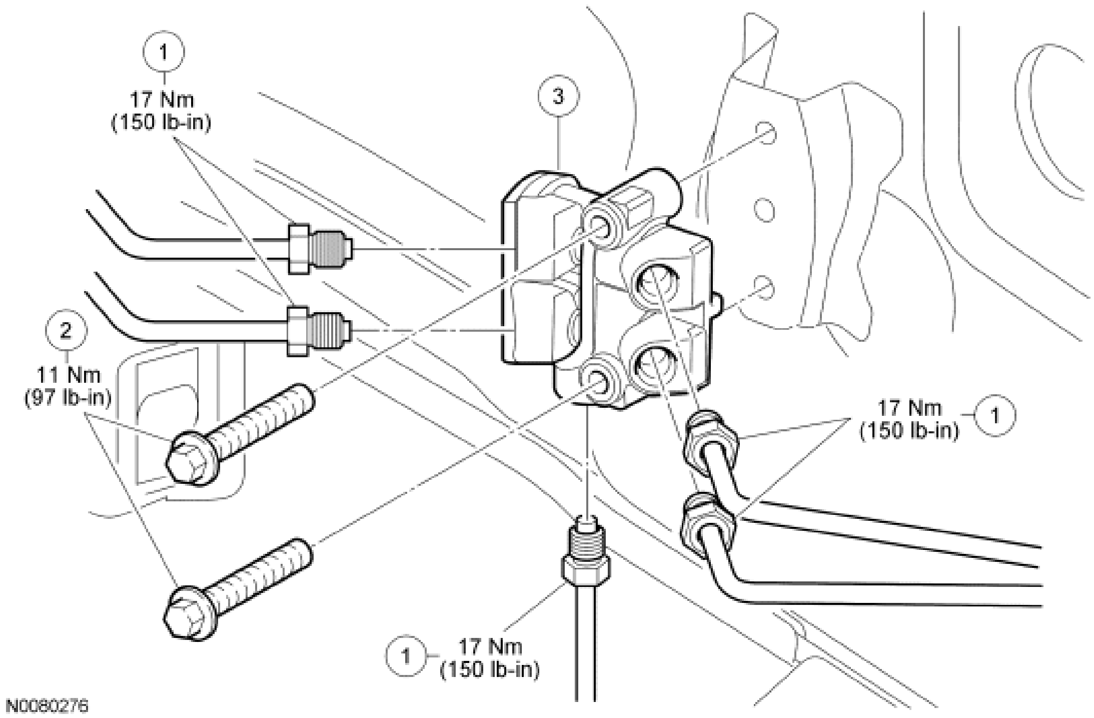

Fig. 7: Exploded View Of Brake Pressure Control Valve With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Brake tube fittings (part of 9J279)
2	W711239	Brake pressure control valve bolts (2 required)
3	43900	Brake pressure control valve

REMOVAL AND INSTALLATION

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the nut and the brake tube heat shield.
3. Disconnect the brake tube fittings, plug the tubes and the ports on the brake pressure control valve.
    - To install, tighten to 17 Nm (150 lb-in).
4. Remove the 2 brake pressure control valve bolts and the brake pressure control valve.
    - To install, tighten to 11 Nm (97 lb-in).
5. To install, reverse the removal procedure.
    - Bleed the brake system. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

DESCRIPTION AND OPERATION

INFORMATION AND ENTERTAINMENT SYSTEM

Audio Line-Up

The following audio systems are available:

- Base
  - AM/FM single CD with MP3
  - 4 speakers
- Mid-Level
  - AM/FM single CD with MP3
  - 6 speakers
- Premium
  - AM/FM 6-CD changer with MP3
  - 6 speakers
- Audiophile
  - AM/FM 6-CD changer with MP3
  - 8 speakers (includes subwoofers)
- THX® Audio
  - AM/FM 6-CD changer with MP3

    - 12 speakers (includes subwoofers and center front/rear speakers)
    - Audio digital signal processing (DSP) module (located on the RH side of the luggage compartment)
- Navigation
    - Navigation audio control module (ACM)
    - Available with Audiophile or THX® audio system

All audio systems include the following features:

- Speed sensitive volume
- Accessory delay
- MP3 capability
- Audio input jack

The following options are also available:

- Steering wheel controls
    - Available with certain audio systems
    - Standard with the SYNC system
- Satellite audio
    - Available as an option with all audio systems
    - Provides satellite-broadcast reception
- SYNC System
    - Provides mobile phone and media device functionality with the vehicle audio system

Antenna

Antenna - Fusion, Milan

The antenna is located at the top-rear of the roof panel. The antenna can be either an AM/FM antenna, or a combination AM/FM/satellite antenna if the vehicle is equipped with satellite audio.

Antenna - MKZ

The AM/FM antenna is located in the rear glass. It cannot be replaced separate from the rear glass.

Satellite Antenna

The satellite antenna (if equipped) is located at the top-rear of the roof panel. The satellite antenna is a stand-alone antenna on the MKZ, and is a combination AM/FM/satellite antenna on the Fusion/Milan.

Antenna Cable

The antenna lead-in cable is connected to the ACM and has an in-line connector (located at the right end of the instrument panel below the glove compartment) to the antenna cable. The antenna cable runs along the

passenger side rocker panel within the body main wiring harness, and runs up the passenger side C-pillar to the antenna module (MKZ) or to the antenna (Fusion, Milan).

The antenna and lead-in cables are not removable from the wiring harnesses. If either antenna cable needs to be replaced, cut the ends and leave the cable in the wiring harness. Route the new cable on top of the wiring harness and secure it with wire ties. Do not cut into the wiring harness to remove the existing antenna cable.

Satellite Antenna Cable

The satellite antenna cable is part of the harness. If it is necessary to install a new satellite antenna cable, the new cable should be overlaid on the harness and secured as necessary.

Satellite Audio

The satellite audio system is comprised of the following:

- Satellite digital audio receiver system (SDARS) module, located behind the RH C-pillar trim panel
- Combination AM/FM/satellite radio antenna (Fusion, Milan)
- Stand-alone satellite radio antenna (MKZ)
- Satellite radio antenna cable

Navigation System

The navigation system is integral to the ACM. The ACM controls the operation of the navigation system and the audio system. The system uses a global positioning system (GPS) antenna, a vehicle speed input, and other sensor information to accurately establish the vehicle position. The ACM provides the visual and audible instructions of the maneuvers required to arrive at the pre-entered destination. An audible switch feedback is provided to confirm if an ACM button or a screen button is pressed. The audible switch feedback can be set to ALL, TOUCH SCREEN, or NONE depending on user preference.

SYNC System

The SYNC system is comprised of the following:

- Accessory protocol interface module (APIM), located under the floor console
- SYNC-specific steering wheel controls
- Microphone located in the rear view mirror
- Universal serial bus (USB) port, located in the center console
- Audio input jack, located in the center console

SYNC is a hands-free communications and entertainment system that allows the following interactions:

- Send and receive phone calls via a Bluetooth®-enabled phone
- Send and receive text messages via a Bluetooth®-enabled phone
- Connect media devices (such as an iPod® or USB flash device) in order to play audio files

- Play media files via a Bluetooth®-enabled audio device

Not all features will be available with every phone.

For additional information on audio system operation, including the SYNC system, refer to the Owner's Literature.

DIAGNOSTIC TESTS

INFORMATION AND ENTERTAINMENT SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent
 ST3051-A	Universal Serial Bus (USB) Male-A To Male-A Cable	CCMUSB2-AM-AM-10

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Audio Control Module (ACM)

The audio control module (ACM) can be operated while the key is in RUN or ACC. The accessory delay feature allows the audio system to be operated for a preset period of time after the key is turned to OFF and a

front door has not been opened. The ACM sends AC voltage audio signals to the speakers or to the amplifiers, depending on vehicle configuration. The ACM can produce its own DTCs, which can be communicated to the scan tool through the medium speed controller area network (MS-CAN), or can be retrieved through the ACM self-test by simultaneously pressing presets 3 and 6.

Satellite Audio

The satellite audio system consists of a satellite digital audio receiver system (SDARS) module, a satellite radio antenna, and a satellite radio antenna cable. The satellite radio antenna receives digital audio signals and sends them to the SDARS module, where the signals are converted and sent to the ACM or the accessory protocol interface module (APIM) (if equipped). The SDARS module communicates via the MS-CAN.

Antenna - Fusion, Milan

The antenna receives AM/FM radio waves, and satellite audio signals (if equipped with satellite audio). The AM/FM antenna sends audio signals to the ACM. The satellite radio antenna receives digital audio signals and sends them to the SDARS module.

Antenna - MKZ

The antenna receives both AM and FM radio waves. The antenna is built into the rear window glass and has a module to interpret the audio signals. The audio signals are then sent to the ACM through the antenna cable. If equipped with satellite audio, the satellite radio antenna is mounted to the roof. It receives digital audio signals and sends them to the SDARS module.

Subwoofer

The subwoofer speakers are powered by the subwoofer amplifier (Audiophile) or by the audio digital signal processing (DSP) module (THX® only). The enable/clip detection circuit carries out 2 functions: to turn the amplifier on, and to indicate to the ACM when the subwoofer output distortion signal reaches a damaging level. The ACM then clips the audio output signal to prevent damage to the subwoofer.

Audio Digital Signal Processing (DSP) Module

The DSP module provides theatre quality sound in the vehicle. Audio signals are sent to the DSP module, which processes the audio signals and sends them to the 12 speakers: 4 door speakers, 2 tweeter speakers, 3 front/center speakers, 1 rear/center speaker, and 2 subwoofer speakers.

Navigation System

The navigation module is integrated in the ACM and controls the operation and the interface between the user, the vehicle subsystems, and the external components. The ACM communicates with other vehicle systems via the MS-CAN and can be diagnosed with a scan tool.

The vehicle navigation system guides the user to a pre-entered destination. A navigation map DVD stored in the navigation module sends route calculation data to the ACM. The ACM audibly and visually instructs the user of the maneuvers required to arrive at the destination entered.

In order to calculate initial vehicle position, the global positioning system (GPS) antenna is used to track several

available satellites simultaneously. Vehicle speed and transmission gear selected signals received through the MS-CAN are also used to detect vehicle speed and direction changes.

A voice recognition system allows the user to interface with the system without using the touch screen. A microphone located in the rear view mirror provides a direct input to the ACM.

SYNC System

The SYNC system allows interaction with several types of customer devices, including mobile phones and media devices. The system is comprised of the APIM, a microphone (located in the interior rear view mirror), the universal serial bus (USB) cable and port, and the audio input jack. The APIM contains an on-board Bluetooth® chipset, which enables certain wireless devices to interact with the system.

The APIM consists of 2 internal modules: the consumer interface processor (CIP) and the vehicle interface processor (VIP). The modules are not replaceable individually, but can be flashed independently, if required.

The CIP interfaces with all of the inputs to the APIM. The CIP contains an analog-to-digital-to-analog converter, as well as the Bluetooth® chipset. Any consumer-available application upgrades that are available are loaded directly to the CIP through the USB port.

The VIP provides an interface between the CIP and the vehicle. The main functions of the VIP are controlling the APIM power management and translating both inbound and outbound signals over the controller area network (CAN).

The APIM can receive inputs from the following audio sources:

- USB port
- Audio input jack
- SDARS module
- Bluetooth®

The USB port can be used for connecting a media device (such as an iPod®) with the device's available cable, or for directly plugging in a portable mass storage device (such as a "thumb drive"). When playing media files stored on a mass storage device, the SYNC system will only play files that do not have digital rights management (DRM) protection. The USB port can also be used for uploading vehicle application upgrades.

The USB port is powered by the APIM, so no external power source is needed to power a device plugged into the USB port if the device supports this feature.

The audio input jack can be used for connecting a media device (such as an iPod®) utilizing a 1/8-inch audio jack. When a device is connected through the audio input jack, only the speaker volume can be controlled by the ACM. All other functions (such as seek, fast forward, pause, etc.) must be carried out on the device itself.

If the vehicle is equipped with satellite audio, the audio signals from the SDARS module are sent to the APIM, rather than directly to the ACM. The APIM then relays the satellite audio signals to the ACM.

The Bluetooth® interface can accommodate both Bluetooth®-enabled mobile phones and Bluetooth®-enabled

media devices. Any Bluetooth® device used with the SYNC system must first be paired with the system before it is operational.

Bluetooth® is a secure, short-range radio frequency that allows devices to communicate wireless through radio waves. The operating range of a Bluetooth® signal is a maximum of 32 feet.

Only one Bluetooth® phone and one Bluetooth® device can be connected to the system at any one time. If an additional device of either type is paired with the system and made active, the APIM will disconnect any active connection and establish a connection with the new device.

It is important to understand that not all mobile phones will have the same level of features when interacting with the SYNC system. For a list of compatible phones, .

In addition to audio information, metadata may also be sent to the APIM from a device plugged into the USB port. Metadata consists of such information as artist, album title, song title, and genre. The metadata is used by the APIM to create indexes that can be used to sort for particular music, based on customer preference. Not all USB devices will send metadata to the APIM; also, no metadata is transferred when a device is connected through the audio input jack. When a new media device is connected to the SYNC system, the APIM will automatically index the information. This may take up to several minutes (depending on the amount of data on the device), and is considered normal operation. When a device that was previously connected to the SYNC system is reconnected, the APIM will update the index (rather than creating a new one), which reduces the amount of time needed to create the index.

The APIM receives both stereo and mono sound inputs, and can also transmit both stereo and mono sound. The mono function is used to receive the microphone input, and to send sound to the ACM for voice prompts, the text-to-speech (TTS) feature, ring tones, and any audio received through a connected mobile phone. The TTS feature speaks information so that it does not have to be read from the display.

The APIM communicates via the MS-CAN.

Voice Recognition For Vehicles With Navigation And The SYNC System

When a vehicle is equipped with both the navigation system and SYNC system, the interaction between the audio system components is unique for voice recognition.

Both the navigation ACM and the APIM utilize voice-recognition, but in order for the modules to determine which one should be acknowledging the voice command, the voice command set is different. This allows the modules to identify the intended source when the VOICE button is pressed. The VOICE (an icon of someone speaking) and PHONE (an icon of a phone and an up-and-down arrow) buttons are wired to the navigation ACM, rather than to the APIM (as they are in non-navigation audio systems).

When the audio system enters voice recognition mode, the ACM sends a CAN message to the APIM to enter voice recognition mode. The microphone is wired directly to the APIM, which relays the microphone input to the ACM through dedicated wiring. Control of the voice functions is given to whichever module is indicated by the first voice command.

Steering Wheel Controls

The steering wheel controls consist of a series of resistors. Each steering wheel control switch function corresponds with a specific resistance value within the switch. When a switch is pressed, the ACM (or the APIM) monitors the change in reference voltage to determine the requested function.

Audio Input Jack - Vehicles Without The SYNC System

The audio input jack allows for a portable MP3 player to be connected to the vehicle audio system. When a portable MP3 player is connected, audio from the MP3 player can be played through the vehicle speakers.

Noise Suppression Equipment

The radio frequency suppression equipment reduces interference transmitted through the speakers by the engine ignition and electrical systems. When installing any new radio suppression equipment components, make sure that a good contact is made at all connections.

Audio Signals

Audio signal flow varies greatly depending on vehicle content.

Stereo signals contain left and right channel information, and are used for most audio signals.

A mono signal is used for the microphone input to the APIM. The mono signal is also used for the voice prompts, the TTS feature, ring tones, and any audio received through a connected mobile phone. These audio signals are output from the APIM to the ACM. The mono and stereo outputs from the APIM utilize separate circuits.

A digital signal is used to transmit data from a media device connected through the USB port to the APIM. The APIM then converts the signal to analog and relays the signal to the ACM.

A wireless signal is used to broadcast audio signals from a Bluetooth® device to the APIM. As with a digital signal sent through the USB port, the APIM converts the wireless audio signal to analog and relays it to the ACM.

Network Communication

The following audio system components communicate via the MS-CAN:

- Audio control module (ACM)
- Navigation ACM
- Satellite digital audio receiver system (SDARS) module
- Audio digital signal processing (DSP) module
- Accessory protocol interface module (APIM)

The following messages are utilized by the audio system:

AUDIO SYSTEM

		Receiving Module	

Message	Transmitting Module	(s)	Audio System Function
Ignition Switch Position	Instrument cluster (IC)	ACM DSP module	Indicates ignition switch position for power-up/shut-down.
Illumination Dimmer Level	Smart junction box (SJB)	ACM	Controls the backlight intensity, based on the position of the dimmer switch.
Transmission Selector (PRNDL) Range	IC	ACM	For the navigation system, this signal is used for more accurate navigation tracking.
Volume Cutback	Parking aid module (PAM)	ACM	When this signal is active, the speaker output is reduced to allow the parking aid tone to be more easily heard.
Accessory Delay Status	SJB	ACM	When active, this signal allows the audio component to be operated after the vehicle is shut off.
Vehicle Speed	IC	ACM DSP module	Used by the ACM (or DSP module) for the speed-compensated volume function.
Navigation Radio Rolling Wheel Count	IC	ACM	For the navigation system, this signal is used to more accurately track vehicle position when the GPS signal is temporarily unavailable.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
	• Smart junction box (SJB) fuse(s): ◦ 12 (7.5A) (accessory delay feed)

• Audio control module (ACM) • Antenna • Audio input jack • Speaker(s) • Steering wheel controls • Universal serial bus (USB) port • Navigation map DVD • Noise suppression equipment	○ 13 (10A) (accessory protocol interface module [APIM]) ○ 17 (20A) (subwoofer amplifier) (Audiophile) ○ 18 (20A) (ACM hot at all times) ○ 20 (7.5A) (satellite digital audio receiver system [SDARS] module hot at all times) ○ 22 (7.5A) (ACM hot in START) • Battery junction box (BJB) fuse(s): ○ 20 (20A) (audio digital signal processing [DSP] module) ○ 21 (20A) (DSP module) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
    - Check the VCM connection to the vehicle.
    - Check the scan tool connection to the VCM.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
    - Verify the ignition key is in the ON position.
    - Verify the scan tool operation with a known good vehicle.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.

NOTE: Do not press any buttons on the ACM while the ACM is carrying out the self-test.

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the ACM.
9. If the DTCs retrieved are related to the concern, go to DTC Charts.
10. If no DTCs related to the concern are retrieved, go to the Speaker Walk-Around Test (All Audio Systems Except Navigation), the Audio Control Module (ACM) Self-Diagnostic Mode (All Audio Systems Except Navigation), the Audio Control Module (ACM) Self-Diagnostic Mode - Navigation, or the Satellite Audio Bezel Diagnostic Test.

Speaker Walk-Around Test (All Audio Systems Except Navigation)

NOTE: To enter the speaker walk-around test or ACM self-diagnostic mode, the audio system must be on and in radio tuner (AM/FM) mode.

1. To enter the speaker walk-around test, simultaneously press the ACM preset buttons 3 and 6.
2. The speaker walk-around test stops at each speaker and applies sound to each speaker for about 1 to 2 seconds. Each speaker is tested and displayed on the ACM in the following sequence: RF, LF, LR, RR, SUBWOOFER, and CENTER IMAGE (THX® audio system only).
3. To exit the speaker walk-around test, turn the key OFF, turn the audio system off, or press preset button 1 for diagnostics.

Audio Control Module (ACM) Self-Diagnostic Mode - All ACMs Without Navigation

NOTE: To enter the ACM self-diagnostic mode, the ACM must be turned on and in radio tuner (AM/FM) mode.

1. To enter the following tests, press the desired preset button while in the speaker walk-around test or while in the ACM self-diagnostic mode.
2. The self-diagnostic mode has the following functions available:
    - Preset button 1 = On-Demand Self-Test. This button runs the on-demand self-test.
        - Pressing the MENU DOWN button allows scrolling of any DTCs found during the test while in this menu.

- Preset button 2 = Display Continuous DTCs. This button enables viewing of any continuous DTCs that have been logged.
  - Pressing the MENU UP button allows scrolling of any DTCs while in this menu.
  - While continuous DTCs are being displayed, pressing the EJECT button will clear all present DTCs.
- Preset button 3 = Signal Strength Test. This button displays the signal strength.
- Preset button 4 = Software Version Display. This button displays the ACM software version.
  - Pressing the MENU UP button allows scrolling of all audio subsystem software versions while in this menu.
- Preset button 5 = Display Test. This test illuminates all the display segments for 5 seconds, then turns all segments off.
- Preset button 6 = Configuration Status. This button enables ACM configuration status.
  - Pressing the MENU button displays the ACM part number while in this menu.

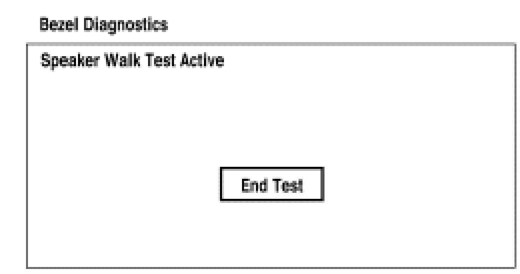
3. To exit the self-diagnostic mode, turn the audio system off or turn the key to OFF.
4. If the concern remains and the fault is not detected, go to **Symptom Chart - Audio System** to continue diagnostics.

Audio Control Module (ACM) Self-Diagnostic Mode - Navigation ACM

The navigation system provides internal self diagnostics to assist with diagnosing vehicle concerns.

Press and hold the 3 and 6 memory preset buttons for 3 seconds.

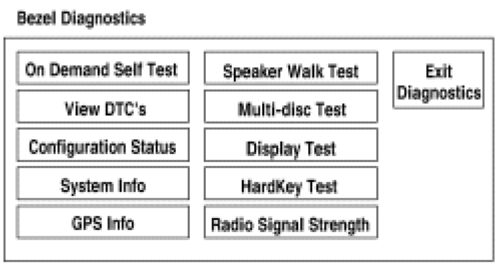
Press the End Test button on the screen to exit the speaker walk test.



N0026636

Fig. 1: Bezel Diagnostics Screen Display - Speaker Walk Test Active
Courtesy of FORD MOTOR CO.

The following diagnostics are available using the on-screen buttons as follows:



N0026635

Fig. 2: Bezel Diagnostics Screen Display - On-Screen Buttons
Courtesy of FORD MOTOR CO.

- On Demand Self Test: provides internal self-test diagnostics and displays all the DTCs resulting from the self-test.
- View DTCs: provides a list of all the DTCs currently stored in memory.
- Configuration Status: displays the current navigation ACM configuration.
- System Info: displays the navigation ACM part number and software information.
- GPS Info: provides satellite and current vehicle information.
- Speaker Walk Test: performs the speaker walk-around test.
- Multi-disc Test: checks the status of the CD player mechanism.
- Display Test: allows the screen colors to be checked, and allows testing of individual display screen touch sectors.
- Hardkey Test: provides the status (active/not active) of the ACM buttons and the touch screen.
- Radio Signal Strength: tests the antenna signal.
- Exit Diagnostics: exists diagnostics and returns to the previously selected function.

1. If the concern remains and the fault is not detected, go to **Symptom Chart - Navigation** to continue diagnostics.

Satellite Audio Bezel Diagnostic Test

NOTE: **To enter the satellite audio bezel diagnostic test, the audio system must be on and in SAT mode.**

1. To enter the satellite audio bezel diagnostic test, simultaneously press and hold the AUX button and preset button 2 (except navigation), or SOUND and preset button 1 (navigation).
2. Upon entering the self-test, the audio system produces 2 continuously alternating tones of different pitch, one for the right channel, then one for the left.
3. The test continues by displaying any DTCs currently present. If no DTCs are present, NO DTCS will be displayed. If there are DTCs present, the ACM will auto-scroll through the list of active DTCs.
4. Historical DTCs can be viewed by pressing the AUX button and preset button 2 (except navigation), or SOUND and preset button 1 (navigation) simultaneously while in the active DTC mode.
    - If any DTCs are present, simultaneously pressing the AUX button and preset button 2 (except

navigation), or SOUND and preset button 1 (navigation) will prompt CLEAR DTCS? on the display.

- To clear historical DTCs, press preset buttons 1, 2, and 3 consecutively within 4 seconds.
- To exit historical DTCs (with or without clearing DTCs), press the AUX button and preset button 2 (except navigation), or SOUND and preset button 1 (navigation) simultaneously.

5. If no historical DTCs are present, pressing the AUX button and preset button 2 (except navigation), or SOUND and preset button 1 (navigation) simultaneously while in active DTC mode will display the DLP software version.
6. To exit the satellite audio bezel diagnostic test, press the AUX button and preset button 2 (except navigation), or SOUND and preset button 1 (navigation) simultaneously while the DLP (SDARS module) software version is displayed, or turn the ACM off.
7. If the concern remains and the fault is not detected, go to **Symptom Chart - Audio System**.

DTC Charts

NOTE: For all U-codes listed in this chart, if no related symptoms are observed, disregard the DTC.

NOTE: For all U-codes listed in this chart, if DTC B1318 is present, diagnose it before diagnosing the U-code DTC.

AUDIO CONTROL MODULE (ACM) DTC CHART

DTC	Description	Action
B1117	Audio Steering Wheel Button Stuck	VERIFY that no steering wheel control switches are stuck and that no steering wheel control button was pressed during the self-test. If no concern is found, go to **Pinpoint Test G**.
B1119 (Navigation only)	Audio Disc DVD Player Thermal Shutdown	**NOTE: This DTC refers to the navigation DVD mechanism, not the DVD entertainment system.** The audio control module (ACM) was over-temperature. Navigation operation will resume after the ACM cools. This is normal operation. CLEAR the DTCs.
B1136 (Navigation only)	Audio Steering Wheel Switch #2 Circuit Failure	Go to **Pinpoint Test G**.
B1140 (Navigation only)	Map Disk Invalid	REMOVE the map DVD and CLEAN it. INSPECT for scratches, fingerprints, or damage, and REPAIR as necessary. VERIFY a valid map DVD is being used. If no concern is found, INSERT a known good map DVD. REPEAT the self-test. ○ If the system operates correctly, the concern was

		caused by a damaged or invalid map DVD. ◦ If DTC B1140 is retrieved again, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
B1318	Battery Voltage Low	CLEAR the DTCs. TEST the charging system. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article. ◦ If the charging system is OK, the DTC was set by a previous low voltage condition. No concern is found at this time. ◦ If the charging system is not OK, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
B2103	Antenna Not Connected	Go to **Pinpoint Test A**.
B2204 (Navigation only)	GPS Antenna Connection Open or Short	Go to **Pinpoint Test K**.
B2274	Phone Transceiver Active Circuit Failure	DISREGARD the DTC. CLEAR the DTCs.
B2384	Audio Reverse Aid Mute Input CKT Failure	DISREGARD the DTC. CLEAR the DTCs.
B2404	Audio Steering Wheel Switch Circuit Fault	Go to **Pinpoint Test G**.
B2405	Audio Disc CD Player Thermal Shutdown Fault	The ACM was over-temperature. Audio operation will resume after the ACM cools. This is normal operation. CLEAR the DTCs.
B2406	Audio Disc CD Player Internal Fault	**NOTE:** **DTC B1342 will also be set.** CLEAR the DTCs. REPEAT the self-test. If DTC B2406 or B1342 is retrieved again, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
B2477	Module Configuration Failure	REFER to **MODULE CONFIGURATION** article.
B2633	Driver-Front Microphone	Go to **Pinpoint Test P**.

(Navigation only)	Circuit Failure	
B2656 (Navigation only)	DVD (Digital Versatile Disk) Error	**NOTE:** **DTC B1342 will also be set.** **NOTE:** **This DTC refers to the navigation DVD mechanism, not the DVD entertainment system.** CLEAR the DTCs. REPEAT the self-test. If DTC B2656 or B1342 is retrieved again, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
B2924	Audio Button Stuck	**NOTE:** **For the navigation system, the hard key test should be used to isolate a stuck button.** VERIFY no ACM buttons are stuck and that no ACM button is pressed during the self-test. CLEAR the DTCs. REPEAT the self-test. If DTC B2924 is retrieved again, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
B2965	Audio System Speaker Circuit Fault	For the THX® audio system, go to **Pinpoint Test C**. For all others, go to **Pinpoint Test B**.
C1992	Vehicle Speed Circuit Failure	DISREGARD the DTC. CLEAR the DTCs.
P0812	Reverse Input Circuit	DISREGARD the DTC. CLEAR the DTCs.
U0140	Lost Communication With Body Control Module (GEM)	If a back lighting concern is present, REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article. If the accessory delay does not function correctly, REFER to **WIPERS AND WASHERS** article.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	If the speed sensitive volume does not operate correctly, go to **Pinpoint Test Q**. If the navigation is inaccurate, go to **Pinpoint Test O**.
U0159	Lost Communication With Parking Assist Control Module (PAM)	Go to **Pinpoint Test N**.
U0193	Lost Communication With Digital Audio Control Module (SDARS)	Go to **Pinpoint Test H**.
U0196	Lost Communication With Entertainment Control Module	DISREGARD the DTC. CLEAR the DTCs.

	- Rear (AUX)	
U0197	Lost Communication With Telephone Control Module	Go to **Pinpoint Test R**.
U0238	Lost Communication With Digital Audio Control Module "D" (DSP)	Go to **Pinpoint Test D**.
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	DISREGARD the DTC. CLEAR the DTCs.
U2050	No Application Present	REFER to **MODULE CONFIGURATION** article.
U2051	One or More Calibration Files Missing/Corrupt	REFER to **MODULE CONFIGURATION** article.
U2473	Unexpected Vehicle Speed (VSS)	Go to **Pinpoint Test O**.

NOTE: For all U-codes listed in this chart, if no related symptoms are observed, disregard the DTC.

NOTE: For all U-codes listed in this chart, if DTC B1318 is present, diagnose it before diagnosing the U-code DTC.

AUDIO DIGITAL SIGNAL PROCESSING (DSP) MODULE DTC CHART

DTC	Description	Action
B1158	Subwoofer #2 Open	Go to **Pinpoint Test C**.
B1317	Battery Voltage High	CLEAR the DTCs. TEST the charging system. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article. ◦ If the charging system is OK, the DTC was set by a previous high voltage condition. No concern is found at this time. ◦ If the charging system is not OK, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the over-charging condition.
B1318	Battery Voltage Low	CLEAR the DTCs. TEST the charging system. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article. ◦ If the charging system is OK, the DTC was set by a previous low voltage condition. No concern is found at this time. ◦ If the charging system is not OK, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new DSP module. REFER to **Audio Digital Signal Processing (DSP) Module**. TEST the system for normal operation.

B2477	Module Configuration Failure	REFER to **MODULE CONFIGURATION** article.
B2913	Audio Subwoofer Not Connected	Go to **Pinpoint Test C**.
B2925	Subwoofer Speaker Short Circuit	Go to **Pinpoint Test C**.
B292A	Subwoofer #2 Speaker Short Circuit	**NOTE:** **Despite the DTC description, this DTC applies to the DSP module clip/enable circuit, not the subwoofer.** Go to **Pinpoint Test C**.
B2965	Audio System Speaker Circuit Fault	If the symptom is no audio from all speakers, go to **Pinpoint Test D**. If the symptom is no audio from one or more (but not all) speakers, go to **Pinpoint Test C**.
C1992	Vehicle Speed Circuit Failure	DISREGARD the DTC. CLEAR the DTCs.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	CARRY OUT the network test using the scan tool. ○ If the scan tool communicates with the IC, go to **Symptom Chart - Audio System** to diagnose the observed symptom. ○ If the scan tool does not communicate with the IC, REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0184	Lost Communication With Radio (ACM)	CARRY OUT the network test using the scan tool. ○ If the scan tool communicates with the ACM, go to **Symptom Chart - Audio System** to diagnose the observed symptom. ○ If the scan tool does not communicate with the ACM, REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.
U2050	No Application Present	REFER to **MODULE CONFIGURATION** article.
U2051	One or More Calibration Files Missing/Corrupt	REFER to **MODULE CONFIGURATION** article.

NOTE: **For all U-codes listed in this chart, if no related symptoms are observed, disregard the DTC.**

NOTE: **For all U-codes listed in this chart, if DTC B1318 is present, diagnose it before diagnosing the U-code DTC.**

SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS) MODULE DTC CHART

DTC	Description	Action
B1031	SDARS Satellite Antenna Open	Go to **Pinpoint Test I**.
B1032	SDARS Satellite Antenna Short	Go to **Pinpoint Test I**.
B1318	Battery Voltage Low	CLEAR the DTCs. TEST the charging system. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article. ○ If the charging system is OK, the DTC was set by a previous low voltage condition. No concern is found at this time. ○ If the charging system is not OK, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new satellite digital audio receiver system (SDARS) module. REFER to **Satellite Digital Audio Receiver System (SDARS) Module**. TEST the system for normal operation.
B2477	Module Configuration Failure	REFER to **MODULE CONFIGURATION** article.
U0184	Lost Communication With Radio (ACM)	Go to **Pinpoint Test H**.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.
U0197	Lost Communication With Telephone Control Module	Go to **Pinpoint Test H**.
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	DISREGARD the DTC. CLEAR the DTCs.
U2050	No Application Present	REFER to **MODULE CONFIGURATION** article.

NOTE: For all U-codes listed in this chart, if no related symptoms are observed, disregard the DTC.

NOTE: For all U-codes listed in this chart, if DTC B1318 is present, diagnose it before diagnosing the U-code DTC.

ACCESSORY PROTOCOL INTERFACE MODULE (APIM) DTC CHART

DTC	Description	Action
B1038	Microphone Input Circuit Failure	Go to **Pinpoint Test V**.

B1117	Audio Steering Wheel Button Stuck	Go to **Pinpoint Test G**.
B1136	Audio Steering Wheel Switch #2 Circuit Failure	Go to **Pinpoint Test G**.
B1317	Battery Voltage High	CLEAR the DTCs. TEST the charging system. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article. o If the charging system is OK, the DTC was set by a previous high voltage condition. No concern is found at this time. o If the charging system is not OK, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnosis the over-charging condition.
B1318	Battery Voltage Low	CLEAR the DTCs. TEST the charging system. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article. o If the charging system is OK, the DTC was set by a previous low voltage condition. No concern is found at this time. o If the charging system is not OK, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnosis the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. CARRY OUT the self-test. If DTC B1342 is retrieved again, INSTALL a new accessory protocol interface module (APIM). REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.
B2477	Module Configuration Failure	REFER to **MODULE CONFIGURATION** article.
U0184	Lost Communication With Radio (ACM)	Go to **Pinpoint Test R**.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	DISREGARD the DTC. CLEAR the DTCs.
U0255	Lost Communication With Front Controls Interface Module	DISREGARD the DTC. CLEAR the DTCs.
U0256	Lost Communication With Front Display Interface Module	DISREGARD the DTC. CLEAR the DTCs.
U2050	No Application Present	REFER to **MODULE CONFIGURATION** article.

U261C	USB #1 Device Error	Go to **Pinpoint Test T**.
U261D	USB #2 Device Error	DISREGARD the DTC. CLEAR the DTCs.

Symptom Chart

Symptom Chart - Audio System

Condition	Possible Sources	Action
• No communication with the audio control module (ACM)	• Fuse • Wiring, terminals or connectors • ACM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the satellite digital audio receiver system (SDARS) module	• Fuse • Wiring, terminals or connectors • SDARS module	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the accessory protocol interface module (APIM)	• Fuse • Wiring, terminals or connectors • APIM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the audio digital signal processing (DSP) module	• Fuse • Wiring, terminals or connectors • DSP module	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The satellite audio is inoperative/does not operate correctly	• Subscription status • Wiring, terminals or connectors • APIM (if equipped) • SDARS module • ACM	• Go to **Pinpoint Test H**.
• The ACM display is blank, but the ACM operates	• ACM	• INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
• The ACM back lighting does not operate correctly	• Back lighting system concern • Wiring, terminals or connectors • ACM	• REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article to continue diagnosis of a single illumination source inoperative.
		• INSPECT the CD for scratches,

• The CD player is inoperative/does not operate correctly	• CD • ACM	fingerprints, a loose paper label, incorrect format, or damage. INSERT a known good CD and TEST the system. • If the system operates correctly, the concern was caused by a damaged CD. • If the system does not operate correctly, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
• Poor reception - AM/FM	• Wiring, terminals or connectors (MKZ only) • Antenna • Antenna cable • Charging system • Ignition system • Noise suppression equipment • Antenna module (MKZ only) • ACM	• Go to **Pinpoint Test A**.
• Poor reception - satellite audio	• Obstructions to the line of sight • Satellite antenna • Satellite antenna cable • SDARS module	• Go to **Pinpoint Test I**.
• No sound while in satellite radio mode	• Satellite radio antenna • Satellite radio antenna cable • SDARS module	• Go to **Pinpoint Test I**.
• Continuous seek/scan in	• RDS/PTY function setting • Antenna • Antenna cable	• Go to **Pinpoint Test A**.

AM/FM	• Noise suppression equipment • ACM	
• Poor quality/distorted/no sound from one or more speakers (not all speakers) - except THX® audio system	• Wiring, terminals or connectors • Speaker • ACM	• Go to **Pinpoint Test B**.
• Poor quality/distorted/no sound from one or more speakers (not all speakers) - THX® audio system	• Fuse • Wiring, terminals or connectors • Speaker • Subwoofer speaker • Audio digital signal processing (DSP) module • ACM	• Go to **Pinpoint Test C**.

• Poor quality/distorted/no sound from all speakers - except THX® audio system	• Wiring, terminals or connectors
	• ACM
		NOTE:
		If DTC B2965 is set in the ACM, the cause of the concern is a short to ground or short to voltage in the circuitry to an individual speaker. Go to Pinpoint Test B.
		• With the key in any position except START, MEASURE the voltage between the ACM C290a-15, circuit CBP13 (GY/BN), harness side and ground.
		  • If any voltage is present, REPAIR the circuit. TEST the system for normal operation.
		  • If no voltage is present, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

• Poor quality/distorted/no	• Fuse • Wiring, terminals or	

sound from all speakers - THX® audio system	connectors • DSP module • ACM	• Go to **Pinpoint Test D**.
• Poor quality/distorted/no sound while in SYNC mode	• Wiring, terminals or connectors • APIM • ACM	• Go to **Pinpoint Test U**.
• The subwoofer is inoperative/does not operate correctly - Audiophile	• Fuse • Wiring, terminals or connectors • Subwoofer speaker • Subwoofer amplifier • ACM	• Go to **Pinpoint Test E**.
• The subwoofer is inoperative/does not operate correctly - THX® audio system	• Fuse • Wiring, terminals or connectors • Speaker • Subwoofer speaker • DSP module • ACM	• Go to **Pinpoint Test C**.
• Loud popping sound when cycling the ignition switch	• Fuse • Wiring, terminals or connectors • Subwoofer amplifier (Audiophile) • DSP module (THX® audio system) • ACM	• Go to **Pinpoint Test F**.
• The steering wheel controls are inoperative/do not operate correctly	• Wiring, terminals or connectors • Clockspring • Steering wheel controls • ACM • APIM (if equipped)	• Go to **Pinpoint Test G**.
	• Speed sensitive	

• The speed sensitive volume does not operate correctly	volume setting • Vehicle speed sensor (VSS) signal concern • ACM	• Go to **Pinpoint Test Q**.
• The audio input jack is inoperative/does not operate correctly	• Wiring, terminals or connectors • Audio input jack • ACM • APIM (if equipped)	• Go to **Pinpoint Test J**.
• The audio does not reduce when the parking aid tone sounds	• Parking aid system concern • ACM	• Go to **Pinpoint Test N**.
• Voice recognition is inoperative/does not operate correctly - vehicles without the SYNC system	• Fuse • Wiring, terminals or connectors • Microphone (part of interior rear view mirror) • Steering wheel controls • ACM	• Go to **Pinpoint Test P**.
• Voice recognition is inoperative/does not operate correctly - vehicles with the SYNC system	• Fuse • Wiring, terminals or connectors • Microphone (part of interior rear view mirror) • Steering wheel controls • ACM (if equipped with navigation) • APIM	• Go to **Pinpoint Test V**.

Symptom Chart - Navigation

Condition	Possible Sources	Action
• No global positioning system (GPS) antenna signal	• GPS antenna • ACM	• Go to **Pinpoint Test K**.
• Navigation screen only displays Dearborn, Michigan	• GPS antenna	• Go to **Pinpoint Test K**.

• The position cursor is inaccurate	• GPS antenna • Vehicle speed sensor (VSS) signal concern • ACM	• Go to **Pinpoint Test O**.
• The audible switch feedback is inoperative	• Audible switch feedback setting • ACM	• Go to **Pinpoint Test L**.
• The voice guidance is inoperative/does not operate correctly	• Incorrect system setting • Wiring, terminals or connectors (THX® only) • DSP module (if equipped) • ACM	• Go to **Pinpoint Test M**.

• The display screen is inoperative	• ACM	• VERIFY the operation of the AM/FM audio.
		  • If the AM/FM audio system does not operate correctly, go to **Symptom Chart - Audio System**.
		  • If the AM/FM audio system operates correctly, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

• Unable to insert or eject map disc	• Map DVD • ACM	• REMOVE the map DVD and CLEAN it. INSPECT for scratches, fingerprints, or damage. If the map DVD is damaged, REPLACE the map DVD. If no damage is found, INSERT a known good map DVD. TEST the system. • If the system operates correctly, the concern was caused by a damaged or inoperable

		map DVD. • If the system does not operate correctly, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
• The screen does not open/close	• Trim panel interference • ACM	• INSPECT the instrument panel center trim panel for interference with the navigation screen, and REPAIR as necessary. If no interference is found, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.
• Voice recognition is inoperative/does not operate correctly - vehicles without the SYNC system	• Fuse • Wiring, terminals or connectors • Microphone (part of interior rear view mirror) • Steering wheel controls • ACM	• Go to **Pinpoint Test P**.
• Voice recognition is inoperative/does not operate correctly - vehicles with the SYNC system	• Fuse • Wiring, terminals or connectors • Microphone (part of interior rear view mirror) • Steering wheel controls • ACM (if equipped with navigation) • APIM	• Go to **Pinpoint Test V**.

Symptom Chart - SYNC System

Condition	Possible Sources	Action
• The SYNC system is completely inoperative	• Audio system concern • Communication network concern • Customer error • Customer device • APIM	• Go to **Pinpoint Test R**.
• Unable to pair Bluetooth® device	• Incompatible Bluetooth® device • Customer error • Customer Bluetooth® device • APIM	• Go to **Pinpoint Test S**.
• An individual Bluetooth® device feature is inoperative	• Customer device compatibility	**NOTE:** **If a Bluetooth® device is able to pair with the SYNC system, there are no concerns with the APIM.** • INSTRUCT the customer to review the device compatibility list on the . Not all phone features are available through the SYNC system. This is normal operation.
• The universal serial bus (USB) port is inoperative/does not operate correctly	• Customer USB device • USB cable and port • APIM	• Go to **Pinpoint Test T**.
• The steering wheel controls are inoperative/do not operate correctly	• Wiring, terminals or connectors • Clockspring • Steering wheel controls • ACM • APIM	• Go to **Pinpoint Test G**.
• The audio input jack is inoperative/does not operate correctly	• Wiring, terminals or connectors • Audio input jack • ACM • APIM	• Go to **Pinpoint Test J**.

• The SYNC system audible prompts are inoperative/do not operate correctly	• Wiring, terminals or connectors • Customer setting • ACM • APIM	**NOTE:** **The audible prompts include the text-to-speech (TTS) feature, voice prompts, and ring tones.** • Go to **Pinpoint Test W**.
• During a phone call, no incoming audio is heard in the vehicle	• Wiring, terminals or connectors • Customer setting • ACM • APIM	• Go to **Pinpoint Test W**.
• Voice recognition is inoperative/does not operate correctly	• Fuse • Wiring, terminals or connectors • Microphone (part of interior rear view mirror) • Steering wheel controls • ACM (if equipped with navigation) • APIM	• Go to **Pinpoint Test V**.
• During a phone call, no outgoing audio is heard on the outside device	• Fuse • Wiring, terminals or connectors • Microphone (part of interior rear view mirror) • APIM	• Go to **Pinpoint Test V**.

Pinpoint Tests

Pinpoint Test A: Poor Reception - AM/FM

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

For MKZ, the radio antenna, integral to the rear window, receives AM and FM radio waves. The antenna module sends the radio waves to the audio control module (ACM) through the antenna cable.

For Fusion and Milan, the antenna receives AM and FM radio waves and transmits them to the ACM through the antenna cable.

For all vehicles, the noise suppression equipment reduces engine ignition and electrical systems interference transmitted through the speakers.

- DTC B2103 (Antenna Not Connected) - sets during the antenna connected test (part of the ACM self-test) when the signal strength is less than the pre-configured threshold value. In order for this DTC to set, the ACM must be tuned to AM, and the self-test must be run with the scan tool.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors (MKZ only)
- Antenna
- Antenna cable
- Charging system
- Ignition system
- Antenna module (MKZ only)
- Noise suppression equipment
- ACM

PINPOINT TEST A: POOR RECEPTION - AM/FM

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

A1 CHECK THE AUDIO SYSTEM RECEPTION

- Check the audio system reception with the engine running, and with the engine off.
- **Does the poor reception only occur with the engine running?**

  YES : Go to A2.

  NO : For Fusion and Milan, go to A7 .

  For MKZ, go to A10 .

A2 CHECK THE NOISE SUPPRESSION EQUIPMENT

- Check all required noise suppression equipment and the radio frequency interference suppression bond for security, cleanliness, and metal-to-metal contact.
- **Are the connections clean, secure, and in metal-to-metal contact?**

  YES : Go to A3.

  NO : CLEAN and SECURE the antenna connections, or INSTALL new noise suppression equipment as needed. TEST the system for normal operation.

A3 CHECK THE CAPACITOR MOUNTING AND CONNECTING CIRCUITS

NOTE:	**The capacitor mounting points are used to complete the electrical circuit and must be mounted securely to clean surfaces.**

- Check the mounting and connecting circuits of the radio ignition interference capacitor for security, cleanliness, and metal-to-metal contact.
- **Are the contacts clean, secure, and in metal-to-metal contact?**

  YES : Go to A4.

  NO : CLEAN and SECURE the connections, or INSTALL a new radio ignition interference capacitor as necessary. TEST the system for normal operation.

A4 CHECK THE RADIO INTERFERENCE CAPACITOR

- Check the operation of the radio interference capacitor by installing a known good component.
- Start the vehicle.
- Operate the audio system in radio tuner (AM/FM) mode.
- **Is the reception OK?**

  YES : INSTALL a new radio interference capacitor. TEST the system for normal operation.

  NO : INSTALL the original radio interference capacitor. Go to A5 .

A5 CHECK THE GENERATOR

- Key in OFF position.
- Check the generator by disconnecting the wiring harness from the voltage regulator.
- Start the engine.
- Operate the audio system in radio tuner (AM/FM) mode.
- **Is the reception OK?**

  YES : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

  NO : Go to A6.

A6 CHECK THE IGNITION CIRCUITS

- Key in OFF position.
- Connect the wiring harness to the voltage regulator.
- Check the ignition circuits for correct routing, grounding, and integrity of the connections.
- **Are the ignition components OK?**

  YES : USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary. TEST the system for normal operation.

  NO : REPAIR the ignition system as necessary. TEST the system for normal operation.

A7 CHECK THE ANTENNA GROUND

- Key in OFF position.
- Measure the resistance between the antenna base and the battery ground cable.
- **Is the resistance less than 5 ohms?**

  YES : Go to A9.

  NO : Go to A8.

A8 CHECK THE ANTENNA CABLE CONNECTIONS

- Check the antenna connections, including the extension cable.
- Check to make sure the antenna is securely mounted to the vehicle body at ground points.
- **Are the connections clean, secure, and in metal-to-metal contact?**

  YES : Go to A9.

  NO : CLEAN and SECURE the antenna connections as necessary. CLEAR the DTCs. REPEAT the self-test.

A9 SUBSTITUTE THE ANTENNA

- Substitute a known good antenna.
- Operate the audio system in radio tuner (AM/FM) mode.
- **Is the reception OK?**

  YES : INSTALL a new antenna. CLEAR the DTCs. REPEAT the self-test.

  NO : TURN the key to OFF. INSTALL the original antenna. Go to A14 .

A10 CHECK THE ANTENNA MODULE POWER CIRCUIT

- Key in OFF position.
- Disconnect: Antenna Module C4194a (MKZ)
- Operate the audio system in radio tuner (AM/FM) mode.

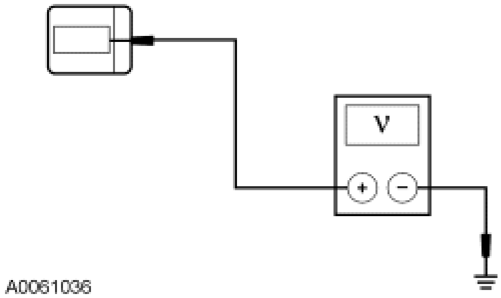


Fig. 3: Checking Antenna Module Power Circuit
Courtesy of FORD MOTOR CO.

- Measure the voltage between the antenna module C4194a-1, circuit CME44 (YE/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A12.

  NO : Go to A11.

A11 CHECK CIRCUIT CME44 (YE/GN) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: ACM C290a or C240a

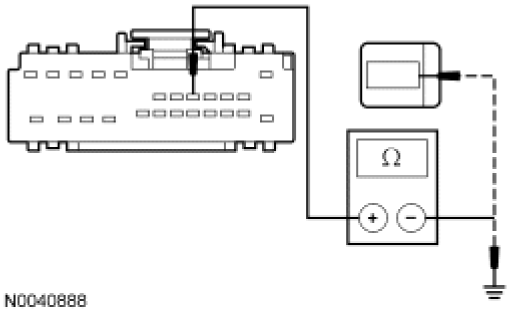

Fig. 4: Checking Circuit CME44 (YE/GN) For An Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the ACM C290a-5 or C240a-5, circuit CME44 (YE/GN), harness side and the antenna module C4194a-1, circuit CME44 (YE/GN), harness side; and between the ACM C290a-5 or C240a-5, circuit CME44 (YE/GN), harness side and ground.
- **Is the resistance less than 5 ohms between the antenna module and the ACM, and greater than 10,000 ohms between the ACM and ground?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

A12 CHECK THE ANTENNA GRID

- Key in OFF position.
- Inspect the antenna grid closely for signs of damage.
- **Is the antenna grid OK?**

  YES : Go to A13.

  NO : REPAIR the antenna grid as necessary. REFER to **GLASS, FRAMES AND MECHANISMS** article. TEST the system for normal operation.

A13 ISOLATE THE ANTENNA MODULE

- Key in OFF position.
- Substitute the antenna module for a known good antenna module.
- Operate the audio system in radio tuner (AM/FM) mode.
- **Is the reception OK?**

  YES : INSTALL a new antenna module. REFER to **Antenna Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL the original antenna module. Go to A14 .

A14 SUBSTITUTE THE ANTENNA LEAD-IN CABLE

- Key in OFF position.
- Substitute a known good antenna lead-in cable.
- Operate the audio system in radio tuner (AM/FM) mode.
- **Is the reception OK?**

  YES : INSTALL a new antenna lead-in cable. CLEAR the DTCs. REPEAT the self-test.

NO : Go to A15.

A15 CHECK FOR CORRECT ACM OPERATION

- Key in OFF position.
- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the ACM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) - Except THX® Audio System

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The audio control module (ACM) directs the audio signals to the speakers through separate positive and negative circuits for each of the 4 audio channels: LH front, RH front, LH rear, and RH rear. The ACM provides internal circuit protection for shorts to ground or shorts to voltage. For vehicles with door tweeter speakers, the speakers are wired in series with the door speakers.

- DTC B2965 (Audio System Speaker Circuit Fault) - sets when a short to ground is detected on any of the speaker circuits. For all audio systems except single CD, DTC B2965 also sets when an open circuit or short to voltage is detected.

For some audio systems, a short to ground or short to voltage in the circuitry to one of the speakers will cause all speakers to lose sound due to the built-in overload protection feature of the ACM. In this case, DTC B2965 will set in the ACM, and this pinpoint test should be followed to isolate the damaged circuit.

For the navigation system, if the voice guidance setting is set to zero rather than to off, it may appear that the front speakers intermittently produce no sound. Make sure the voice guidance setting is not set to zero before addressing a concern with the front speakers.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Speaker
- ACM

PINPOINT TEST B: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) - EXCEPT THX® AUDIO SYSTEM

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 ISOLATE THE SUSPECT SPEAKER

- Carry out the speaker walk-around test.
- **Is the concern with a tweeter speaker?**

YES : Go to B5.

NO : Go to B2.

B2 CHECK THE SPEAKER CIRCUITS FOR VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Speaker
- Operate the audio system in radio tuner (AM/FM) mode.
- Measure the AC voltage between the suspect speaker pin 1 and pin 2, harness side as follows:

Suspect Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C523-1 VME07 (WH or GN/BK)	C523-2 RME07 (WH/BN)
RH front	C612-1 VME10 (WH/VT or VT/BK)	C612-2 RME10 (WH/OG)
LH rear	C702-1 VME09 (BN/GN)	C702-2 RME09 (BN/YE)
RH rear	C802-1 VME12 (BN/WH)	C802-2 RME12 (BN/BU)

- **Is a fluctuating AC voltage present?**

YES : INSTALL a new speaker for the suspect speaker. REFER to **Door Speaker** or **Parcel Shelf Speaker**. CLEAR the DTCs. REPEAT the self-test.

NO : Go to B3.

B3 CHECK THE SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C290a or C240a
- Key in ON position.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C523-1 VME07 (WH or GN/BK)	C523-2 RME07 (WH/BN)
RH front	C612-1 VME10 (WH/VT or VT/BK)	C612-2 RME10 (WH/OG)
LH rear	C702-1 VME09 (BN/GN)	C702-2 RME09 (BN/YE)
RH rear	C802-1 VME12 (BN/WH)	C802-2 RME12 (BN/BU)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B4.

B4 CHECK THE SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the ACM, harness side and the suspect speaker, harness side; and between the ACM, harness side and ground as follows:

Suspect Speaker	ACM Connector-Pin	Speaker Connector-Pin	Circuit
LH front	C290a-8 or C240a-8	C523-1	VME07 (WH)
LH front	C290a-21 or C240a-21	C523-2	RME07 (WH/BN)
RH front	C290a-11 or C240a-11	C612-1	VME10 (WH/VT)
RH	C290a-12 or C240a-	C612-2	RME10

front	12		(WH/OG)
LH rear	C290a-9 or C240a-9	C702-1	VME09 (BN/GN)
LH rear	C290a-22 or C240a-22	C702-2	RME09 (BN/YE)
RH rear	C290a-10 or C240a-10	C802-1	VME12 (BN/WH)
RH rear	C290a-23 or C240a-23	C802-2	RME12 (BN/BU)

- **Are the resistances less than 5 ohms between the ACM and the speaker, and greater than 10,000 ohms between the ACM and ground?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK FOR VOLTAGE TO THE SUSPECT TWEETER SPEAKER

- Key in OFF position.
- Disconnect: Suspect Tweeter Speaker
- Operate the audio system in radio tuner (AM/FM) mode.
- Measure the AC voltage between the suspect tweeter speaker pin 1 and pin 2, harness side as follows:

Suspect Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH tweeter	C569-1 VME08 (GN/OG)	C569-2 RME08 (GY/OG)
RH tweeter	C645-1 VME11 (VT/OG)	C645-2 RME11 (YE/OG)

- **Is a fluctuating AC voltage present?**

  YES : INSTALL a new speaker for the suspect tweeter speaker. REFER to **Door Speaker**. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B6.

B6 CHECK THE TWEETER SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: LF Speaker C513 or RF Speaker C613
- Key in ON position.

- Measure the voltage between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Tweeter Speaker Connector-Pin	Circuit
LH tweeter	C569-1	VME08 (GN/OG)
LH tweeter	C569-2	RME08 (GY/OG)
RH tweeter	C645-1	VME11 (VT/OG)
RH tweeter	C645-2	RME11 (YE/OG)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B7.

B7 CHECK THE TWEETER SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect tweeter speaker, harness side and the respective door speaker, harness side; and between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Tweeter Speaker Connector-Pin	Door Speaker Connector-Pin	Circuit
LH tweeter	C569-1	C513-1	VME08 (GN/OG)
LH tweeter	C569-2	C513-2	RME08 (GY/OG)
RH tweeter	C645-1	C613-1	VME11 (VT/OG)
RH tweeter	C645-2	C613-2	RME11 (YE/OG)

- **Is the resistance less than 5 ohms between the suspect tweeter speaker and the door speaker, and greater than 10,000 ohms between the suspect tweeter speaker and ground?**

  YES : Go to B8.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B8 ISOLATE THE DOOR SPEAKER

- Connect: Suspect Tweeter Speaker
- Install a known good door speaker for the door with the suspect tweeter speaker.

- Operate the audio system in radio tuner (AM/FM) mode.
- **Does the tweeter speaker operate correctly?**

  YES : INSTALL a new door speaker. REFER to **Door Speaker**. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new tweeter speaker. REFER to **Door Speaker**. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) - THX® Audio System

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The audio control module (ACM) directs the audio signals to the audio digital signal processing (DSP) module, which processes the audio signals and sends them to the speakers. Each speaker has a signal and return circuit.

DTC Description	Fault Trigger Conditions
B1158 - Subwoofer #2 Open	Sets when an open is detected on either of the RH subwoofer circuit.
B2913 - Audio Subwoofer Not Connected	Sets when an open is detected on either of the LH subwoofer circuit.
B2925 - Subwoofer Speaker Short Circuit	Sets when a short to ground is detected in the LH subwoofer circuit.
B292A - Subwoofer #2 Speaker Short Circuit	Sets when a short to ground is detected in the RH subwoofer circuit.
B2965 - Audio System Speaker Circuit Failure.	Sets when an open or a short to ground is detected on any of the speaker circuits. It should also be noted that the ACM will not set B2965 when the vehicle is equipped with the THX® audio system

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Speaker
- Subwoofer speaker
- DSP module
- ACM

PINPOINT TEST C: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) - THX® AUDIO SYSTEM

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE AUDIO SIGNALS TO THE SUSPECT SPEAKER

- Key in OFF position.
- Disconnect: Suspect Speaker
- Operate the audio system in radio tuner (AM/FM) mode.
- Measure the AC voltage between the suspect speaker pins, harness side as follows:

Suspect Speaker	Speaker Connector-Pin/ Circuit	Speaker Connector-Pin/ Circuit
LH subwoofer	C3307-1 VME01 (GN/VT)	C3307-2 RME01 (GY)
LR door	C702-1 VME09 (BN/GN)	C702-2 RME09 (BN/YE)
LF door	C523-1 VME07 (WH)	C523-2 RME07 (WH/BN)
LH tweeter	C569-1 VME08 (GN/OG)	C569-2 RME08 (GY/OG)
LH front imaging	C2358-1 VME28 (BN/VT)	C2358-4 RME28 (BN/GN)
Center front imaging	C2358-2 VME06 (GN)	C2358-5 RME06 (GY/YE)
RH front imaging	C2358-3 VME29 (GN/WH)	C2358-6 RME29 (BU/WH)
RH tweeter	C645-1 VME11 (VT/OG)	C645-2 RME11 (YE/OG)
RF door	C612-1 VME10 (WH/VT)	C612-2 RME10 (WH/OG)
RR door	C802-1 VME12 (BN/WH)	C802-2 RME12 (BN/BU)
RH	C3308-1	C3308-2

subwoofer	VME02 (VT)	RME02 (YE)
Rear center imaging	C3306-1 VME30 (GN/BN)	C3306-2 RME30 (VT/BN)

- **Is a fluctuating AC voltage present?**

  YES : INSTALL a new speaker for the suspect speaker. REFER to **Door Speaker**, **Instrument Panel Speaker**, or **Parcel Shelf Speaker** . CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C2.

C2 CHECK THE CIRCUITS TO THE SUSPECT SPEAKER FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSP Module C4326a or C4326b
- Key in ON position.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Speaker Connector-Pin	Speaker Connector-Pin
LH subwoofer	C3307-1	VME01 (GN/VT)
	C3307-2	RME01 (GY)
LR door	C702-1	VME09 (BN/GN)
	C702-2	RME09 (BN/YE)
LF door	C523-1	VME07 (WH)
	C523-2	RME07 (WH/BN)
LH tweeter	C567-1	VME08 (GN/OG)
	C567-2	RME08 (GY/OG)
LH front imaging	C2358-1	VME28 (BN/VT)
	C2358-4	RME28 (BN/GN)
Center front imaging	C2358-2	VME06 (GN)
	C2358-5	RME06 (GY/YE)

RH front imaging	C2358-3	VME29 (GN/WH)
	C2358-6	RME29 (BU/WH)
RH tweeter	C645-1	VME11 (VT/OG)
	C645-2	RME11 (YE/OG)
RF door	C612-1	VME10 (WH/VT)
	C612-2	RME10 (WH/OG)
RR door	C802-1	VME12 (BN/WH)
	C802-2	RME12 (BN/BU)
RH subwoofer	C3306-1	VME30 (GN/BN)
	C3306-2	RME30 (VT/BN)
Rear center imaging	C3308-1	VME02 (VT)
	C3308-2	RME02 (YE)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C3.

C3 CHECK THE CIRCUITS TO THE SUSPECT SPEAKER FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect speaker, harness side and the DSP module, harness side; and between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Speaker Connector-Pin	DSP Module Connector-Pin	Circuit
LH subwoofer	C3307-1 C3307-2	C4326b-16 C4326b-17	VME01 (GN/VT) RME01 (GY)
			VME09

LR door	C702-1 C702-2	C4326b-7 C4326-6	(BN/GN) RME09 (BN/YE)
LF door	C523-1 C523-2	C4326b-3 C4326b-2	VME07 (WH) RME07 (WH/BN)
LH tweeter	C567-1 C567-2	C4326a-9 C4326a-10	VME08 (GN/OG) RME08 (GY/OG)
LH front imaging	C2358-1 C2358-4	C4326a-2 C4326a-1	VME28 (BN/VT) RME28 (BN/GN)
Center front imaging	C2358-2 C2358-5	C4326a-4 C4326a-3	VME06 (GN) RME06 (GY/YE)
RH front imaging	C2358-3 C2358-6	C4326a-6 C4326a-5	VME29 (GN/WH) RME29 (BU/WH)
RH tweeter	C645-1 C645-2	C4326a-11 C4326a-12	VME11 (VT/OG) RME11 (YE/OG)
RF door	C612-1 C612-2	C4326b-5 C4326b-4	VME10 (WH/VT) RME10 (WH/OG)
RR door	C802-1 C802-2	C4326b-18 C4326b-19	VME12 (BN/WH) RME12 (BN/BU)
RH subwoofer	C3306-1 C3306-2	C4326a-13 C4326a-14	VME30 (GN/BN) RME30 (VT/BN)
Rear center imaging	C3308-1 C3308-2	C4326b-14 C4326b-15	VME02 (VT) RME02 (YE)

- **Is the resistance less than 5 ohms between the suspect speaker and the DSP module, and greater than 10,000 ohms between the suspect speaker and ground?**

YES : Go to C4.

NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C4 ISOLATE THE SUSPECT SPEAKER

- Key in OFF position.
- Connect: DSP Module C4326a and C4326b
- Substitute a known good speaker for the suspect speaker.
- Operate the audio system in radio tuner (AM/FM) mode.
- **Is the concern still present?**

  YES : INSTALL the original speaker. Go to C5 .

  NO : INSTALL a new speaker for the suspect speaker. REFER to **Door Speaker**, **Instrument Panel Speaker**, or **Parcel Shelf Speaker** . CLEAR the DTCs. REPEAT the self-test.

C5 CHECK FOR CORRECT DSP MODULE OPERATION

- Key in OFF position.
- Disconnect all the DSP module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the DSP module connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSP module. REFER to **Audio Digital Signal Processing (DSP) Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: Poor Quality/Distorted/No Sound From All Speakers - THX® Audio System

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The audio control module (ACM) enables the audio digital signal processing (DSP) module through circuit CME27 (YE/VT). The DSP module receives voltage through circuits SBB20 (GN/RD) and SBB21 (GY/RD), and ground through circuit GD148 (BK/YE).

Left and right channel audio signals are sent from the ACM to the DSP module through circuits VME17 (GN), RME17 (GY), VME18 (VT), and RME18 (YE). If there is a fault on one of these circuits, the audio quality will be reduced approximately 25% for all speakers.

The enable/clip circuit CME27 (YE/VT) carries out 2 functions: to turn the DSP module on, and to monitor an overload condition to the DSP module. In the event of an overload, the ACM clips the audio output signal to the DSP module (heard as distortion).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DSP module
- ACM

PINPOINT TEST D: NO SOUND FROM ALL SPEAKERS - THX® AUDIO SYSTEM

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK CIRCUITS SBB20 (GN/RD) AND CIRCUIT SBB21 (GY/RD) FOR VOLTAGE

- Key in OFF position.
- Disconnect: DSP Module C4326b
- Measure the voltage between the DSP module, harness side and ground as follows:

Connector-Pin	Circuit
C4326b-9	SBB21 (GY/RD)
C4326b-10	SBB21 (GY/RD)
C4326b-11	SBB20 (GN/RD)
C4326b-12	SBB20 (GN/RD)

- **Are the voltages greater than 10 volts?**

  YES : Go to D2.

  NO : VERIFY the battery junction box (BJB) fuse 20 (20A) or fuse 21 (20A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D2 CHECK CIRCUIT GD148 (BK/YE) FOR AN OPEN

- Measure the resistance between the DSP module, harness side and ground as follows:

Connector-Pin	Circuit
C4326b-22	GD148 (BK/YE)

C4326b-23	GD148 (BK/YE)
C4326b-24	GD148 (BK/YE)

- **Are the resistances less than 5 ohms?**

  YES : Go to D3.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D3 CHECK CIRCUIT CME27 (YE/VT) FOR VOLTAGE

- Operate the audio system in radio tuner (AM/FM) mode.

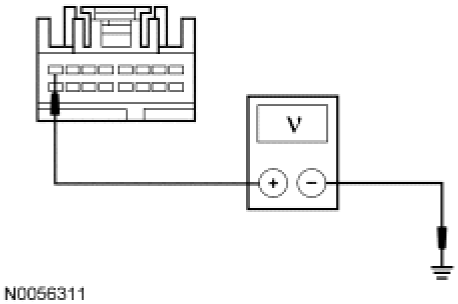

Fig. 5: Checking Circuit CME27 (YE/VT) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DSP module C4326c-8, circuit CME27 (YE/VT), harness side and ground.
- **Is the voltage between 3.8 and 6.7 volts?**

  YES : Go to D5.

  NO : Go to D4.

D4 CHECK CIRCUIT CME27 (YE/VT) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: ACM C240d

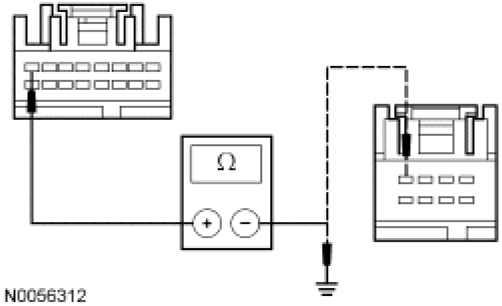

Fig. 6: Checking Circuit CME27 (YE/VT) For An Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DSP module C4326c-8, circuit CME27 (YE/VT), harness side and the ACM C240d-4, circuit CME27 (YE/VT), harness side; and between the DSP module C4326c-8, circuit CME27 (YE/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the DSP module and the ACM, and greater than 10,000 ohms between the DSP module and ground?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

D5 CHECK THE AUDIO SIGNALS TO THE DSP MODULE

- Operate the audio system in radio tuner (AM/FM) mode.
- Measure the AC voltage between the audio circuits at the DSP module as follows:

Suspect Speaker Bank	DSP Module Connector-Pin	Circuit
LH	C4326c-1	VME17 (GN)
	C4326c-2	RME17 (GY)
RH	C4326c-3	VME18 (VT)
	C4326c-4	RME18 (YE)

- **Is a fluctuating AC voltage present?**

  YES : Go to D8.

  NO : Go to D6.

D6 CHECK THE AUDIO CIRCUITS TO THE DSP MODULE FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C240a
- Key in ON position.
- Measure the voltage between the DSP module, harness side and ground as follows:

Connector-Pin	Circuit
C4326c-1	VME17 (GN)
C4326c-2	RME17 (GY)
C4326c-3	VME18 (VT)

C4326c-4	RME18 (YE)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to D7.

D7 CHECK THE AUDIO CIRCUITS TO THE DSP MODULE FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the DSP module, harness side and the ACM, harness side; and between the DSP module, harness side and ground as follows:

DSP Module Connector-Pin	ACM Connector-Pin	Circuit
C4326c-1	C240a-8	VME17 (GN)
C4326c-2	C240a-21	RME17 (GY)
C4326c-3	C240a-11	VME18 (VT)
C4326c-4	C240a-12	RME18 (YE)

- **Is the resistance less than 5 ohms between the DSP module and the ACM, and greater than 10,000 ohms between the DSP module and ground?**

  YES : Go to D9.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D8 CHECK FOR CORRECT ACM OPERATION

- Key in OFF position.
- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the ACM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

D9 CHECK FOR CORRECT DSP MODULE OPERATION

- Key in OFF position.
- Disconnect all the DSP module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the DSP module connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSP module. REFER to **Audio Digital Signal Processing (DSP) Module**. CLEAR the ACM DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Subwoofer is Inoperative/Does Not Operate Correctly - Audiophile

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The subwoofer speakers are powered by a separate subwoofer amplifier. The subwoofer amplifier receives voltage through circuit CBP06 (WH/BU), and ground through circuit GD148 (BK/YE).

To enable the subwoofer amplifier, the audio control module (ACM) sends voltage through the enable/clip circuit SME23 (VT/RD). The circuit acts as both an output (to enable the amplifier) and an input (to detect an amplifier overload condition). A variable resistor in the subwoofer amplifier modifies the voltage signal from the ACM. In the event of an overload, the ACM clips the audio output signal to the amplifier (heard as distortion), in order to prevent damage to the amplifier and the subwoofer speaker.

The clip/enable status is based on the following voltages, as detected by the ACM:

- Less then 0.4 volts: amplifier disabled
- Between 3.8 and 6.7 volts: amplifier enabled
- Greater than 8.5 volts: amplifier clipped

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors

- Subwoofer speaker
- Subwoofer amplifier
- ACM

PINPOINT TEST E: THE SUBWOOFER IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - AUDIOPHILE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 DETERMINE THE INOPERATIVE SUBWOOFER

- Key in ON position.
- Operate the audio system in radio tuner (AM/FM) mode and observe the subwoofer operation.
- **Do both of the subwoofers have a concern?**

  YES : Go to E2.

  NO : Go to E10.

E2 CHECK CIRCUIT CBP06 (WH/BU) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Subwoofer Amplifier C466a

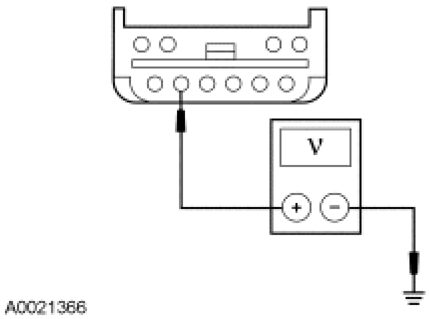

Fig. 7: Checking Circuit CBP06 (WH/BU) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the subwoofer amplifier C466a-5, circuit CBP06 (WH/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E3.

  NO : VERIFY the smart junction box (SJB) fuse 17 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

E3 CHECK CIRCUIT GD148 (BK/YE) FOR AN OPEN

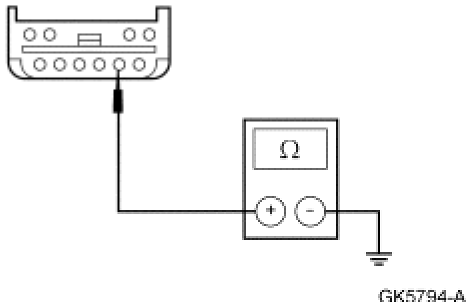

Fig. 8: Checking Circuit GD148 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the subwoofer amplifier C466a-2, circuit GD148 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E4.

  NO : REPAIR the circuit. TEST the system for normal operation.

E4 CHECK CIRCUIT SME23 (VT/RD) FOR VOLTAGE

- Key in ON position.
- Operate the audio system in radio tuner (AM/FM) mode.

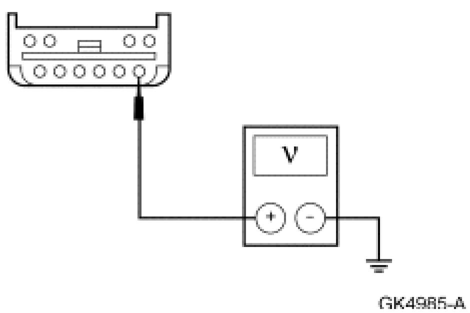

Fig. 9: Checking Circuit SME23 (VT/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and ground.
- **Is the voltage between 3.8-6.7 volts?**

  YES : If the subwoofers have poor quality/distorted sound, go to E7 .

  If the subwoofers have no sound, INSTALL a new subwoofer amplifier. REFER to **Subwoofer Amplifier**. TEST the system for normal operation.

  NO : Go to E5.

E5 CHECK CIRCUIT SME23 (VT/RD) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

- Disconnect: ACM C290d

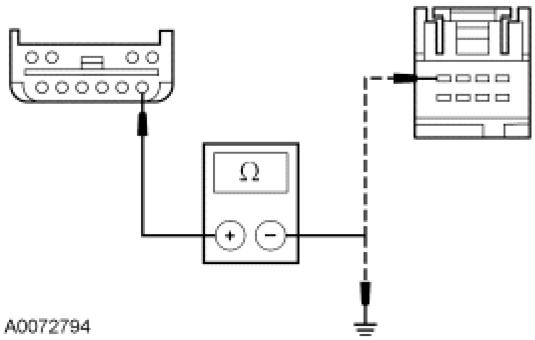

Fig. 10: Checking Circuit SME23 (VT/RD) For An Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and the ACM C290d-4, circuit SME23 (VT/RD), harness side; and between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and ground.
- **Is the resistance less than 5 ohms between the subwoofer amplifier and the ACM, and greater than 10,000 ohms between the subwoofer amplifier and ground?**

  YES : Go to E6.

  NO : REPAIR the circuit. TEST the system for normal operation.

E6 CHECK CIRCUIT SME23 (VT/RD) FOR A SHORT TO VOLTAGE

- Key in ON position.

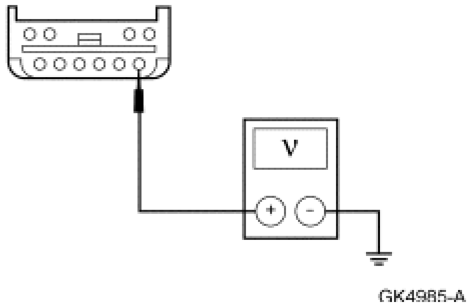

Fig. 11: Checking Circuit SME23 (VT/RD) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and ground.
- **Is any voltage present?**

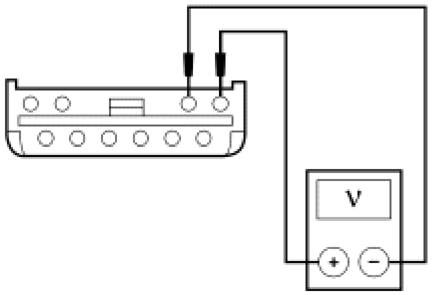
  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

E7 CHECK THE AUDIO SIGNAL TO THE SUBWOOFER AMPLIFIER

- Key in OFF position.

- Key in ON position.
- Operate the audio system in radio tuner (AM/FM) mode.



A0057176

Fig. 12: Checking Audio Signal To Subwoofer Amplifier
Courtesy of FORD MOTOR CO.

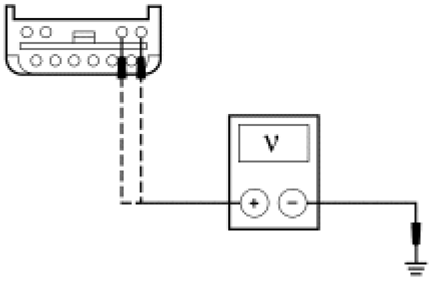
- Measure the AC voltage between the subwoofer amplifier C466a-7, circuit VME22 (VT/GN), harness side and the subwoofer amplifier C466a-8, circuit RME22 (GN/WH), harness side.
- **Is a fluctuating AC voltage present?**

  YES : INSTALL a new subwoofer amplifier. REFER to **Subwoofer Amplifier**. TEST the system for normal operation.

  NO : Go to E8.

E8 CHECK THE AUDIO CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C290d
- Key in ON position.



N0035293

Fig. 13: Checking Audio Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the subwoofer amplifier C466a-7, circuit VME22 (VT/GN), harness side and ground; and between the subwoofer amplifier C466a-8, circuit RME22 (GN/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

NO : Go to E9.

E9 CHECK THE AUDIO CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the subwoofer amplifier, harness side and the ACM, harness side; and between the subwoofer amplifier, harness side and ground as follows:

Subwoofer Amplifier Connector-Pin	ACM Connector-Pin	Circuit
C466a-7	C290d-1	VME22 (VT/GN)
C466a-8	C290d-2	RME22 (GN/WH)

- **Is the resistance less than 5 ohms between the subwoofer amplifier and the ACM, and greater than 10,000 ohms between the subwoofer amplifier and ground?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

E10 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SUBWOOFER SPEAKER FOR VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Subwoofer Speaker
- Key in ON position.
- Operate the audio system in radio tuner (AM/FM) mode.

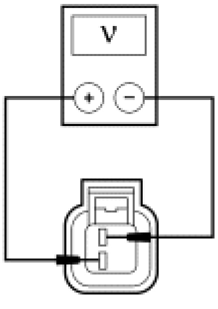


Fig. 14: Checking Audio Circuits To Suspect Subwoofer Speaker For Voltage
Courtesy of FORD MOTOR CO.

- Measure the AC voltage between the LH subwoofer speaker C3120-1, circuit VME01 (GN/VT), harness side and the LH subwoofer speaker C3120-2, circuit RME01 (GY), harness side; or between the RH subwoofer speaker C3121-1, circuit VME02 (VT), harness side and the RH subwoofer speaker C3121-2, circuit RME02 (YE), harness side.

- **Is a fluctuating AC voltage present?**

  YES : INSTALL a new subwoofer speaker for the suspect speaker. REFER to **Subwoofer Speaker**. TEST the system for normal operation.

  NO : Go to E11.

E11 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SUBWOOFER SPEAKER FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Subwoofer Amplifier C466b
- Key in ON position.
- Measure the voltage between the suspect subwoofer speaker, harness side and ground as follows:

Suspect Subwoofer Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH	C3120-1 VME01 (GN/VT)	C3120-2 RME01 (GY)
RH	C3121-1 VME02 (VT)	C3121-2 RME02 (YE)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to E12.

E12 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SUBWOOFER SPEAKER FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect subwoofer speaker, harness side and the subwoofer amplifier, harness side; and between the suspect subwoofer speaker, harness side and ground as follows:

Suspect Subwoofer Speaker	Subwoofer Speaker Connector-Pin	Subwoofer Amplifier Connector-Pin	Circuit
LH	C3120-1	C466b-1	VME01 (GN/VT)
LH	C3120-2	C466b-2	RME01 (GY)
RH	C3121-1	C466b-3	VME02 (VT)
RH	C3121-2	C466b-4	RME02 (YE)

- **Is the resistance less than 5 ohms between the suspect subwoofer speaker and the subwoofer amplifier, and greater than 10,000 ohms between the suspect subwoofer speaker and ground?**

  YES : INSTALL a new subwoofer amplifier. REFER to **Subwoofer Amplifier**. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test F: Loud Popping Sound When Cycling The Ignition Switch

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

Voltage is sent through the start input circuit CBP13 (GY/BN) to the audio control module (ACM) with the key in START. Upon receiving this signal, the ACM mutes all speaker outputs to eliminate the possibility of speaker pops during engine cranking.

For the Audiophile audio system, the ACM disables the subwoofer while the key is in START by keeping the enable signal below 0.4 volts on circuit SME23 (VT/RD).

For the THX® audio system, the ACM disables the audio digital signal processing (DSP) module while the key is in START by keeping the enable signal below 0.4 volts on circuit SME23 (VT/RD).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Subwoofer amplifier (Audiophile)
- DSP module (THX® audio system)
- ACM

PINPOINT TEST F: LOUD POPPING SOUND WHEN CYCLING THE IGNITION SWITCH

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

F1 CHECK CIRCUIT CBP13 (GY/BN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: ACM C290a or C240a
- Disconnect: Starter Relay
- Key in START position.

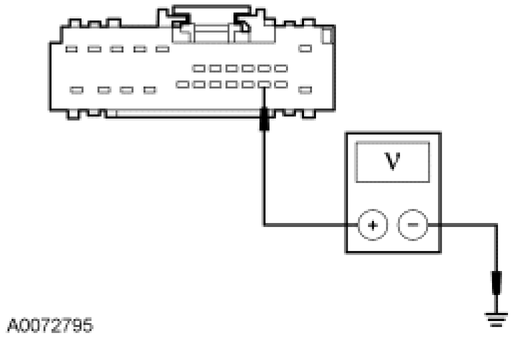

Fig. 15: Checking Circuit CBP13 (GY/BN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ACM C290a-15 or C240a-15, circuit CBP13 (GY/BN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : For the Audiophile audio system, go to F2 .

  For the THX® audio system, go to F3 .

  For all others, INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : VERIFY the smart junction box (SJB) fuse 22 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

F2 ISOLATE THE SUBWOOFER AMPLIFIER

- Key in OFF position.
- Connect: ACM C290a
- Connect: Starter Relay
- Disconnect: Subwoofer Amplifier C466a
- Cycle the key through all of the ignition switch positions.
- **Is a loud popping sound present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : INSTALL a new subwoofer amplifier. REFER to **Subwoofer Amplifier**. TEST the system for normal operation.

F3 ISOLATE THE DSP MODULE

- Key in OFF position.
- Connect: ACM C240a
- Connect: Starter Relay
- Disconnect: DSP Module C4326b
- Cycle the key through all of the ignition switch positions.
- **Is a loud popping sound present?**

YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

NO : Go to F4.

F4 CHECK FOR CORRECT DSP MODULE OPERATION

- Key in OFF position.
- Disconnect all the DSP module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the DSP module connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSP module. REFER to **Audio Digital Signal Processing (DSP) Module**. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Steering Wheel Controls Are Inoperative/Do Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

There are 4 different steering wheel controls configurations:

- Non-navigation, without SYNC
- Non-navigation, with SYNC
- Navigation, without SYNC
- Navigation, with SYNC

The VOL-, VOL+, SEEK-, SEEK+, and MEDIA buttons are always wired to the audio control module (ACM). Voltage is sent from the ACM to the steering wheel controls through circuit VME14 (GY/YE), and the ACM ground the reference voltage through circuit RME24 (BU/WH).

For vehicles equipped with navigation, but not the SYNC system, the VOICE button is wired to the ACM.

For vehicles equipped with the SYNC system, the VOICE (an icon of someone speaking), PHONE (an icon of a phone with an up and down arrow), and OK buttons are wired directly to the accessory protocol interface module (APIM) unless the vehicle is equipped with navigation, in which case there is no OK button, and the VOICE and PHONE buttons are wired to the ACM. Voltage is sent from the APIM (or ACM if equipped with

navigation) to the steering wheel controls through circuit VME54 (BU/OG), and the APIM (or ACM if equipped with navigation) grounds the reference voltage through circuit RME24 (BU/WH) (which is circuit RME54 [WH/VT] at the steering wheel controls).

For all configurations, when a switch is pressed, the voltage is routed through a specific resistor value for each function. The ACM (or APIM) then uses the reference voltage to determine which control input function has been selected.

- DTC B1117 (Audio Steering Wheel Button Stuck) - set by the ACM or the APIM (depending on vehicle configuration) when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground on VME14 (GY/YE) should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B1136 or B2404 being set.
- DTC B1136 (Audio Steering Wheel Switch #2 Circuit Failure) - set by the ACM or the APIM (depending on vehicle configuration) when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck button or a short to ground in circuit RME24 (BU/WH). This DTC only applies to the VOICE, PHONE, and OK buttons.
- DTC B2404 (Audio Steering Wheel Switch Circuit Fault) - set by the ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck button a short to ground in circuit RME24 (BU/WH). This DTC only applies to the VOL-, VOL+, SEEK-, SEEK+, and MEDIA buttons.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Steering wheel controls
- ACM
- APIM (if equipped)

PINPOINT TEST G: THE STEERING WHEEL CONTROLS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

G1 DETERMINE THE INOPERATIVE STEERING WHEEL CONTROLS

- Determine which steering wheel controls are inoperative by pressing each steering wheel control button individually while operating the audio system in various modes (AM/FM, SYNC, etc.).
- **Is the concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA button?**

  YES : Go to G2.

  NO : Go to G3.

G2 MONITOR THE STEERING WHEEL CONTROL PIDs (EXCEPT NAVIGATION/SYNC SWITCHES)

- Enter the following diagnostic mode on the diagnostic tool: ACM DataLogger
- Monitor the steering wheel controls PIDs while pressing each steering wheel controls button as follows:

Steering Wheel Controls Button	PID
VOL-	VOL_DN
VOL+	VOL_UP
SEEK-	SEEK_DN
SEEK+	SEEK_UP
MEDIA	MODE_SW

- **Do the PID values agree with the switch positions?**

  YES : Go to G8.

  NO : If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to **Steering Wheel Controls**. CLEAR any DTCs present. TEST the system for normal operation.

  Otherwise, go to G4.

G3 MONITOR THE STEERING WHEEL CONTROL PIDs (NAVIGATION/SYNC SWITCHES)

- Enter the following diagnostic mode on the diagnostic tool: ACM DataLogger (With Navigation) or APIM DataLogger (Without Navigation)
- Monitor the steering wheel controls PIDs while pressing each steering wheel controls button as follows:

Steering Wheel Controls Button	APIM PID
VOICE	VOICE_SW
PHONE	PHONE_SW
OK (without navigation only)	OK_SW

- **Do the PID values agree with the switch positions?**

  YES : For vehicle with navigation, go to G8.

  For vehicles without navigation, go to G9.

NO : If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to **Steering Wheel Controls**. CLEAR any DTCs present. TEST the system for normal operation.

Otherwise, go to G4.

G4 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE CLOCKSPRING FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Clockspring C218a
- Disconnect: ACM C290a or C240a, or APIM C3338
- Key in ON position.

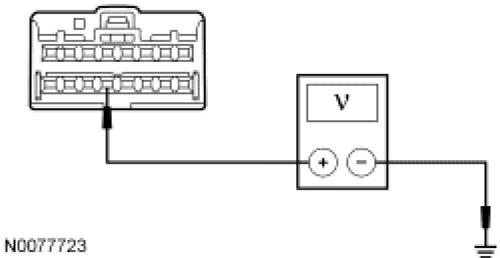

Fig. 16: Measuring Voltage Between Clockspring C218A-13, Circuit VME14 (GY/YE)
Courtesy of FORD MOTOR CO.

- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA buttons, measure the voltage between the clockspring C218a-13, circuit VME14 (GY/YE), harness side and ground.

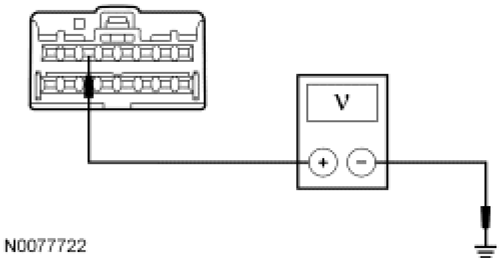

Fig. 17: Measuring Voltage Between Clockspring C218A-6, Circuit VME54 (BU/OG)
Courtesy of FORD MOTOR CO.

- For a concern with the VOICE, PHONE, or OK buttons, measure the voltage between the clockspring C218a-6, circuit VME54 (BU/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal

operation.

NO : Go to G5.

G5 CHECK THE CIRCUITS TO THE CLOCKSPRING FOR AN OPEN OR SHORT TO GROUND

NOTE: Circuit RME24 (BU/WH) does not need to be checked for a short to ground.

- Key in OFF position.
- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA buttons, measure the resistance between the ACM, harness side and the clockspring, harness side; and between the ACM, harness side and ground as follows:

ACM Connector-Pin	Clockspring Connector-Pin	Circuit
C290a-18 or C240a-18	C218a-13	VME14 (GY/YE)
C290a-19 or C240a-19	C218a-12	RME24 (BU/WH)

- For a concern with the VOICE, PHONE, or OK buttons, measure the voltage between ACM (with navigation) or APIM (without navigation), harness side and the clockspring, harness side; and between the ACM (with navigation) or APIM (without navigation), harness side and ground as follows:

ACM or APIM Connector-Pin	Clockspring Connector-Pin	Circuit
C290a-17, C240a-17, or C3338-14	C218a-6	VME54 (BU/OG)
C290a-16, C240a-16, or C3338-15	C218a-4	RME24 (BU/WH)

- **Is the resistance less than 5 ohms between the ACM (or APIM) and the clockspring, and greater than 10,000 ohms between the ACM (or APIM) and ground?**

  YES : Go to G6.

  NO : REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

G6 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE STEERING WHEEL CONTROLS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Clockspring C218b
- Disconnect: Steering Wheel Controls C2999
- Key in ON position.
- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA buttons, measure the voltage between the clockspring C218b-10, circuit VME14 (GY/YE), harness side and ground.
- For a concern with the VOICE, PHONE, or OK buttons, measure the voltage between the clockspring C218b-3, circuit VME54 (BU/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation.

  NO : Go to G7.

G7 CHECK THE CIRCUITS TO THE STEERING WHEEL CONTROLS FOR AN OPEN OR SHORT TO GROUND

NOTE: **Circuits RME24 (BU/WH) and RME54 (WH/VT) do not need to be checked for a short to ground.**

- Key in OFF position.
- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA buttons, measure the resistance between the clockspring, harness side and the steering wheel controls, harness side; and between the clockspring, harness side and ground as follows:

Clockspring Connector-Pin	Steering Wheel Controls Connector-Pin	Circuit
C218b-10	C2999-2	VME14 (GY/YE)
C218b-11	C2999-4	RME24 (BU/WH)

- For a concern with the VOICE, PHONE, or OK buttons, measure the voltage between clockspring, harness side and the steering wheel controls, harness side; and between the clockspring, harness side and ground as follows:

Clockspring Connector-Pin	Steering Wheel Controls Connector-Pin	Circuit

C218b-3	C2999-6	VME54 (BU/OG)
C218b-5	C2999-7	RME54 (WH/VT)

- **Is the resistance less than 5 ohms between the clockspring and the steering wheel controls, and greater than 10,000 ohms between the clockspring and ground?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR any DTCs present. TEST the system for normal operation.

  NO : REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

G8 CHECK FOR CORRECT ACM OPERATION

- Key in OFF position.
- Connect: Any Disconnected Connectors
- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present. REPEAT the self-test.

G9 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose

or corroded connector. CLEAR any DTCs present. REPEAT the self-test.

Pinpoint Test H: The Satellite Audio Is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The satellite digital audio receiver system (SDARS) module receives voltage through circuit SBP15 (WH/RD) and ground through circuit GD148 (BK/YE). Digital signals are received by the satellite radio antenna and sent to the SDARS module, which converts the signals to analog and sends them to either the audio control module (ACM) or to the accessory protocol interface module (APIM) (if equipped).

If there is an open in the satellite antenna circuit, there will be no satellite audio. The ACM display will indicate a satellite antenna concern (the method varies according to the type of ACM) when the audio system is operated in satellite radio mode. To diagnose an open in the satellite antenna circuit, go to **Pinpoint Test I**.

The SDARS module transmits left and right channel audio signals. When there is a fault in any of the audio signal circuits, the audio quality is reduced. If the circuits for a specific channel are shorted together, loss of audio on the entire channel will occur. This can be detected by using the SDARS module tones test.

- DTC U0184 (Lost Communication With Radio [ACM]) - set by the SDARS module when certain medium speed controller area network (MS-CAN) messages are missing from the ACM for greater than 5 seconds.
- DTC U0193 (Lost Communication With Digital Audio Control Module [SDARS]) - set by the ACM when certain MS-CAN messages are missing from the SDARS module for greater than 5 seconds.
- DTC U0197 (Lost Communication With Telephone Control Module) - set by the SDARS module when certain MS-CAN messages are missing from the APIM for greater than 5 seconds.

This pinpoint test is intended to diagnose the following:

- Subscription status
- Wiring, terminals or connectors
- SDARS module
- APIM (if equipped)
- ACM

PINPOINT TEST H: THE SATELLITE AUDIO IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

H1 VERIFY AN ACTIVE SUBSCRIPTION

- Operate the audio system in satellite radio mode and observe the display.

- **Does the display read CALL SIRIUS?**

  YES : The subscription has expired. INFORM the customer to contact Sirius to re-activate the subscription.

  NO : If the display indicates a satellite antenna fault, go to **Pinpoint Test I**.

  Otherwise, go to H2.

H2 CHECK FOR NON-NETWORK DTCs

- Carry out the SDARS module self-test using the scan tool.
- **Are any non-network DTCs present?**

  YES : For DTC B1031 or DTC B1032, go to **Pinpoint Test I**.

  For all other DTCs, REFER to **DTC Charts**.

  NO : Go to H3.

H3 CHECK FOR COMMUNICATION WITH THE ACM AND APIM

- Carry out the network test using the scan tool.
- **Does the scan tool communicate with the ACM and the APIM (if equipped)?**

  YES : Go to H4.

  NO : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose no communication with the ACM or APIM.

H4 CHECK FOR LOST COMMUNICATION DTCs

- Key in ON position.
- Using the scan tool, clear any ACM and SDARS module continuous DTCs.
- Key in OFF position.
- Key in ON position.
- Wait at least 10 seconds.
- Retrieve the ACM and SDARS module continuous DTCs.
- **Is DTC U0184 (SDARS module), U0193 (ACM), or U0197 (SDARS module, if equipped with the SYNC system) present?**

  YES : For DTC U0184, go to H13.

  For DTC U0193, go to H11.

  For DTC U0197, go to H12.

  NO : Go to H5.

H5 CHECK THE SATELLITE AUDIO OUTPUT

- Enter the following diagnostic mode on the diagnostic tool: Electrical -> Audio -> Tones Test -> Satellite Digital Audio Receiver System
- Carry out the SDARS module tones test using the scan tool.

- **Are alternating LH/RH tones audible?**

  YES : Go to H11.

  NO : If the vehicle is equipped with the SYNC system, go to H6.

  Otherwise, go to H9.

H6 CHECK THE OPERATION OF THE SYNC SYSTEM AUDIO

- Operate the audio system in radio tuner (AM/FM) mode.
- Connect: Known Good MP3 Device (To Audio Input Jack)
- Using the ACM buttons, press AUX until "SYNC LINE IN" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "LINE IN" appears (navigation).
- Using the known good MP3 device, attempt to play a file through the audio input jack.
- **Does the SYNC system audio operate correctly?**

  YES : Go to H7.

  NO : Go to **Pinpoint Test U**.

H7 CHECK THE AUDIO CIRCUITS TO THE APIM FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: APIM C3338
- Disconnect: SDARS Module C4300
- Key in ON position.
- Measure the voltage between the SDARS module, harness side and ground as follows:

Connector-Pin	Circuit
C4300-5	VME52 (BU)
C4300-6	VME53 (VT/GN)
C4300-11	RME52 (GY/OG)
C4300-12	RME53 (BN/WH)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to H8.

H8 CHECK THE AUDIO CIRCUITS TO THE APIM FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the APIM, harness side and the SDARS module, harness side; and between the APIM, harness side and ground as follows:

APIM Connector-Pin	SDARS Module Connector-Pin	Circuit
C3338-10	C4300-5	VME52 (BN)
C3338-7	C4300-6	VME53 (VT/GN)
C3338-11	C4300-11	RME52 (GY/OG)
C3338-8	C4300-12	RME53 (BN/WH)

- **Is the resistance less than 5 ohms between the APIM and the SDARS module, and greater than 10,000 ohms between the APIM and ground?**

  YES : Go to H11.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

H9 CHECK THE AUDIO CIRCUITS TO THE ACM FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C240c or C290c
- Disconnect: SDARS Module C4300
- Key in ON position.
- Measure the voltage between the SDARS module, harness side and ground as follows:

Connector-Pin	Circuit
C4300-5	VME41 (GN/OG)
C4300-6	VME42 (VT/BN)
C4300-11	RME41 (BU/BN)
C4300-12	RME42 (YE/BU)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to H10.

H10 CHECK THE AUDIO CIRCUITS FROM THE SDARS MODULE FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the SDARS module, harness side and the ACM, harness side; and

between the SDARS module, harness side and ground as follows:

SDARS Module Connector-Pin	ACM Connector-Pin	Circuit
C4300-5	C240c-1 or C290c-1	VME41 (GN/OG)
C4300-6	C240c-9 or C290c-9	VME42 (VT/BN)
C4300-11	C240c-2 or C290c-2	RME41 (BU/BN)
C4300-12	C240c-10 or C290c-10	RME42 (YE/BU)

- **Is the resistance less than 5 ohms between the SDARS module and the ACM, and greater than 10,000 ohms between the SDARS module and ground?**

  YES : Go to H11.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

H11 ISOLATE THE SDARS MODULE

- Key in OFF position.
- Connect: APIM C3338 (If Equipped)
- Install a new SDARS module. Refer to **Satellite Digital Audio Receiver System (SDARS) Module**.
- Operate the audio system in satellite radio mode.
- **Does the system operate correctly?**

  YES : The concern was caused by an inoperative SDARS module. The system is operating correctly at this time.

  NO : If equipped with the SYNC system, go to H12.

  Otherwise, go to H13.

H12 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.

- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation. If the concern is still present, go to H13.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

H13 CHECK FOR CORRECT ACM OPERATION

- Key in OFF position.
- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: Poor Reception/No Sound - Satellite Audio

Normal Operation

Digital signals are received by the satellite antenna and sent to the satellite digital audio receiver system (SDARS) module, which then converts the signals and provides audio signals to the audio control module (ACM).

A short to ground typically has no effect on the antenna signal. However, an open in the antenna circuit will result in no sound from the satellite radio system. A short to voltage in the antenna circuit can have varying effects on the system.

- DTC B1031 (SDARS Satellite Antenna Open) - sets when an open or high resistance is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand.
- DTC B1032 (SDARS Satellite Antenna Short) - sets when a short to ground is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand.

This pinpoint test is intended to diagnose the following:

- Obstructions to the line of sight
- Satellite antenna cable
- Satellite antenna

- SDARS module

PINPOINT TEST I: POOR RECEPTION/NO SOUND - SATELLITE AUDIO

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

I1 CHECK THE OPERATION OF THE SATELLITE AUDIO

- Drive the vehicle to an open location, free of obstacles.
- Operate the audio system in satellite audio mode.
- **Is the reception OK?**

  YES : The system is OK at this time. ADVISE the customer that the satellite signal can be affected by obstructions to the satellite antenna line of sight.

  NO : Go to I2.

I2 CHECK FOR A SATELLITE ANTENNA FAULT MESSAGE

- Operate the audio system in satellite audio mode and observe the ACM display.
- **Does the ACM display indicate a satellite radio antenna fault?**

  YES : Go to I3.

  NO : Go to **Pinpoint Test H**.

I3 CHECK THE SATELLITE ANTENNA CABLE

- Key in OFF position.
- Disconnect: Satellite Antenna Connection (At Satellite Radio Receiver)
- Disconnect: Satellite Antenna Connection (At Satellite Radio Antenna)
- Measure the resistance of the satellite radio antenna cable between the SDARS module and the satellite antenna connection.
- **Is the resistance less than 1 ohm?**

  YES : Go to I4.

  NO : INSTALL a new satellite antenna cable. CLEAR the DTCs. REPEAT the self-test.

I4 SUBSTITUTE THE SATELLITE ANTENNA

- Install a known good satellite antenna.
- Operate the audio system in satellite audio mode.
- **Is the reception OK?**

  YES : INSTALL a new satellite antenna. REFER to **Antenna**. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to I5.

I5 CHECK FOR CORRECT SDARS MODULE OPERATION

- Key in OFF position.
- Disconnect the SDARS module connector.
- Check for:

  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the SDARS module connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SDARS module. REFER to **Satellite Digital Audio Receiver System (SDARS) Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Audio Input Jack Is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation - Vehicles Without the SYNC System

Audio signals are sent from the audio input jack to the audio control module (ACM). There are no external power or ground circuits to the audio input jack.

Vehicles With the SYNC System

Audio signals are sent from the audio input jack to the accessory protocol interface module (APIM). The signals are then sent to the ACM. There are no external power or ground circuits to the audio input jack.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Audio input jack
- ACM
- APIM (if equipped)

PINPOINT TEST J: THE AUDIO INPUT JACK IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Before carrying out this pinpoint test, make sure the MP3 device is operating correctly.**

J1 CHECK THE AUDIO INPUT JACK AUDIO

- Connect: Known Good MP3 Device (to Audio Input Jack)

- Using the known good MP3 device, attempt to play a file using the audio input jack.
- **Does the file play correctly?**

  YES : The system is operating correctly at this time. The concern may be with the customer device.

  NO : Go to J2.

J2 DETERMINE THE VEHICLE CONTENT

- Disconnect: Known Good MP3 Device (From Audio Input Jack)
- Determine if the vehicle is equipped with the SYNC system.
- **Is the vehicle equipped with the SYNC system?**

  YES : Go to J3.

  NO : Go to J4.

J3 CHECK THE APIM AUDIO OUTPUT

- Attempt to play an audio file using either the universal serial bus (USB) port or a Bluetooth® device.
- **Is the audio output OK for devices connected through the USB port or Bluetooth®?**

  YES : Go to J4.

  NO : Go to **Pinpoint Test P**.

J4 CHECK THE AUDIO INPUT JACK CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Audio Input Jack C3337
- Disconnect: ACM C290c or C240c, or APIM C3338 (If Equipped)
- Key in ON position.
- Measure the voltage between the audio input jack, harness side and ground as follows:

Connector-Pin	Circuit
C3337-1	VME46 (BU/GN)
C3337-2	RME46 (WH/GN)
C3337-3	RME45 (YE/GN)
C3337-4	VME45 (BU)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to J5.

J5 CHECK THE AUDIO INPUT JACK CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- For vehicles without the SYNC system, measure the resistance between the audio input jack,

harness side and the ACM, harness side; and between the audio input jack, harness side and ground as follows:

Audio Input Jack Connector-Pin	ACM Connector-Pin	Circuit
C3337-1	C240c-6 or C290c-6	VME46 (BU/GN)
C3337-2	C240c-14 or C290c-14	RME46 (WH/GN)
C3337-3	C240c-8 or C290c-8	RME45 (YE/GN)
C3337-4	C240c-7 or C290c-7	VME45 (BU)

- For vehicles with the SYNC system, measure the resistance between the audio input jack, harness side and the APIM, harness side; and between the audio input jack, harness side and ground as follows:

Audio Input Jack Connector-Pin	APIM Connector-Pin	Circuit
C3337-1	C3338-47	VME46 (BU/GN)
C3337-2	C3338-48	RME46 (WH/GN)
C3337-3	C3338-46	RME45 (YE/GN)
C3337-4	C3338-45	VME45 (BU)

- **Is the resistance less than 5 ohms between the audio input jack and the ACM (or APIM), and greater than 10,000 ohms between the audio input jack and ground?**

  YES : Go to J6.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

J6 SUBSTITUTE THE AUDIO INPUT JACK

- Connect: ACM C290c or C240c, or APIM C3338 (If equipped)
- Install a known good audio input jack.
- Operate the audio system using a device plugged into the audio input jack.
- **Does the system operate correctly?**

  YES : INSTALL a new audio input jack. REFER to **Audio Input Jack**. TEST the system for

normal operation.

NO : INSTALL the original audio input jack. Go to J7.

J7 CHECK FOR CORRECT ACM OPERATION

- Key in OFF position.
- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: No Global Positioning System (GPS) Antenna Signal

Normal Operation

The global position system (GPS) antenna provides information from the GPS satellite system to the GPS receiver in the navigation module. This information is used to calculate vehicle position and direction of travel.

- DTC 2204 (GPS Antenna Connection Open or Short) - sets when an open, short to ground, or short to voltage is detected in the GPS antenna circuit.

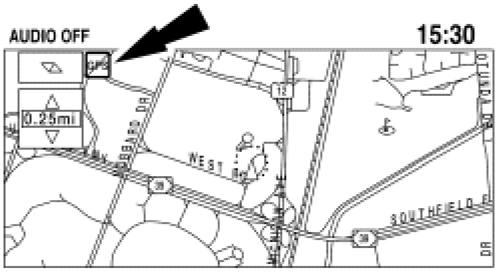
This pinpoint test is intended to diagnose the following:

- GPS antenna
- Audio control module (ACM)

PINPOINT TEST K: NO GLOBAL POSITIONING SYSTEM (GPS) ANTENNA SIGNAL

K1 CHECK THE OPERATION OF THE NAVIGATION SYSTEM

- Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.



N0026638

Fig. 18: Checking Operation Of Navigation System
Courtesy of FORD MOTOR CO.

- Operate the audio system in navigation mode.
- **Does the GPS icon appear, then disappear?**

  YES : The system is operating correctly at this time. NOTIFY the customer that obstructions to the line of sight may affect the GPS antenna.

  NO : Go to K2.

K2 CHECK THE ACM RECORDED DTCs

- Check the recorded DTCs from the ACM self-test.
- **Is DTC B2204 recorded?**

  YES : Go to K4 .

  NO : Go to K3.

K3 CHECK THE GPS ANTENNA MOUNTING

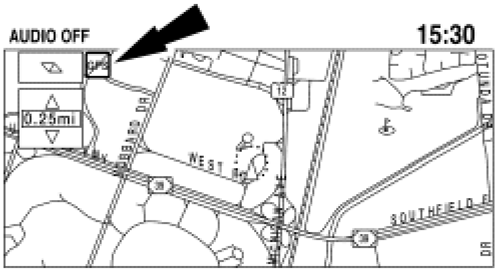
- Verify the GPS antenna is installed correctly and no aftermarket equipment is obstructing the antenna.
- **Is the GPS antenna mounted correctly?**

  YES : Go to K4.

  NO : Correctly INSTALL the GPS antenna. REFER to **Global Positioning System (GPS) Antenna**. TEST the system for normal operation.

K4 SUBSTITUTE THE GPS ANTENNA

- Install a good known GPS antenna.
- Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.



N0026638

Fig. 19: Checking Operation Of Navigation System
Courtesy of FORD MOTOR CO.

- Operate the audio system in navigation mode.
- **Does the GPS icon appear, then disappear?**

  YES : INSTALL a new GPS antenna. REFER to **Global Positioning System (GPS) Antenna**. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL the original GPS antenna. Go to K5 .

K5 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: The Audible Switch Feedback Is Inoperative

Normal Operation

The audible switch feedback settings are controlled by the audio control module (ACM). The audible switch feedback can be set to ALL, TOUCH SCREEN, or NONE depending on user preference.

This pinpoint test is intended to diagnose the following:

- Audible switch feedback setting
- Audio control module (ACM)

PINPOINT TEST L: THE AUDIBLE SWITCH FEEDBACK IS INOPERATIVE

L1 CHECK THE SWITCH DISPLAY

- Key in ON position.
- Turn the audio system on.
- Press the MENU button.

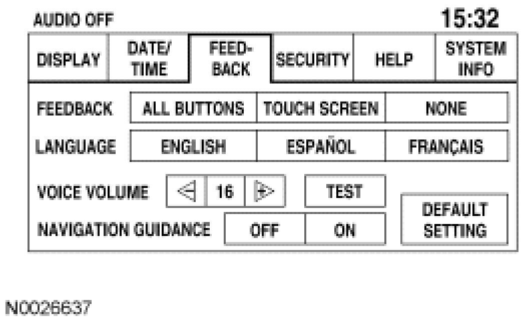


Fig. 20: Checking Switch Display
Courtesy of FORD MOTOR CO.

- Select the FEEDBACK tab.
- **Is NONE highlighted on the audible feedback settings?**

  YES : SELECT "ALL BUTTONS". TEST the system for normal operation.

  NO : Go to L2.

L2 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test M: The Voice Guidance Is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

For the Audiophile navigation system, the audio control module (ACM) provides voice-assisted route guidance through the front speakers.

For the THX® navigation system, the ACM sends voice guidance audio signals to the audio digital signal processing (DSP) module through circuits RMN07 (VT) and VMN07 (GY). The voice-assisted route guidance is broadcast through the instrument panel speaker.

For all navigation audio systems, the volume of the voice guidance is controlled by the ACM.

This pinpoint test is intended to diagnose the following:

- Incorrect system setting
- Wiring, terminals or connectors (THX® only)
- DSP module (if equipped)
- ACM

PINPOINT TEST M: THE VOICE GUIDANCE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

M1 CHECK THE VOICE GUIDANCE SETTING

- Operate the audio system in navigation mode.
- Press the MENU button.

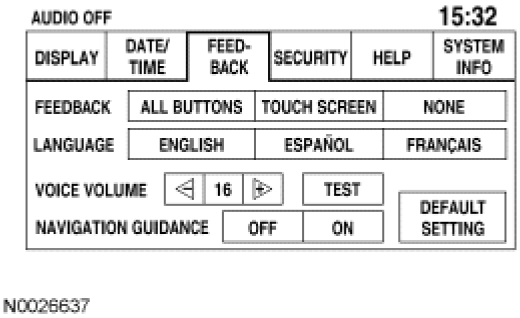

Fig. 21: Checking Voice Guidance Setting
Courtesy of FORD MOTOR CO.

- Select the FEEDBACK tab.
- Select DEFAULT SETTING.
- Verify the operation of the voice guidance.
- **Does the voice guidance operate correctly?**

  YES : The system is operating correctly at this time. The concern was caused by a customer-

selected setting.

NO : If the vehicle is equipped with THX® audio, go to M2.

Otherwise, go to M6.

M2 CHECK THE INSTRUMENT PANEL SPEAKER

- Carry out the speaker walk-around test.
- **Does the instrument panel speaker operate correctly?**

  YES : Go to M3.

  NO : Go to **Pinpoint Test C**.

M3 CHECK THE NAVIGATION AUDIO SIGNAL TO THE DSP MODULE

- Key in OFF position.
- Disconnect: DSP Module 4326c
- Operate the audio system in navigation mode.

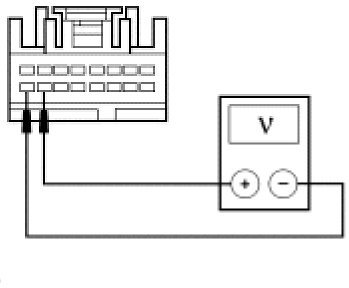

Fig. 22: Checking Navigation Audio Signal To DSP Module
Courtesy of FORD MOTOR CO.

- While pressing the REPEAT button on the ACM, measure the AC voltage between the DSP module 4326c-15, circuit VMN07 (GY), harness side and the DSP module 4326c-16, circuit RMN07 (VT), harness side.
- **Is a fluctuating AC voltage present?**

  YES : Go to M7.

  NO : Go to M4.

M4 CHECK CIRCUITS RMN07 (VT) AND VMN07 (GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C240d
- Key in ON position.

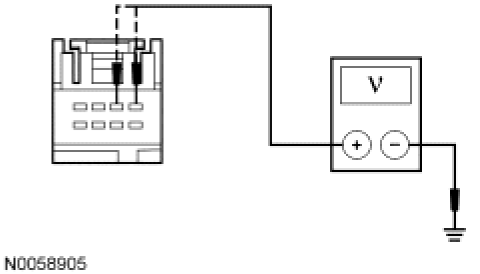

Fig. 23: Checking Circuits RMN07 (VT) & VMN07 (GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ACM C240d-1, circuit VMN07 (GY), harness side and ground; and between the ACM C240d-2, circuit RMN07 (VT), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to M5.

M5 CHECK CIRCUITS RMN07 (VT) AND VMN07 (GY) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the ACM, harness side and the DSP module, harness side; and between the ACM, harness side and ground as follows:

ACM Connector-Pin	DSP Module Connector-Pin	Circuit
C240d-1	4326c-15	VMN07 (GY)
C240d-2	4326c-16	RMN07 (VT)

- **Is the resistance less than 5 ohms between the ACM and the DSP module, and greater than 10,000 ohms between the ACM and ground?**

  YES : Go to M6.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

M6 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation after the repair.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

M7 CHECK FOR CORRECT DSP MODULE OPERATION

- Disconnect all the DSP module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DSP module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSP module. REFER to **Audio Digital Signal Processing (DSP) Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Audio Does Not Reduce When The Parking Aid Tone Sounds

Normal Operation

The parking aid module (PAM) sends the volume cutback message to the audio control module (ACM) via the medium speed controller area network (MS-CAN). When the PAM sounds the parking aid tone, it sends an "Enabled" message to the ACM. When the ACM receives this message, it reduces the speaker output so that the parking aid tone can be heard more clearly.

- DTC U0159 (Lost Communication With Parking Assist Control Module [PAM]) - sets when the volume cutback message is missing for greater than 5 seconds. When the message is missing, the ACM defaults to no volume cutback when the parking aid tone is sounding.

This pinpoint test is intended to diagnose the following:

- Parking aid system concern
- ACM

PINPOINT TEST N: THE AUDIO DOES NOT REDUCE WHEN THE PARKING AID TONE SOUNDS

N1 CHECK THE PARKING AID SIGNAL

- Apply the parking brake.

- Place an object behind the vehicle within the range of the parking aid sensors. Refer to **PARKING AID** article.
- Key in ON position.
- Place the transmission in REVERSE (R).
- Enter the following diagnostic mode on the diagnostic tool: ACM DataLogger
- Monitor the RPA_STAT (Parking Aid Input Status) PID while the parking aid tone is sounding.
- **Does the RPA_STAT PID read "Enabled" while the parking aid tone is sounding?**

  YES : Go to N2.

  NO : REFER to **PARKING AID** article to continue diagnosis of the parking aid system.

N2 CHECK FOR COMMUNICATION WITH THE PAM

- Carry out the network test using the scan tool.
- **Does the scan tool communicate with the PAM?**

  YES : Go to N3.

  NO : REFER to **MODULE COMMUNICATIONS NETWORK** article.

N3 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Position Cursor Is Inaccurate

Normal Operation

The primary source of vehicle location for the navigation system is the audio control module (ACM) receiving the position signal through the global positioning system (GPS) antenna.

In addition, the ACM receives the wheel pulse signal from the instrument cluster (IC) (which gateways the signal from the ABS module). This secondary signal is used to calculate vehicle position when the GPS signal is lost. It also supports the adaptive learning function of the ACM, whereby the ACM can compensate for long-term differences between the GPS signal location, and the actual distance traveled by the vehicle.

- DTC B2204 (GPS Antenna Connection Open or Short) - sets when an open, short to ground, or short to voltage is detected in the GPS antenna circuit. If DTC B2204 is present, go to **Pinpoint Test K**.

- DTC U0155 (Lost Communication With Instrument Panel Cluster [IC] Control Module) - sets when the ACM is missing messages from the IC for greater than 5 seconds.
- DTC U2473 (Unexpected Vehicle Speed [VSS]) - sets when the calculated vehicle distance traveled based on the wheel pulse signal does not agree with the GPS antenna location. To do this, the ACM compares the wheel pulse signal during a 4-second range, and compares it with the change in GPS antenna location. If the ACM finds that the variation is greater than 0.5% after performing this check 4 times, it sets DTC U2473. When DTC U2473 is set, the adaptive learn function is disabled. This DTC is also set when the navigation rolling wheel count signal is missing for greater than 2 seconds with the key in RUN.

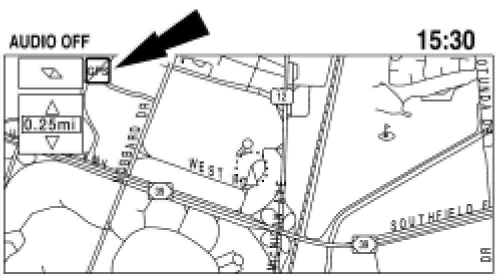
This pinpoint test is intended to diagnose the following:

- GPS antenna
- VSS signal concern
- ACM

PINPOINT TEST O: THE POSITION CURSOR IS INACCURATE

O1 CHECK THE OPERATION OF THE NAVIGATION SYSTEM

- Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.



N0026638

Fig. 24: Checking Operation Of Navigation System
Courtesy of FORD MOTOR CO.

- Operate the audio system in navigation mode.
- **Does the GPS icon appear, then disappear?**

YES : Go to O2.

NO : Go to **Pinpoint Test K**.

O2 CHECK THE ACM DTCs

- Review the DTCs from the ACM self-test.
- **Is DTC U2473 or U0155 present?**

YES : Go to O3.

NO : Go to **Pinpoint Test K**.

O3 CHECK FOR COMMUNICATION WITH THE IC

- Carry out the network test using the scan tool.
- **Does the scan tool communicate with the IC?**

  YES : Go to O4.

  NO : REFER to **MODULE COMMUNICATIONS NETWORK** article.

O4 CHECK THE IC AND ABS MODULE DTCs

- Carry out the self-test for the IC and the ABS module.
- **Are any DTCs recorded?**

  YES : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article (IC) or **VEHICLE DYNAMIC SYSTEMS** article (ABS module) to diagnose a fault in the wheel pulse signal.

  NO : Go to O5.

O5 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test P: Voice Recognition Is Inoperative/Does Not Operate Correctly - Vehicles Without SYNC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

When the VOICE switch is pressed, a signal is sent to the audio control module (ACM) through circuit VME54 (BU/OG), and the ACM enters voice recognition mode. A microphone located in the interior rear view mirror receives the voice command and sends a signal to the ACM through circuits VMM13 (YE/GN) and RMM13 (BU). Power to the interior rear view mirror is provided through circuit CBP02 (GN), and ground through circuit GD139 (BK/YE).

The microphone test is available through the integrated diagnostic system (IDS). Running this test causes the ACM to produce a test tone. If the system is operating correctly, the microphone detects the tone and produces a

signal to the ACM indicating the tone was heard.

- DTC B2633 (Driver-Front Microphone Circuit Failure) - set by the ACM during the microphone test when the ACM does not receive an adequate signal from the microphone when the test tone is sounded.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Steering wheel controls
- Microphone (part of the interior rear view mirror)
- ACM

PINPOINT TEST P: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - VEHICLES WITHOUT SYNC

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

P1 CHECK THE ACM DTCs

- Carry out the microphone test using the scan tool.
- **Is DTC B2633 retrieved?**

  YES : Go to P9.

  NO : Go to P2.

P2 CHECK THE OPERATION OF THE STEERING WHEEL CONTROL SWITCHES

- Operate the audio system in radio tuner (AM/FM) mode.
- Press the VOL+ and VOL- steering wheel control switches.
- **Do the VOL+ and VOL- steering wheel control switches operate correctly?**

  YES : Go to P3.

  NO : Go to **Pinpoint Test G**.

P3 CHECK THE VOICE SWITCH PID (VOICE_SW)

- Disconnect: ACM DataLogger
- Monitor the ACM PID (VOICE_SW) while pressing and releasing the VOICE switch on the steering wheel controls.
- **Does the PID indicate the correct VOICE switch state?**

  YES : Go to P9.

  NO : Go to P4.

P4 CHECK THE VOICE SWITCH

- Key in OFF position.
- Disconnect: Steering Wheel Controls C2999
- Measure the resistance between the steering wheel controls pins component side while pressing and

releasing the VOICE switch as follows:

Steering Wheel Controls Connector-Pin	Steering Wheel Controls Connector-Pin	VOICE Switch Position	Resistance Value (Ohms)
C2999-6	C2999-4	Pressed Released	50.6-51.6 179.3-182.9

- **Are all the resistance values within specification?**

  YES : Go to P5.

  NO : INSTALL new steering wheel controls. REFER to **Steering Wheel Controls**. TEST the system for normal operation.

P5 CHECK CIRCUIT VME45 (BU/OG) FOR A SHORT TO VOLTAGE

- Disconnect: ACM C240a or C290a
- Key in ON position.

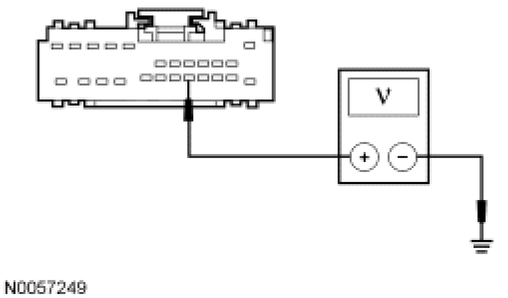


Fig. 25: Checking Circuit VME45 (BU/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ACM C240a-17 or C290a-17, circuit VME45 (BU/OG), harness side and ground.
- **Is any voltage present?**

  YES : Go to P6.

  NO : Go to P7.

P6 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Clockspring C218a
- Key in ON position.

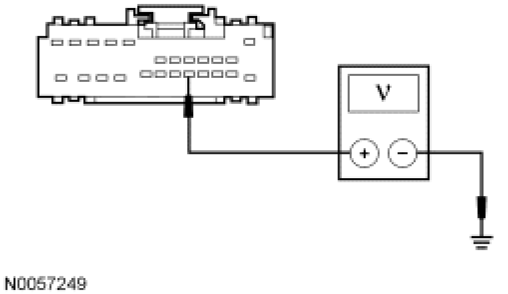

Fig. 26: Checking Clockspring For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ACM C240a-17 or C290a-17, circuit VME45 (BU/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

P7 CHECK CIRCUIT VME54 (BU/OG) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the ACM, harness side and the steering wheel controls, harness side; and between the ACM, harness side and ground as follows.

ACM Connector-Pin	Steering Wheel Controls Connector-Pin	Circuit
C240a or C290a-17	C2999-6	VME54 (BU/OG)

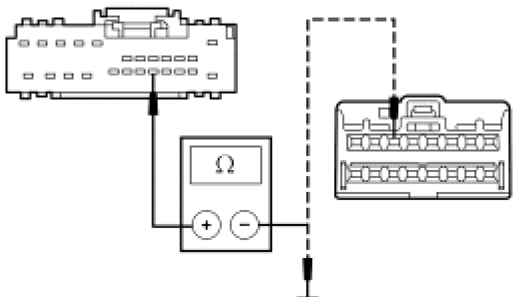
- **Is the resistance less than 5 ohms between the ACM and the steering wheel controls, and greater than 10,000 ohms between the ACM and ground?**

  YES : Go to P14.

  NO : Go to P8.

P8 CHECK THE CLOCKSPRING FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Clockspring C218a



N0057330

Fig. 27: Checking Clockspring For An Open Or Short To Ground
Courtesy of FORD MOTOR CO.

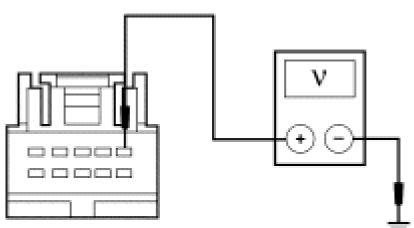
- Measure the resistance between the ACM C240a-17 or C290a-17, circuit VME54 (BU/OG), harness side and the clockspring C218a-6, circuit VME54 (BU/OG), harness side; and between the ACM C240a-17 or C290a-17, circuit VME54 (BU/OG), harness side and ground.
- **Is the resistance less than 5 ohms between the ACM and the clockspring, and greater than 10,000 ohms between the ACM and ground?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

P9 CHECK CIRCUIT CBP02 (GN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Interior Rear View Mirror C9030
- Key in ON position.



N0057331

Fig. 28: Checking Circuit CBP02 (GN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the interior rear view mirror C9030-1, circuit CBP02 (GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to P10.

  NO : VERIFY the smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

P10 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.

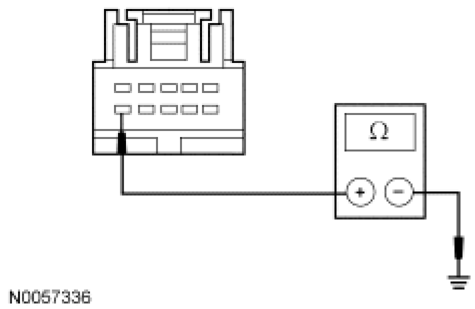


Fig. 29: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the interior rear view mirror C9030-10, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to P11.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

P11 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: ACM C240c
- Key in ON position.

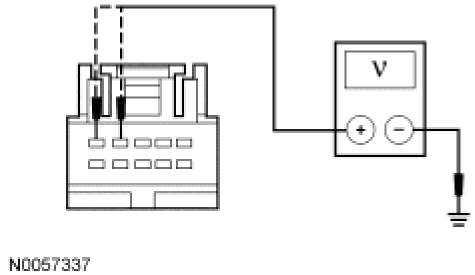

Fig. 30: Checking Microphone Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the interior rear view mirror C9030-4, circuit VMM13 (YE/GN), harness side and ground; and between the interior rear view mirror C9030-5, circuit RMM13 (BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to P12.

P12 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the inside rear view mirror, harness side and the ACM, harness side; and between the rear view mirror, harness side and ground as follows:

Interior Rear View Mirror Connector-Pin	ACM Connector-Pin	Circuit
C9030-4	C240c-11 or C290c-11	VMM13 (YE/GN)
C9030-5	C240c-12 or C290c-12	RMM13 (BU)

- **Is the resistance less than 5 ohms between the interior rear view mirror and the ACM, and greater than 10,000 ohms between the interior rear view mirror and ground?**

  YES : Go to P13.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

P13 ISOLATE THE INTERIOR REAR VIEW MIRROR

- Connect: ACM C240c or C290c
- Substitute a known good interior rear view mirror.
- Operate the audio system in navigation mode.
- Attempt several voice commands. Refer to the Owner's Literature.
- **Does the voice recognition operate correctly?**

  YES : INSTALL a new interior rear view mirror. REFER to **REAR VIEW MIRRORS** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to P14.

P14 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose

or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Q: The Speed Sensitive Volume Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio/Navigation for schematic and connector information.

Normal Operation

The speed sensitive volume function adjusts the volume based on the vehicle speed sensor (VSS) signal from the instrument cluster (IC). The IC does not generate the VSS signal; it gateways the signal from the PCM.

- DTC U0155 (Lost Communication With Instrument Panel Cluster Control [IC] Module) - sets when the VSS signal is lost for greater than 5 seconds. When the signal is lost, the audio control module (ACM) turns the speed sensitive volume feature off. The smart junction box (SJB) also receives this signal, and should demonstrate symptoms if the VSS signal is lost. If no symptoms are present, this DTC can be ignored, as it may have been set by a low battery voltage condition.

This pinpoint test is intended to diagnose the following:

- Speed sensitive volume setting
- VSS signal concern
- ACM

PINPOINT TEST Q: THE SPEED SENSITIVE VOLUME DOES NOT OPERATE CORRECTLY

Q1 CHECK THE SPEEDOMETER OPERATION

- Drive the vehicle and observe the speedometer.
- **Does the speedometer operate correctly?**

  YES : Go to Q2.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

Q2 CHECK THE SPEED SENSITIVE VOLUME SETTING

- Turn the speed sensitive volume off. Refer to the Owner's Literature.
- Operate the audio system in radio tuner (AM/FM) mode.
- Drive the vehicle at various speeds and observe the speaker volume.
- Set the speed sensitive volume to maximum compensation. Refer to the Owner's Literature.
- Operate the audio system in radio tuner (AM/FM) mode.
- Drive the vehicle at various speeds and observe the speaker volume.
- **Does the volume remain constant with the speed sensitive volume turned off, and increase and decrease with vehicle speed with the speed sensitive volume set to maximum?**

  YES : The system is operating correctly at this time. INFORM the customer of proper operation.

  NO : Go to Q3.

Q3 CHECK FOR DTC U0155

- Key in OFF position.
- Clear any ACM DTCs.
- Key in ON position.
- Wait 10 seconds, and re-run the ACM self-test.
- Run the SJB self-test.
- **Is DTC U0155 present in both the ACM and the SJB?**

  YES : Go to Q5.

  NO : Go to Q4.

Q4 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Q5 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect IC connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. CLEAR the ACM DTCs. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test R: The SYNC System Is Completely Inoperative

Normal Operation

The accessory protocol interface module (APIM) receives voltage at all times from circuit SBB13 (GY/RD), and ground through circuit GD148 (BK/YE). The wake-up signal is sent to the APIM by the audio control module (ACM) via the medium speed controller area network (MS-CAN).

- DTC U0184 (Lost Communication With Radio [ACM]) - set by the APIM when it is missing messages from the ACM over the MS-CAN for greater than 5 seconds.
- DTC U0197 (Lost Communication With Telephone Control Module) - set by the ACM when it is missing messages from the APIM over the MS-CAN for greater than 5 seconds.

This pinpoint test is intended to diagnose the following:

- Audio system concern
- Communication network concern
- Customer error
- Customer device
- APIM
- ACM

PINPOINT TEST R: THE SYNC SYSTEM IS COMPLETELY INOPERATIVE

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

R1 CHECK THE AUDIO SYSTEM OPERATION

- Press the AUX button repeatedly until "SYNC LINE IN" appears on the display (except navigation), or look for the presence of the "USER DEVICE" tab (navigation).
- **Is "SYNC LINE IN" available when pressing the AUX button (except navigation), or is the "USER DEVICE" tab present (navigation)?**

  YES : Go to R2.

  NO : Go to R3.

R2 CHECK THE SYNC SYSTEM OPERATION

NOTE: **Carrying out a Master Reset will return all preference settings to the factory defaults, erase all the phone book and call histories and delete any devices paired with the SYNC system.**

- Connect: Known Good MP3 Device (To Audio Input Jack)

NOTE: **Make sure no universal serial bus (USB) device is plugged-in, and no Bluetooth® device is active for this step.**

- Using the ACM buttons, press AUX until "SYNC LINE IN" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "LINE IN" appears (navigation).

- Using the known good MP3 device, attempt to play a file using the audio input jack.
- Disconnect: Known Good MP3 Device (From Audio Input Jack)
- Connect: Known Good USB Device (To USB Port)
- Using the ACM buttons, press AUX until "SYNC USB" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "USB" appears (navigation).

NOTE: If a USB mass storage device is used to play the audio file, the SYNC system will only play audio files that do not have digital rights management (DRM) protection.

- Using a known good MP3 device or mass storage device, attempt to play a file using the USB port.
- Disconnect: Known Good USB Device (From USB Port)
- Using a known good Bluetooth® device, attempt to pair to the APIM using Bluetooth®, and attempt to play an audio file using the Bluetooth® connection. Refer to the Owner's Literature.
- **Do all of the SYNC inputs function correctly?**

  YES : The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset.

  For vehicles without navigation, PRESS the "PHONE" button on the steering wheel controls, SCROLL until "SYSTEM SETTINGS" displays on the screen, PRESS "OK", SCROLL until "ADVANCED" displays on the screen, PRESS "OK", SCROLL until "MASTER RESET" displays on the screen, and PRESS "OK" twice.

  For vehicles with navigation, PRESS "PHONE" on the ACM display, SELECT the "SETTINGS" tab, PRESS "ADVANCED", SELECT "Master Reset", and PRESS "YES".

  REVIEW the pairing process with the customer. If the customer device still does not pair, the fault is with the customer device.

  NO : If only some of the inputs are inoperative, go to **Symptom Chart - SYNC System** to diagnose the observed symptom.

  If all inputs are inoperative, go to **Pinpoint Test U**.

R3 CHECK FOR SCAN TOOL COMMUNICATION

- Carry out the network test using the scan tool.
- **Does the APIM pass the network test?**

  YES : Go to R4.

  NO : REFER to **MODULE COMMUNICATIONS NETWORK** article.

R4 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.

- Check for:
    - corrosion
    - damaged pins
    - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test S: Unable To Pair Bluetooth® Device

Normal Operation

When a new Bluetooth® device is added, the accessory protocol interface module (APIM) and the Bluetooth® device must be paired together. Most Bluetooth® devices will pair with the SYNC system, although functionality will vary. To determine if a Bluetooth® device is supported, retrieve the consumer interface processor (CIP) software level using the **Accessory Protocol Interface Module (APIM) Software Level Check** and verify the customer device is on the compatibility list for the current CIP software level.

Pairing a Bluetooth® device is accomplished through the "Add Device" selection of the phone menu. When pairing a device, the SYNC system generates a unique personal identification number (PIN) that must be entered on the Bluetooth® device in order for the pairing process to be successful. There are also some device-specific actions that must take place. For additional information on the pairing process, refer to the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Incompatible Bluetooth® device
- Customer error
- Customer Bluetooth® device
- APIM

PINPOINT TEST S: UNABLE TO PAIR BLUETOOTH® DEVICE

S1 CHECK THE BLUETOOTH® CONNECTION

NOTE:	**Carrying out a Master Reset will return all preference settings to the factory defaults, erase all the phone book and call histories and delete any devices paired with the SYNC system.**

NOTE: Refer to the for a list of compatible devices.

- Using a known good Bluetooth® device, attempt to pair to the SYNC system using Bluetooth®. Refer to the Owner's Literature.
- Enter the following diagnostic mode on the diagnostic tool: APIM DataLogger
- Monitor the BT_PAIR (Bluetooth® device paired) and BT_CONN (Bluetooth® device connected) PIDs.
- **Do the BT_PAIR and BT_CONN PIDs both read "Yes"?**

  YES : The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset.

  For vehicles without navigation, PRESS the "PHONE" button on the steering wheel controls, SCROLL until "SYSTEM SETTINGS" displays on the screen, PRESS "OK", SCROLL until "ADVANCED" displays on the screen, PRESS "OK", SCROLL until "MASTER RESET" displays on the screen, and PRESS "OK" twice.

  For vehicles with navigation, PRESS "PHONE" on the ACM display, SELECT the "SETTINGS" tab, PRESS "ADVANCED", SELECT "Master Reset", and PRESS "YES".

  REVIEW the pairing process with the customer. If the customer device still does not pair, the fault is with the customer device.

  NO : Go to S2.

S2 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test T: The Universal Serial Bus (USB) Port Is Inoperative/Does Not Operate Correctly

Normal Operation

The universal serial bus (USB) port is connected to the accessory protocol interface module (APIM) through the USB cable. The USB port can be used to play audio files or upload software from mass storage devices, or for connecting a media device.

If supported by the user device, the USB can provide charging. Because of this feature, when a USB device is plugged into the USB port, the SYNC system does not automatically switch to the device.

The USB cable and port are not serviceable separately.

- DTC U261C (USB #1 Device Error) - sets when the APIM detect an over-current or over-temperature condition in the USB circuit. This can be caused by a fault in the USB cable or port, or by the customer USB device.

This pinpoint test is intended to diagnose the following:

- Customer USB device
- USB cable and port
- APIM

PINPOINT TEST T: THE UNIVERSAL SERIAL BUS (USB) PORT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

T1 CHECK THE USB CONNECTION

- Connect: Known Good USB Device (To USB Port)
- Using the ACM buttons, press AUX until "SYNC USB" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "USB" appears (navigation).

NOTE: If a USB mass storage device is used to play the audio file, SYNC will only play audio files that do not have digital rights management (DRM) protection.

- Using a known good MP3 or mass storage device, attempt to play an audio file using the USB port.
- **Does the known good device successfully play an audio file using the USB connection?**

  YES : The SYNC system is operating correctly. REVIEW the operation of the USB port with the customer. If the customer device still does not operate correctly, the fault is with the customer device.

  NO : Go to T2.

T2 INSPECT THE USB CABLE

- Key in OFF position.
- Disconnect: USB Cable (At APIM)
- Inspect the USB cable for damage.
- Connect: USB Cable (AT APIM)
- Key in ON position.
- Using the ACM buttons, press AUX until "SYNC USB" appears on the display (except navigation),

or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "USB" appears (navigation).

- Using a known good MP3 or mass storage device, attempt to play an audio file using the USB port.
- **Does the known good device successfully play the audio file using the USB connection?**

  YES : The concern was caused by the USB connection not being seated correctly. The system is now operating correctly.

  NO : Go to T3.

T3 ISOLATE THE USB CABLE AND PORT

- Disconnect: Known Good USB Device (From USB Port)
- Install a new USB cable and port. Refer to **Universal Serial Bus (USB) Cable and Port**.
- Connect: Known Good USB Device (To USB Port)
- Using the ACM buttons, press AUX until "SYNC USB" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "USB" appears (navigation).
- Using a known good MP3 or mass storage device, attempt to play an audio file using the USB port.
- **Does the known good device successfully play an audio file using the USB connection?**

  YES : The concern was caused by an inoperative USB cable. The system is now operating correctly.

  NO : Go to T4.

T4 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test U: Poor Quality/Distorted/No Sound While In SYNC Mode

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The accessory protocol interface module (APIM) sends left and right channel analog audio signals through circuits VME52 (BU), RME52 (GY/OG), VME53 (VT/GN), and RME53 (BN/WH). These audio signals are sent to the audio control module (ACM).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ACM
- APIM

PINPOINT TEST U: POOR QUALITY/DISTORTED/NO SOUND WHILE IN SYNC MODE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

U1 VERIFY THE OPERATION OF THE SYNC SYSTEM AUDIO SOURCES

- Connect: Known Good MP3 Device (To Audio Input Jack)

NOTE: Make sure no universal serial bus (USB) device is plugged-in, and no Bluetooth®device is active for this step.

- Using the ACM buttons, press AUX until "SYNC LINE IN" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "LINE IN" appears (navigation).
- Using the known good MP3 device, attempt to play an audio file using the audio input jack, and listen to the audio output.
- Disconnect: Known Good MP3 Device (From Audio Input Jack)
- Connect: Known Good USB Device (To USB Port)
- Using the ACM buttons, press AUX until "SYNC USB" appears on the display (except navigation), or press MEDIA, select "USER DEVICE", and press "SOURCE" repeatedly until "USB" appears (navigation).

NOTE: If a USB mass storage device is used to play the audio file, the SYNC system will only play audio files that do not have digital rights management (DRM) protection.

- Using a known good MP3 device or a mass storage device, attempt to play a file using the USB port, and listen to the audio output.
- Disconnect: Known Good USB Device (From USB Port)
- Using a known good Bluetooth® device, attempt to pair to the APIM using Bluetooth®, and attempt to play an audio file using the Bluetooth® connection while listening to the audio output. Refer to the Owner's Literature.

- **Is there poor quality/distorted sound from each SYNC audio source?**

  YES : Go to U2.

  NO : If the concern is only with some (but not all) of the audio sources, go to **Symptom Chart - SYNC System** to diagnose the observed symptom.

  If all audio sources operate correctly, the concern is with the customer device.

U2 CHECK THE CIRCUITS FROM THE APIM FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C290c or C240c
- Disconnect: APIM C3338
- Measure the voltage between the APIM, harness side and ground as follows:

Connector-Pin	Circuit
C3338-23	VME42 (VT/BN)
C3338-24	RME42 (YE/BU)
C3338-25	VME41 (GN/OG)
C3338-26	RME41 (BU/BN)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to U3.

U3 CHECK THE CIRCUITS FROM THE APIM FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the APIM, harness side, and the ACM, harness side; and between the APIM, harness side and ground as follows:

APIM Connector-Pin	ACM Connector-Pin	Circuit
C3338-23	C290c-9 or C240c-9	VME42 (VT/BN)
C3338-24	C290c-10 or C240c-10	RME42 (YE/BU)
C3338-25	C290c-1 or C240c-1	VME41 (GN/OG)
	C290c-2 or	RME41

C3338-26	C240c-2	(BU/BN)

- **Is the resistance less than 5 ohms between the APIM and the ACM, and greater than 10,000 ohms between the APIM and ground?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to U4.

U4 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation. If the concern is still present, go to U5.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

U5 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test V: Voice Recognition Is Inoperative/Does Not Operate Correctly - Vehicles With The SYNC System

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

When the VOICE switch is pressed, it changes the reference voltage on circuit VME54 (BU/OG), and the audio system enters voice recognition mode. If the vehicle is equipped with navigation, the VOICE switch is wired to the audio control module (ACM). If the vehicle is not equipped with navigation, the VOICE switch is wired to the accessory protocol interface module (APIM). A microphone located in the interior rear view mirror receives the voice command and sends a signal to the APIM through circuits VMM13 (YE/GN) and RMM13 (BU). The microphone is also used to detect outgoing audio during a phone call.

If the vehicle is equipped with navigation, the APIM receives the microphone input, and also broadcasts it to the ACM through circuits VMM13 (YE/GN) and RMM13 (BU). This is to allow voice commands specific to the navigation system to be handled directly by the ACM. The first voice commands spoken determine which system handles the voice commands.

- DTC B1038 (Microphone Input Circuit Failure) - set by the APIM during the on-demand self-test if the APIM does not detect the microphone.
- DTC B2633 (Driver-Front Microphone Circuit Failure) - set by the ACM during the microphone test when the ACM does not receive an adequate signal from the microphone when the test tone is sounded.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Steering wheel controls
- Microphone (part of the interior rear view mirror)
- ACM (if equipped with navigation)
- APIM

PINPOINT TEST V: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - VEHICLES WITH THE SYNC SYSTEM

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

V1 CHECK THE OPERATION OF THE STEERING WHEEL CONTROLS

- Operate the audio system in radio tuner (AM/FM) mode.
- Press the VOICE button on the steering wheel controls.
- **Does the audio system enter voice recognition mode?**

  YES : Go to V2.

  NO : Go to **Pinpoint Test G** to diagnose the steering wheel controls system.

V2 CHECK THE OPERATION OF THE VOICE RECOGNITION

- Press the VOICE button on the steering wheel controls.
- Wait for the SYNC system to acknowledge the VOICE button being pressed.
- While still in voice recognition mode, speak the command "PHONE", and observe the audio

system.

- **Does the SYNC system acknowledge the command "PHONE"?**

  YES : If the vehicle is equipped with navigation, go to V3.

  Otherwise, the system is operating correctly at this time. ADVISE the customer on the correct operation of the voice recognition system.

  NO : Go to V6.

V3 CHECK THE MICROPHONE SIGNAL TO THE ACM

- Key in OFF position.
- Disconnect: ACM C290c or C240c

NOTE: **ACM C290a (or C240a) must remain connected for this step to produce accurate results.**

- Operate the audio system in radio tuner (AM/FM) mode.
- Press the VOICE button on the steering wheel controls.

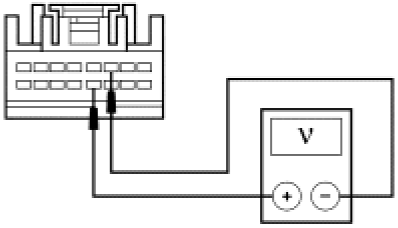

Fig. 31: Checking Microphone Signal To ACM
Courtesy of FORD MOTOR CO.

- While speaking a command, measure the AC voltage between the ACM C290c-11 or C240c-11, circuit VMM02 (YE/GN), harness side and the ACM C290c-12 or C240c-12, circuit RMM02 (BU/WH), harness side.
- **Is a fluctuating AC voltage present?**

  YES : Go to V12.

  NO : Go to V4.

V4 CHECK THE MICROPHONE CIRCUITS TO THE ACM FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: APIM C3338
- Key in ON position.

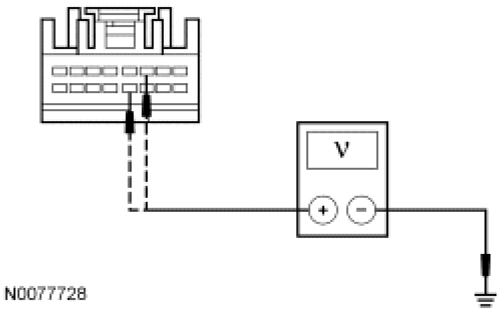

Fig. 32: Checking Microphone Circuits To ACM For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ACM C290c-11 or C240c-11, circuit VMM02 (YE/GN), harness side and ground; and between the ACM C290c-12 or C240c-12, circuit RMM02 (BU/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to V5.

V5 CHECK THE MICROPHONE CIRCUITS TO THE ACM FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the ACM, harness side and the APIM, harness side; and between the ACM, harness side and ground as follows:

ACM Connector-Pin	APIM Connector-Pin	Circuit
C290c-11 or C240c-11	C3338-12	VMM02 (YE/GN)
C290c-12 or C240c-12	C3338-13	RMM02 (BU/WH)

- **Is the resistance less than 5 ohms between the ACM and the APIM, and greater than 10,000 ohms between the ACM and ground?**

  YES : Go to V11.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

V6 CHECK CIRCUIT CBP02 (GN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Interior Rear View Mirror C9030
- Key in ON position.

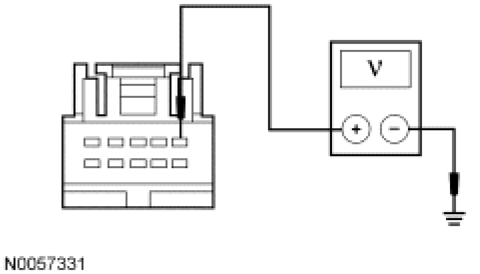

Fig. 33: Checking Circuit CBP02 (GN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the interior rear view mirror C9030-1, circuit CBP02 (GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to V7.

  NO : VERIFY the smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible sources of the circuit short.

V7 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.

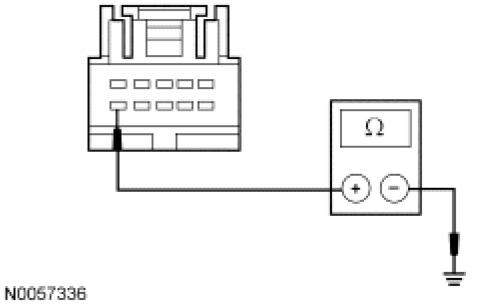

Fig. 34: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the interior rear view mirror C9030-10, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to V8.

  NO : REPAIR the circuit. TEST the system for normal operation.

V8 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: APIM C3338
- Key in ON position.

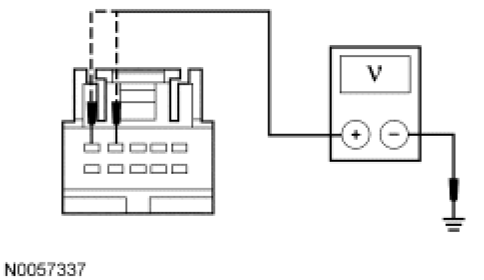

Fig. 35: Checking Microphone Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the interior rear view mirror C9030-4, circuit VMM13 (YE/GN), harness side and ground; and between the interior rear view mirror C9030-5, circuit RMM13 (BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to V9.

V9 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the inside rear view mirror, harness side and the APIM, harness side; and between the interior rear view mirror, harness side and ground as follows:

Interior Rear View Mirror Connector-Pin	APIM Connector-Pin	Circuit
C9030-4	C3338-5	VMM13 (YE/GN)
C9030-5	C3338-6	RMM13 (BU)

- **Is the resistance less than 5 ohms between the interior rear view mirror and the APIM, and greater than 10,000 ohms between the interior rear view mirror and ground?**

  YES : Go to V10.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

V10 ISOLATE THE INTERIOR REAR VIEW MIRROR

- Connect: APIM C3338
- Install a new interior rear view mirror. Refer to **REAR VIEW MIRRORS** article.
- Operate the audio system in radio tuner (AM/FM) mode.
- Press the VOICE button on the steering wheel controls, and attempt several voice commands.

- **Does the voice recognition operate correctly?**

  YES : The fault was caused by an inoperative interior rear view mirror. The system is now operating correctly.

  NO : Go to V11.

V11 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

V12 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test W: The SYNC System Audible Prompts Are Inoperative/Do Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The text-to-speech (TTS) and voice prompt features speak certain text information and interaction requests in

order to minimize driver distraction by having to look at the audio control module (ACM) while driving. The ring tone alerts the driver to an incoming call.

Audible prompts can range from a simple tone to more elaborate spoken text, based on the customer setting. When interaction mode is set to standard, detailed guidance is provided. When interaction mode is set to advanced, most prompts are tones only and minimal audible guidance is provided. Refer to the Owner's Literature for further information on voice interaction.

The audio signals for the TTS and voice prompt features, the ring tones, and audio from the outside device during a phone call, are sent from the accessory protocol interface module (APIM) to the ACM through circuits VMN14 (WH/VT) and RMN14 (GY/BN).

This pinpoint test is intended to diagnose the following:

- Customer setting
- Wiring, terminals or connectors
- ACM
- APIM

PINPOINT TEST W: THE SYNC SYSTEM AUDIBLE PROMPTS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

W1 CHECK THE AUDIBLE PROMPT SETTING

- Operate the audio system in SYNC mode.
- Verify the audible prompts are enabled. Refer to "SYNC Voice Recognition Feature" in the Owner's Literature.
- Press the VOICE button on the steering wheel controls and observe the SYNC audible prompt.
- **Does the SYNC system produce an audible prompt correctly?**

  YES : The concern was caused by a customer setting. ADVISE the customer on the operation of the audible prompt feature.

  NO : Go to W2.

W2 CHECK THE AUDIBLE PROMPT CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ACM C290c or C240c
- Disconnect: APIM C3338
- Key in ON position.

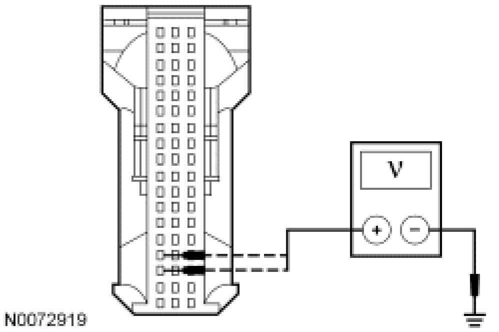

Fig. 36: Checking Audible Prompt Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the APIM C3338-3, circuit VMN14 (WH/VT), harness side and ground; and between the APIM C3338-4, circuit RMN14 (GY/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to W3.

W3 CHECK THE AUDIBLE PROMPT CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the APIM, harness side and the ACM, harness side; and between the APIM, harness side and ground as follows:

APIM Connector-Pin	ACM Connector-Pin	Circuit
C3338-3	C290c-4 or C240c-4	VMN14 (WH/VT)
C3338-4	C290c-5 or C240c-5	RMN14 (GY/BN)

- **Is the resistance less than 5 ohms between the APIM and the ACM, and greater than 10,000 ohms between the APIM and ground?**

  YES : Go to W4.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

W4 CHECK FOR A VOLTAGE SIGNAL FROM THE APIM

- Connect: ACM C290c or C240c
- Connect: APIM C3338
- Wait 2 minutes for the APIM to re-initialize.
- Operate the audio system in SYNC mode, and verify the audible prompts are enabled. Refer to "SYNC Voice Recognition Feature" in the Owner's Literature.
- While pressing the VOICE button repeatedly, measure the AC voltage by backprobing between the ACM C290c-4 (or C240c-4), circuit VMN14 (WH/VT), harness side and the ACM C290c-5 (or

C240c-5), circuit RMN14 (GY/BN), harness side.

- **Is an AC voltage produced each time the VOICE button is pressed?**

  YES : Go to W5.

  NO : Go to W6.

W5 CHECK FOR CORRECT ACM OPERATION

- Key in OFF position.
- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

W6 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Wait 2 minutes for the APIM to re-initalize.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **Accessory Protocol Interface Module (APIM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

GENERAL PROCEDURES

AUDIO UNIT PART NUMBER RETRIEVAL

Audio Systems Without Navigation

NOTE: **The terms "Audio Control Module (ACM)" and "audio unit" refer to the same**

component.

1. Turn the ACM on.
2. Press and hold preset buttons 3 and 6 for 3 seconds. The speaker walk-around test will begin.
3. Before the speaker walk-around test is complete, press preset button 6.

NOTE: This step will cause the ACM to auto-scroll through configuration 1, configuration 2, EEPROM number, and ACM part number.

4. Press the TUNE UP button.

NOTE: Step 4 may need to be repeated until the ACM part number can be recorded.

5. Record the ACM part number.
6. Turn the ACM off.

Navigation Audio System

1. Turn the ACM on.
2. Press and hold preset buttons 3 and 6 for 3 seconds. The speaker walk-around test will begin.
3. Before the speaker walk-around test is complete, press END TEST on the display screen.
4. Select SYSTEM INFO from the menu.
5. Record the ACM part number.
6. Turn the ACM off.

SATELLITE RADIO RECEIVER ELECTRONIC SERIAL NUMBER (ESN) RETRIEVAL

Audio Systems Without Navigation

1. Operate the audio system in satellite radio mode.
2. Press and hold the AUX button and preset button 1, simultaneously.
   - The satellite radio receiver Electronic Serial Number (ESN) will be displayed on the screen.
3. Record the satellite radio receiver ESN.
4. Turn the audio system off.

Audio Systems With Navigation

1. Turn the audio system on.
2. Press the MENU button.
3. Select the SYSTEM INFO tab.

NOTE: The satellite radio receiver ESN is shown on the lower left corner of the

screen with the text "SR ESN:".

4. Record the satellite radio receiver ESN.
5. Turn the audio system off.

ACCESSORY PROTOCOL INTERFACE MODULE (APIM) SOFTWARE LEVEL CHECK

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable	CCMUSB2-AM-AM-10 or equivalent

1. Turn the Audio Control Module (ACM) on.
2. Connect the scan tool to the Data Link Connector (DLC).
3. Connect one end of the Universal Serial Bus (USB) male-A to male-A cable to the scan tool.
4. Connect the other end of the USB male-A to male-A cable to the vehicle USB port.
5. From the technician service publication website, run On-Line Automotive Service Information System (OASIS) using Quick Start or by manually entering the Vehicle Identification Number (VIN).
6. From the OASIS tab, select the "Sync/APIM" bullet.
7. Select the "Read APIM" button to verify the current Accessory Protocol Interface Module (APIM) software level.
    - The display shows both the Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.
8. The scan tool displays the following information:
    - Last Recorded State - Hardware
        - VIN: vehicle identification number associated with the current APIM
        - Installed date: date the APIM was installed
        - Radio: currently identified ACM in the vehicle
        - HW Part No.: APIM hardware part number
        - Un-installed date: date (if any) the APIM was uninstalled
        - S/N: APIM serial number
    - Last Recorded State - Software

  - Date/Time: date and time of last recorded software installation
  - VIP: VIP software that was installed at that time
  - CIP: CIP software that was installed at that time
  - Description: a description of the content of the software revision
- History - Software
  - Date/Time: date and time of any recorded software installation
  - VIP: VIP software that was installed at that time
  - CIP: CIP software that was installed at that time
  - Description: a description of the content of the software revision
- Available Software for Programming
  - Select: allows the software package to be selected
  - Lineage: the original software release, if the software available is a revision
  - VIP: VIP software level that is available with the selection
  - CIP: CIP software level that is available with the selection
  - Description: a description of the content of the software revision

9. Click a CIP software level to view the device compatibility list associated with the CIP software level, if desired.
10. To exit the APIM software level check, disconnect the scan tool from the DLC and the USB port, or exit the OASIS screen.

REMOVAL AND INSTALLATION

ANTENNA

NOTE: Combination AM/FM/satellite antenna shown, others similar.

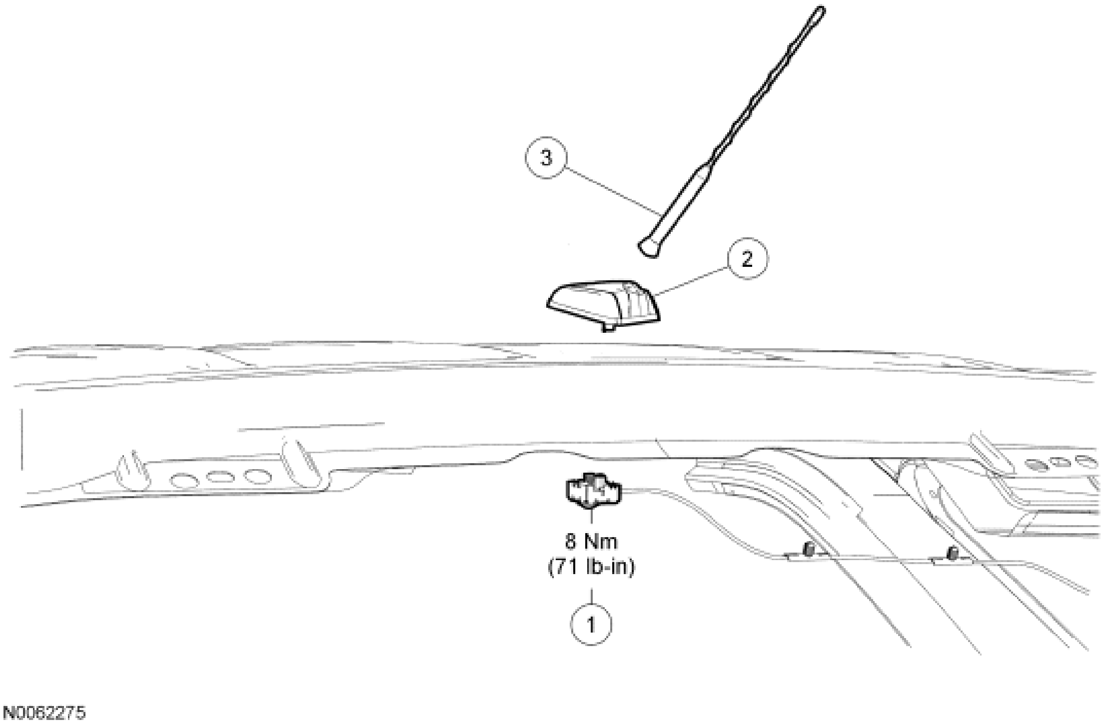

Fig. 37: Exploded View Of Antenna With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Antenna cable bolt (part of 18812)
2	18936	Antenna
3	18813	Antenna mast

REMOVAL AND INSTALLATION

1. Remove the LH and RH assist handles. For additional information, refer to Headliner in **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the LH and RH C-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Carefully lower the rear of the headliner to gain access to the antenna.
4. Loosen the antenna cable bolt and disconnect the cable from the antenna.
   - To install, tighten to 8 Nm (71 lb-in).
5. Remove the antenna.
   - Remove the antenna mast, if equipped.
   - Press the 2 tabs and remove the antenna.
6. To install, reverse the removal procedure.

ANTENNA MODULE

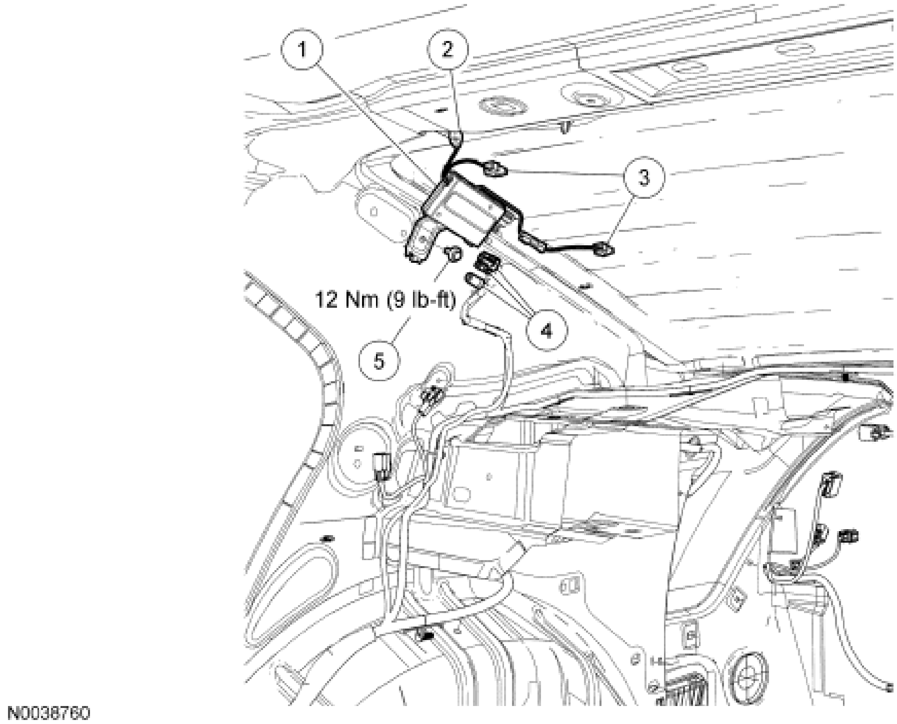

Fig. 38: Exploded View Of Antenna Module With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	19C029	Antenna module
2	-	Antenna module-to-antenna connector (part of 19C029)
3	-	Heated rear window connectors (part of 19C029)
4	-	Antenna module electrical connectors (part of 14A005)
5	-	Antenna module bolt

REMOVAL AND INSTALLATION

1. Remove the RH C-pillar trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the antenna module connectors.
   - Disconnect the antenna cable-to-antenna module connector.
   - Disconnect the antenna module electrical connectors.
   - Disconnect the antenna module-to-antenna connector.
3. Remove the bolt and the antenna module.
   - To install, tighten to 12 Nm (9 lb-ft).
4. To install, reverse the removal procedure.

AUDIO DIGITAL SIGNAL PROCESSING (DSP) MODULE

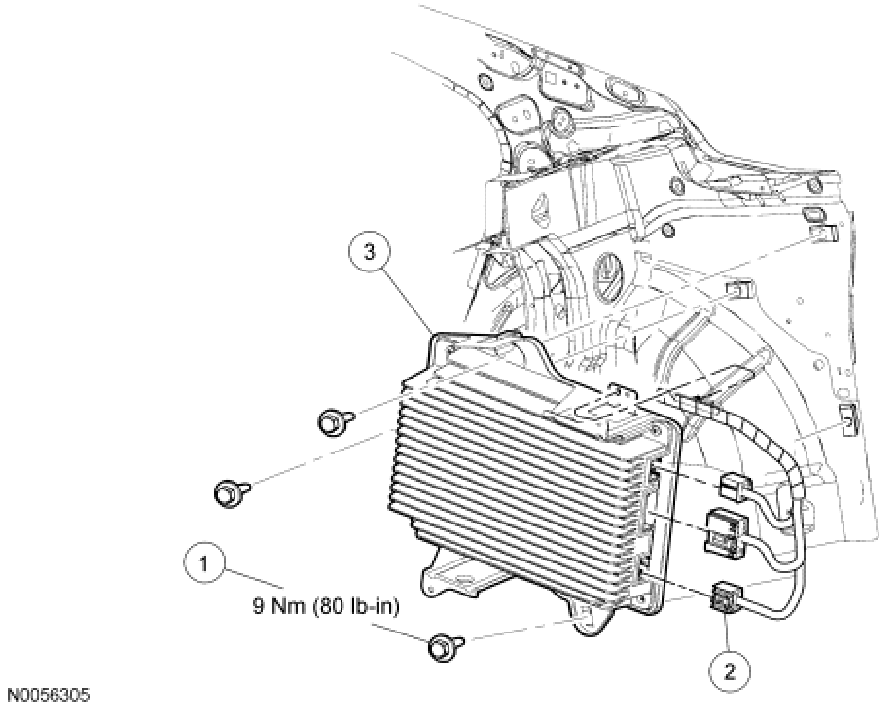

Fig. 39: Exploded View Of Audio Amplifier With Torque Specification - THX(R)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505423-S	Audio Digital Signal Processing (DSP) module bolts (3 required)
2	-	Audio DSP module electrical connectors (part of 14A005)
3	18B849	Audio DSP module

REMOVAL AND INSTALLATION

NOTE: Module configuration is only required if a new audio Digital Signal Processing (DSP) module is being installed.

1. Upload the audio DSP module configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in **MODULE CONFIGURATION** article.
2. Remove the 4 pushpins and the RH luggage compartment trim panel.
3. Disconnect the audio DSP module electrical connectors.
4. Remove the 3 bolts and the audio DSP module.
    - To install, tighten to 9 Nm (80 lb-in).
5. To install, reverse the removal procedure.

- Download the configuration information to the audio DSP module. For additional information, refer to PMI in **MODULE CONFIGURATION** article.

AUDIO INPUT JACK

NOTE: Stowage bin door shown removed for clarity.

NOTE: Vehicle with the SYNC system shown, others similar.

NOTE: Fusion, Milan shown, MKZ similar.

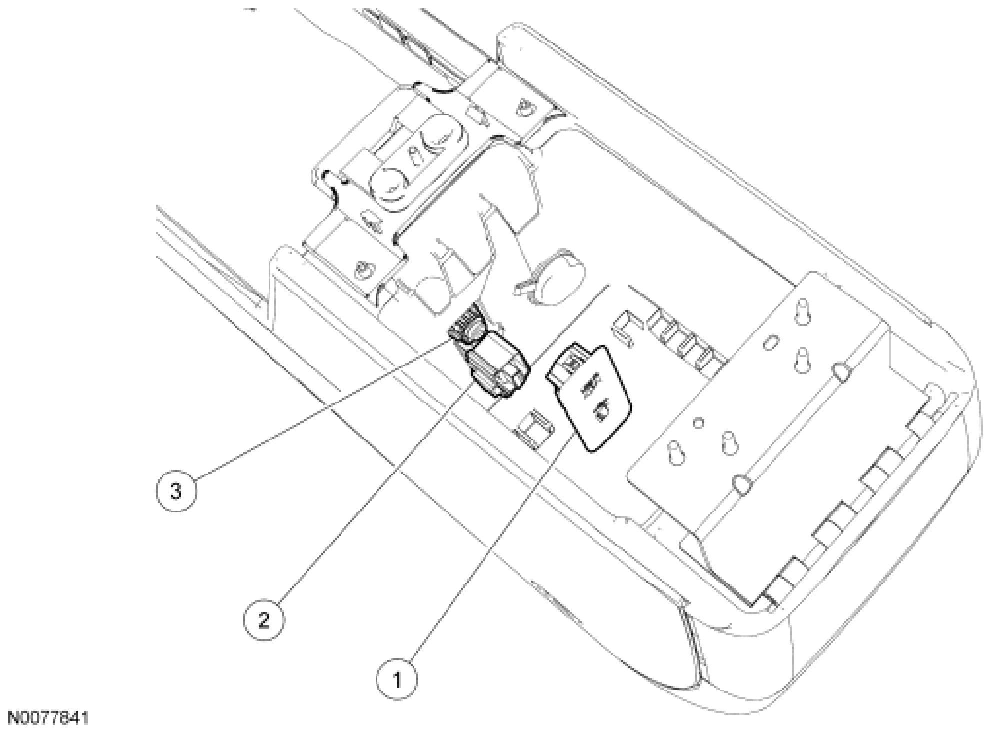

Fig. 40: Exploded View Of Audio Input Jack
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Audio input jack bezel
2	-	Universal Serial Bus (USB) cable and port (if equipped) (part of 14D202)
3	19A164	Audio input jack

REMOVAL AND INSTALLATION

1. Open the floor console stowage bin door.
2. Using a suitable tool, remove the audio input jack bezel by prying straight back (Fusion, Milan) or

straight up (MKZ).

- Disconnect the Universal Serial Bus (USB) cable and port, if equipped.

3. Release the tabs and remove the audio input jack.

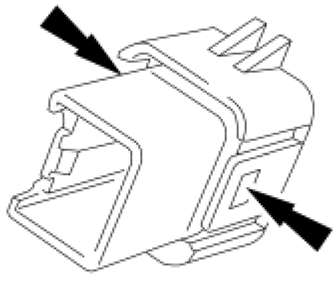

Fig. 41: Identifying Tabs On Audio Input Jack
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

AUDIO CONTROL MODULE (ACM) - FUSION, MILAN

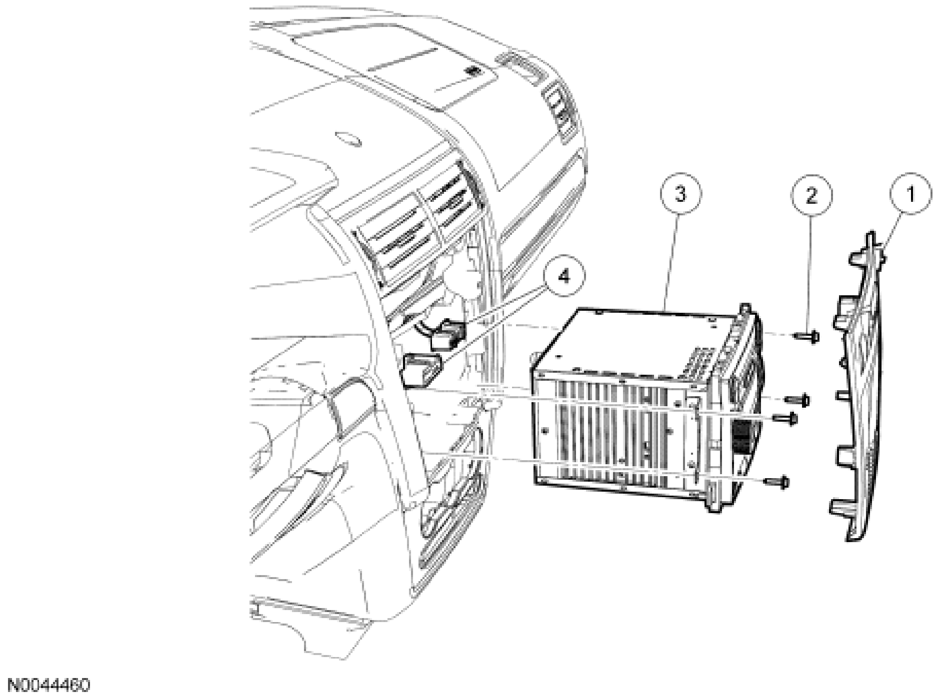

Fig. 42: Exploded View Of Audio Unit - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Instrument panel center finish panel

2	W707628	Audio Control Module (ACM) screws (4 required)
3	18806	ACM
4	-	ACM electrical connectors (part of 14401)

REMOVAL AND INSTALLATION

NOTE: **It is not necessary to remove the Audio Control Module (ACM) to retrieve the part number. For additional information, refer to Audio Unit Part Number Retrieval.**

NOTE: **Module configuration is only required if a new ACM is being installed.**

1. Upload the ACM configuration information to the scan tool. For additional information, refer to **MODULE CONFIGURATION** article.
2. Remove the instrument panel center finish panel.
   - Disengage the clips.
3. Remove the 4 screws and the ACM.
   - Disconnect the electrical connectors and the antenna lead-in cable.
4. To install, reverse the removal procedure.
   - Download the configuration information to the ACM. For additional information, refer to **MODULE CONFIGURATION** article.

AUDIO CONTROL MODULE (ACM) - MKZ

NOTE: **Navigation Audio Control Module (ACM) shown; others similar.**

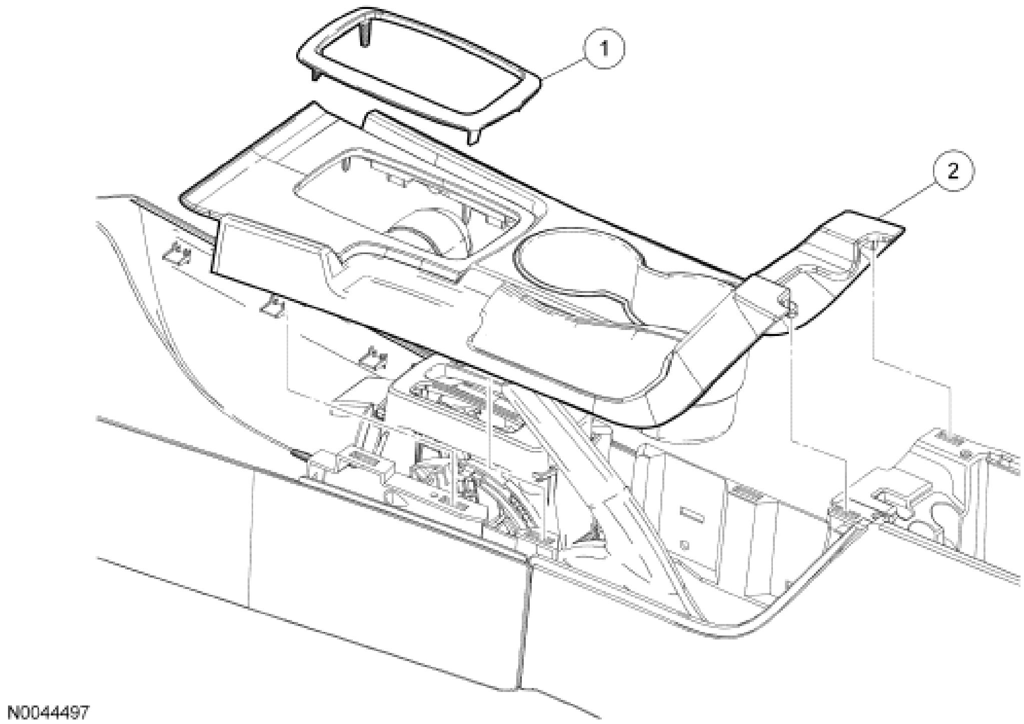

Fig. 43: Exploded View Of Floor Console Finish Panel
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Floor console finish panel trim ring
2	-	Floor console finish panel

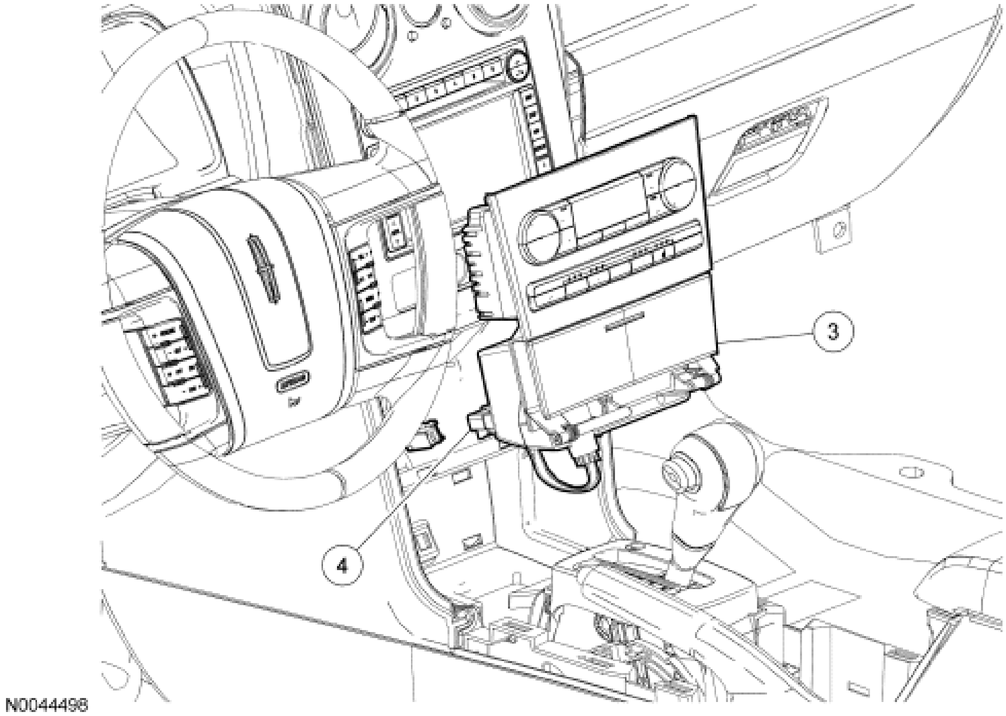

Fig. 44: Exploded View Of Climate Control & Bezel Assembly
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
3	-	Climate control and bezel assembly
4	-	Climate control and bezel assembly electrical connectors (part of 14401)

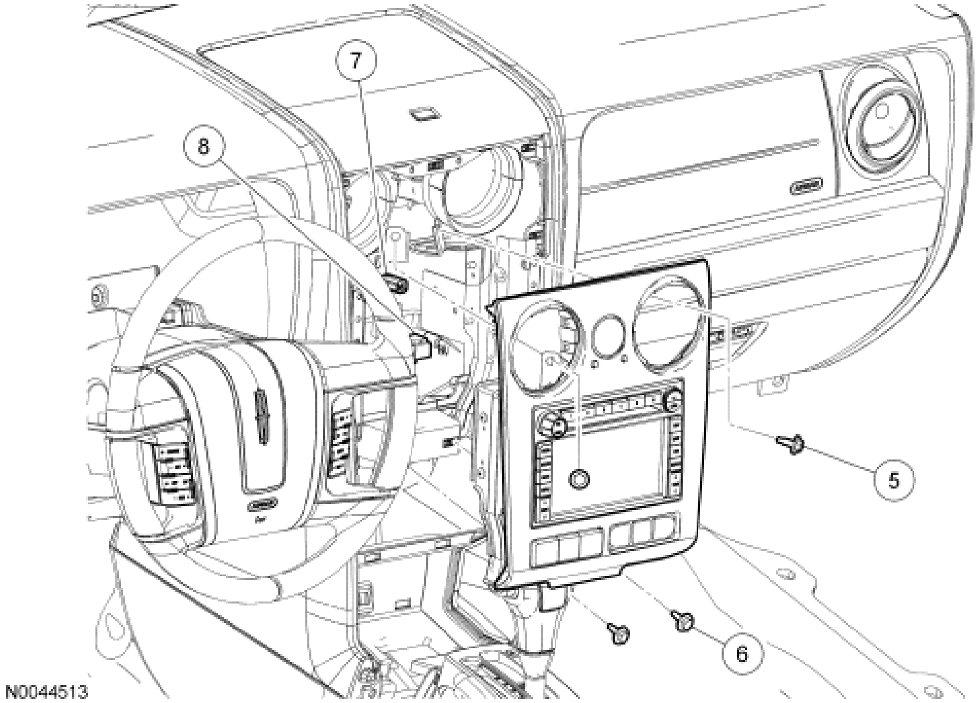

Fig. 45: Exploded View Of ACM & Bezel Assembly
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
5	-	Audio Control Module (ACM) bracket upper bolts (2 required)
6	-	ACM bracket lower bolts (2 required)
7	-	Navigation antenna connector (part of 14401)
8	-	ACM electrical connectors (part of 14401)

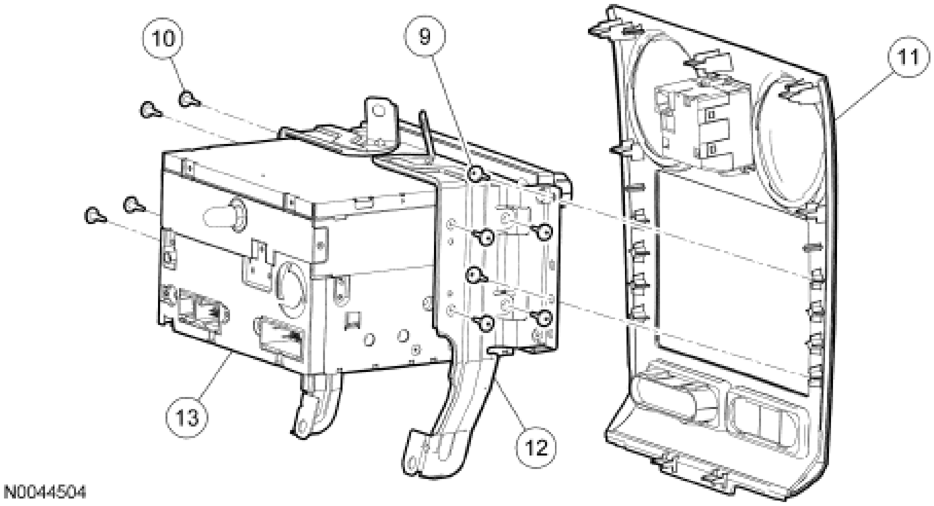

Fig. 46: Exploded View Of ACM

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
9	-	Audio Control Module (ACM) bracket-to-bezel screws (4 required)
10	-	ACM bracket-to-ACM screws (8 required)
11	-	Instrument panel center finish panel
12	-	ACM bracket (2 required)
13	18801	ACM

REMOVAL AND INSTALLATION

NOTE: It is not necessary to remove the ACM to retrieve the part number. For additional information, refer to <u>Audio Unit Part Number Retrieval</u>.

NOTE: For the navigation ACM, remove the navigation DVD before installing a new ACM, if possible.

NOTE: Module configuration is only required if a new ACM is being installed.

1. Upload the ACM configuration information to the scan tool. For additional information, refer to **MODULE CONFIGURATION** article.
2. Remove the floor console finish panel trim ring.
    - Disengage the clips.

NOTE: Apply the parking brake and pull the shift lever all the way back to ease removal.

3. Open the floor console storage compartment and remove the floor console finish panel.
    - Disengage the clips.
4. Remove the climate control and bezel assembly screw.
    - Open the ash receptacle door and remove the ash receptacle to access the screw.

NOTE: Close the ash receptacle door and pull gently, starting at the bottom of the bezel, in order to disengage the clips. Failure to follow this instruction may result in damage to the climate control and bezel assembly.

5. Remove the climate control and bezel assembly.
    - Disengage the clips.
    - Disconnect the electrical connectors.
6. Remove the center A/C ducts by opening the vents and pulling them straight out.
7. Remove the center A/C duct retainers.

- Using an appropriate tool, release the tabs and pull the retainers out.

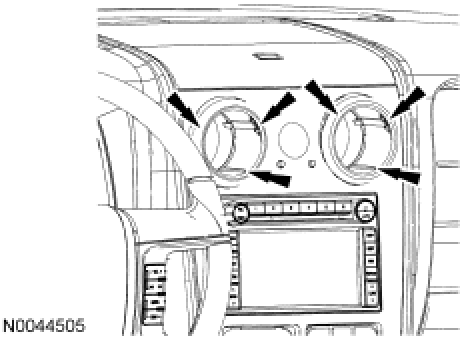

Fig. 47: Locating Center A/C Duct Retainers
Courtesy of FORD MOTOR CO.

8. Remove the ACM and bezel assembly.
   - Remove the 2 upper and 2 lower bolts.
   - Disengage the clips.
   - Disconnect the antenna and electrical connectors.
9. Remove the ACM.
   - Remove the 4 ACM bracket-to-bezel screws.
   - Remove the 8 ACM bracket-to-ACM screws.
   - Remove the ACM brackets from the ACM.
10. To install, reverse the removal procedure.
    - Download the configuration information to the ACM. For additional information, refer to **MODULE CONFIGURATION** article.

DOOR SPEAKER

NOTE: **Fusion and Milan shown.**

NOTE: **Front door shown, rear door similar.**

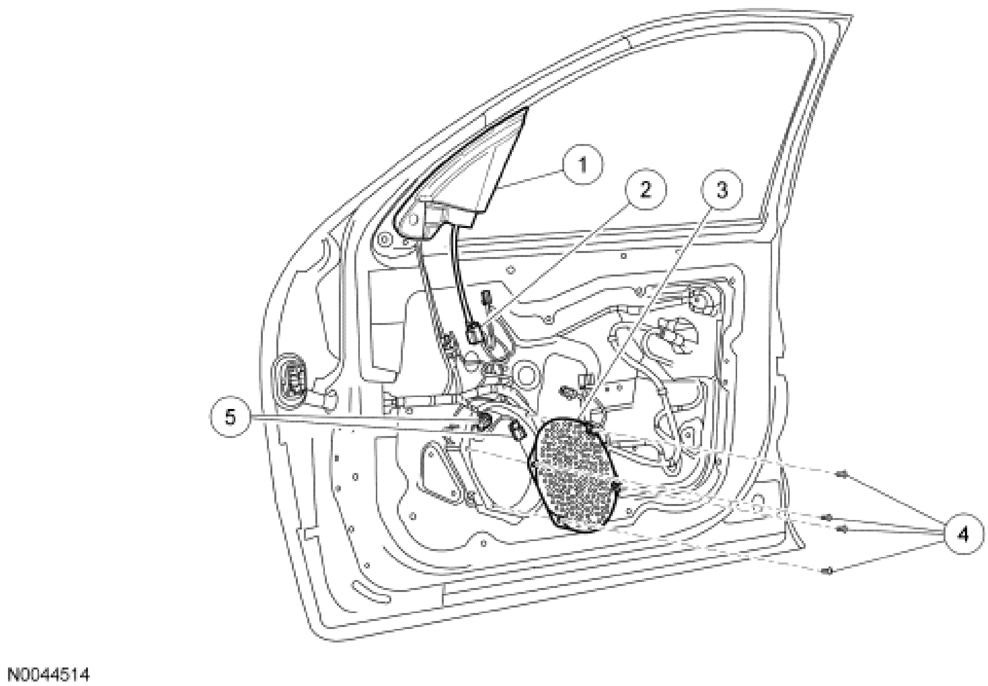

Fig. 48: Exploded View Of Door Speaker
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Sail panel
2	-	Front door tweeter speaker electrical connector (part of 18808)
3	18808	Door speaker
4	-	Door speaker screws (4 required)
5	-	Door speaker electrical connectors (part of 14630/14631)

REMOVAL AND INSTALLATION

All speakers

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

   Front door tweeter speaker (Fusion and Milan)

2. Remove the sail panel.
   - Disconnect the electrical connector.
3. Remove the 2 screws and the front door tweeter speaker from the sail panel.

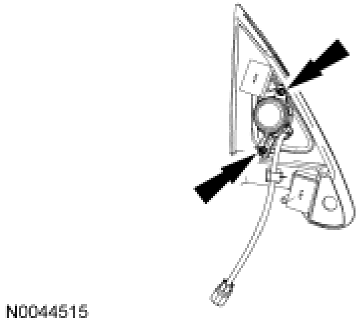

Fig. 49: Locating Front Door Tweeter Speaker Screws
Courtesy of FORD MOTOR CO.

Front door tweeter speaker (MKZ)

4. Remove the 2 nuts and the front door tweeter speaker from the door trim panel.

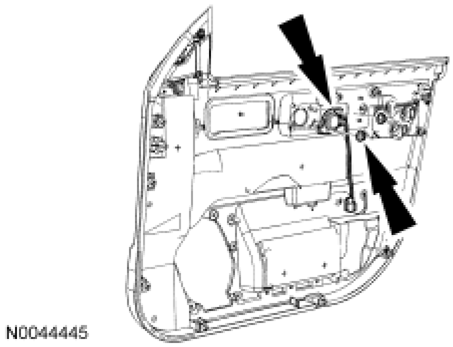

Fig. 50: Locating Front Door Tweeter Speaker Nuts
Courtesy of FORD MOTOR CO.

Front or rear door speaker

5. Remove the 4 screws and the door speaker.
   - Disconnect the electrical connectors.

All speakers

6. To install, reverse the removal procedure.

GLOBAL POSITIONING SYSTEM (GPS) ANTENNA

NOTE:	**Steering wheel shown removed for clarity.**

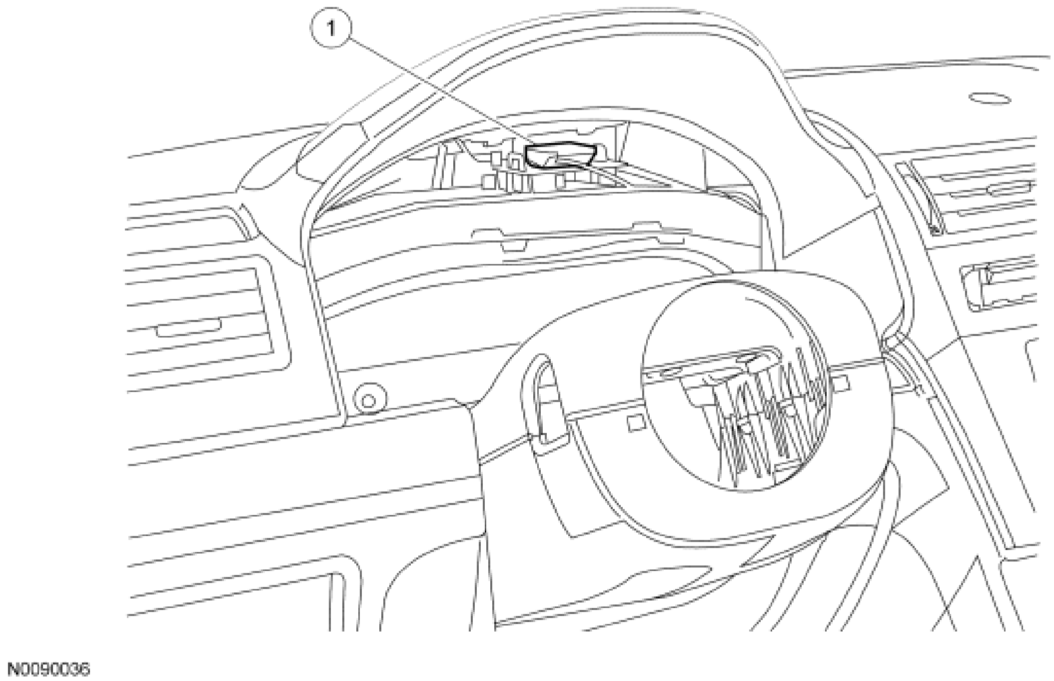

Fig. 51: Exploded View Of Global Positioning System (GPS) Antenna
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	10E893	Global Positioning System (GPS) antenna

REMOVAL AND INSTALLATION

1. Remove the Audio Control Module (ACM). For additional information, refer to **Audio Control Module (ACM) - Fusion, Milan** or **Audio Control Module (ACM) - MKZ**.
2. Remove the Instrument Cluster (IC). For additional information, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
3. Release the clip and remove the GPS antenna.
4. To install, reverse the removal procedure.

INSTRUMENT PANEL SPEAKER

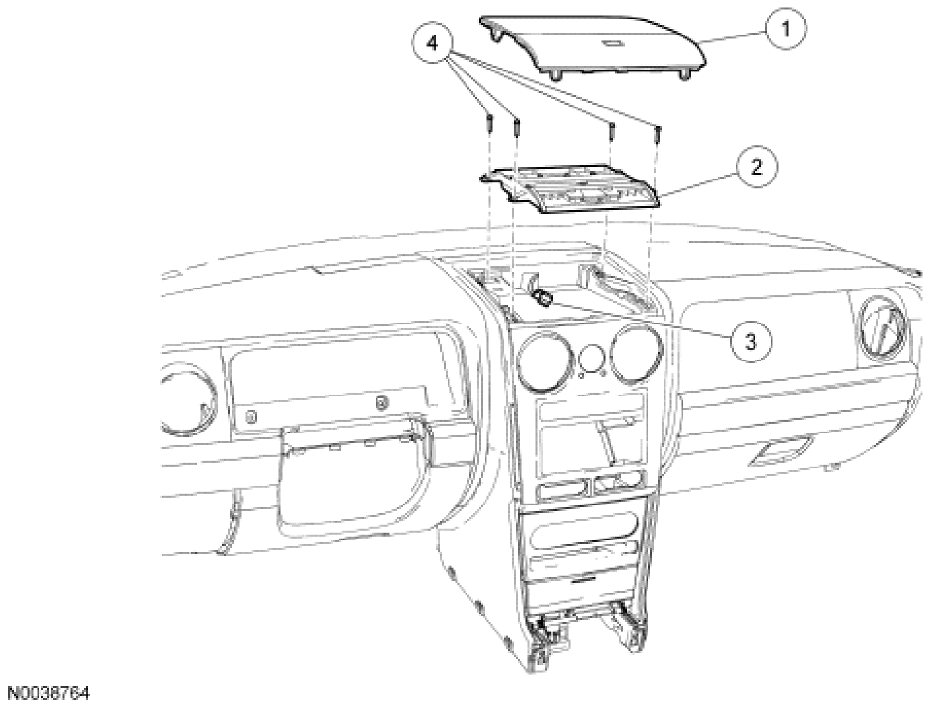

Fig. 52: Exploded View Of Instrument Panel Speaker
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	54044A92	Instrument panel speaker cover
2	18808	Instrument panel speaker
3	-	Instrument panel speaker electrical connector (part of 14401)
4	-	Instrument panel speaker screws (4 required)

REMOVAL AND INSTALLATION

1. Remove the instrument panel speaker cover.
2. Remove the 4 screws and the instrument panel speaker.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

PARCEL SHELF SPEAKER

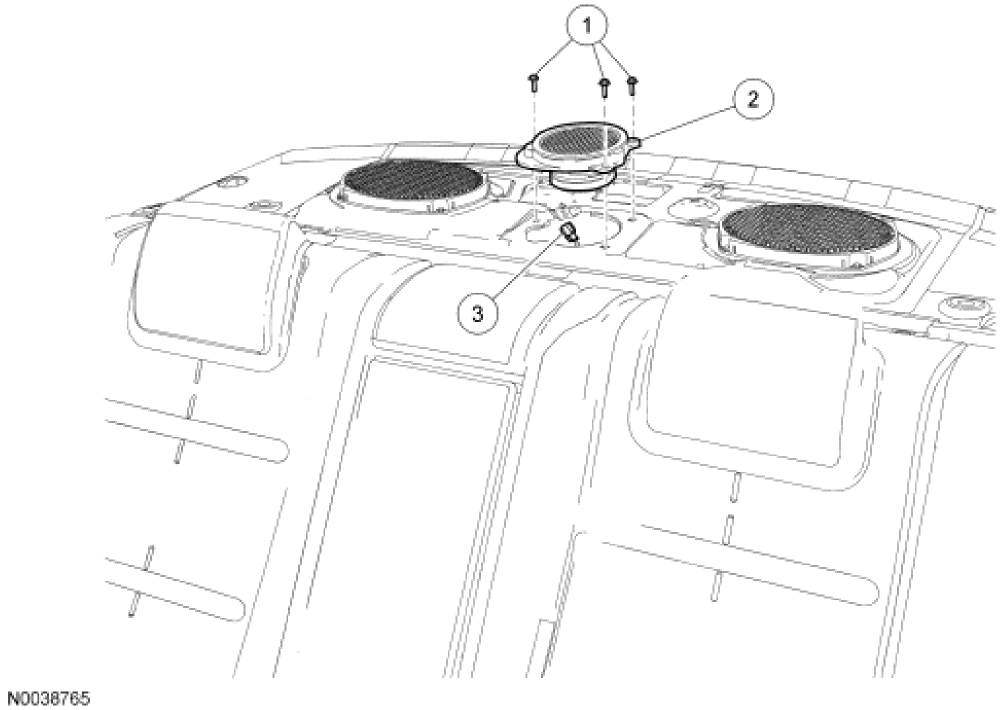

Fig. 53: Exploded View Of Parcel Shelf Speaker
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Parcel shelf speaker screws (3 required)
2	18808	Parcel shelf speaker
3	-	Parcel shelf speaker electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the 3 screws and the parcel shelf speaker.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS) MODULE

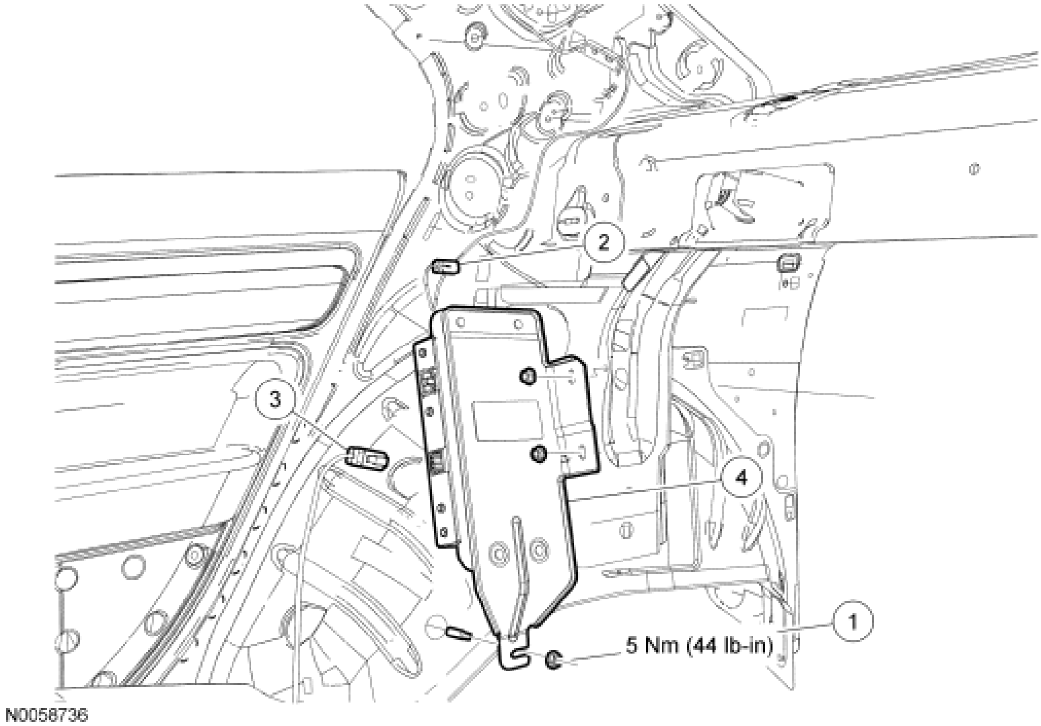

Fig. 54: Exploded View Of Satellite Radio Receiver With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706131-S437	Satellite Digital Audio Receiver System (SDARS) module nuts (3 required)
2	18812	Satellite radio antenna cable electrical connector
3	-	SDARS module electrical connector (part of 14A005)
4	18C851	SDARS module

REMOVAL AND INSTALLATION

NOTE: Module configuration is only required if a new Satellite Digital Audio Receiver System (SDARS) module is being installed.

1. Upload the SDARS module configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in **MODULE CONFIGURATION** article.
2. Remove the rear seat backrest. For additional information, refer to **SEATING** article.
3. Disconnect the satellite radio antenna cable and the SDARS module electrical connectors.
4. Remove the 3 nuts and the SDARS module.
   - To install, tighten to 5 Nm (44 lb-in).
5. To install, reverse the removal procedure.
   - Download the configuration information to the SDARS module. For additional information, refer to PMI in **MODULE CONFIGURATION** article.

STEERING WHEEL CONTROLS

NOTE: Fusion shown, Milan similar.

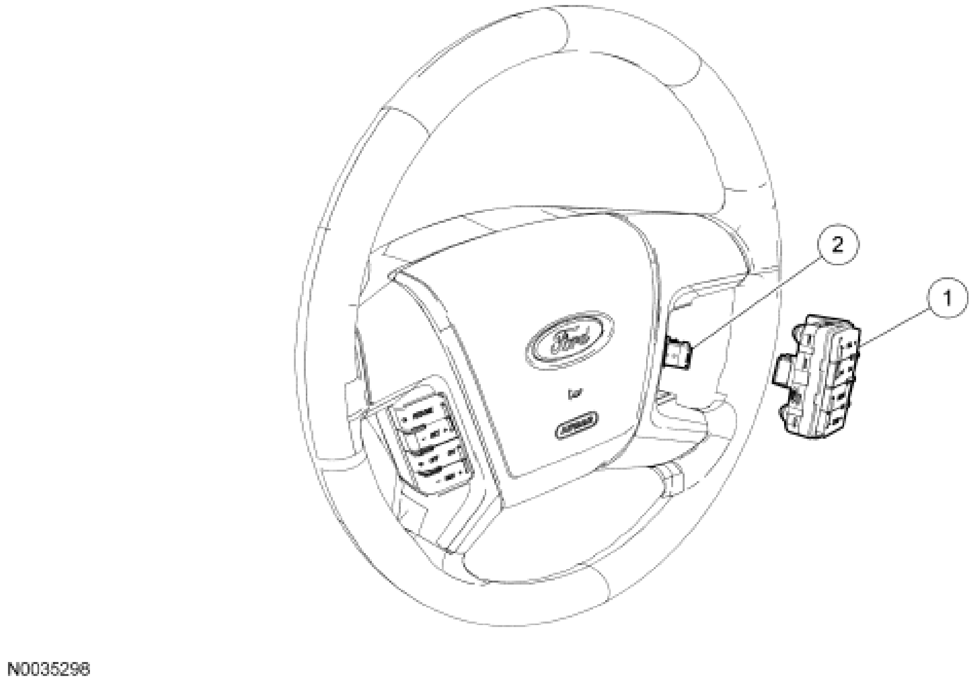

Fig. 55: Exploded View Of Steering Wheel Controls - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	9C888	Steering wheel controls
2	-	Steering wheel controls electrical connector (part of 14A411)

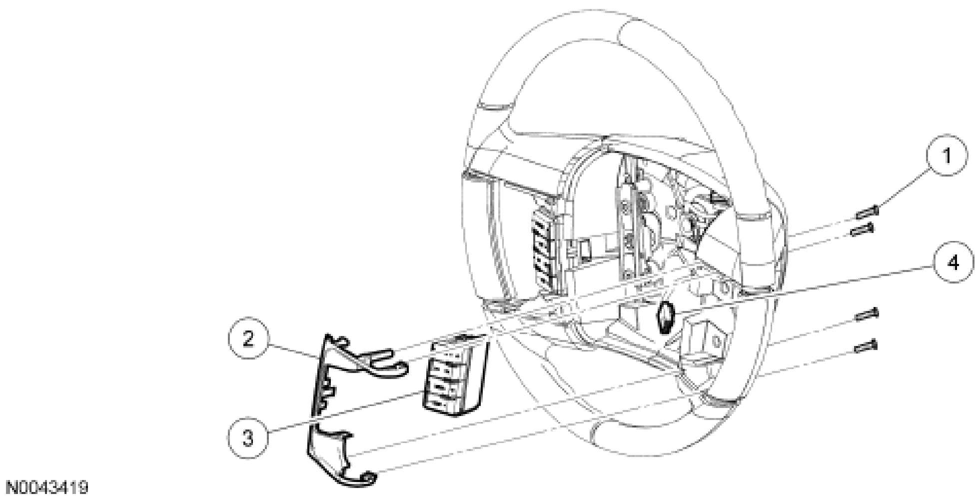

Fig. 56: Exploded View Of Steering Wheel Controls - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Steering wheel controls bezel screws (4 required)
2	-	Steering wheel controls bezel
3	9C888	Steering wheel controls
4	-	Steering wheel controls electrical connector (part of 14A411)

REMOVAL AND INSTALLATION

MKZ

1. Remove the driver air bag module. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
2. Remove the 4 screws and the steering wheel controls bezel.

   All vehicles

3. Remove the steering wheel controls by pulling the switch toward the rear of the vehicle.
   - Disconnect the electrical connector.
4. Remove the steering wheel controls bezel, if equipped.
5. To install, reverse the removal procedure.

SUBWOOFER AMPLIFIER

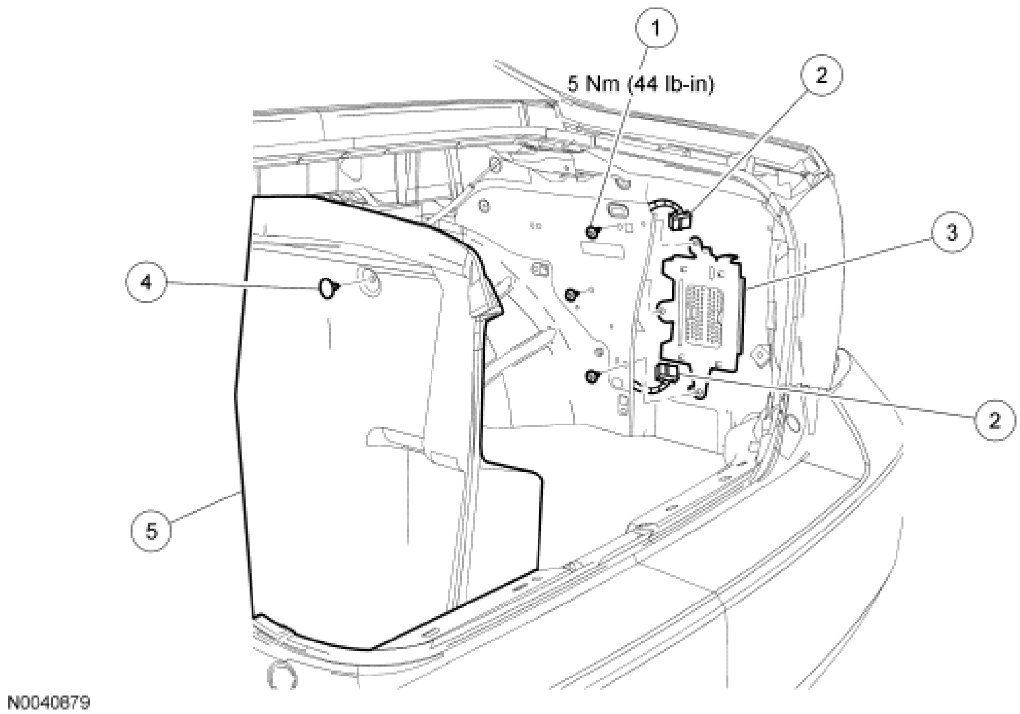

Fig. 57: Exploded View Of Subwoofer Amplifier With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W503924	Subwoofer amplifier screws (3 required)
2	-	Subwoofer amplifier electrical connectors (part of 14A005)
3	18B849	Subwoofer amplifier
4	N802734	RH luggage compartment trim panel pushpins (4 required)
5	5445422	RH luggage compartment trim panel

REMOVAL AND INSTALLATION

NOTE: Make sure the key is in the OFF position.

1. Remove the 4 pushpins and the RH luggage compartment trim panel.
2. Disconnect the subwoofer amplifier electrical connectors.
3. Remove the 3 screws and the subwoofer amplifier.
    - To install, tighten to 5 Nm (44 lb-in).
4. To install, reverse the removal procedure.

SUBWOOFER SPEAKER

NOTE: **RH side shown, LH side similar.**

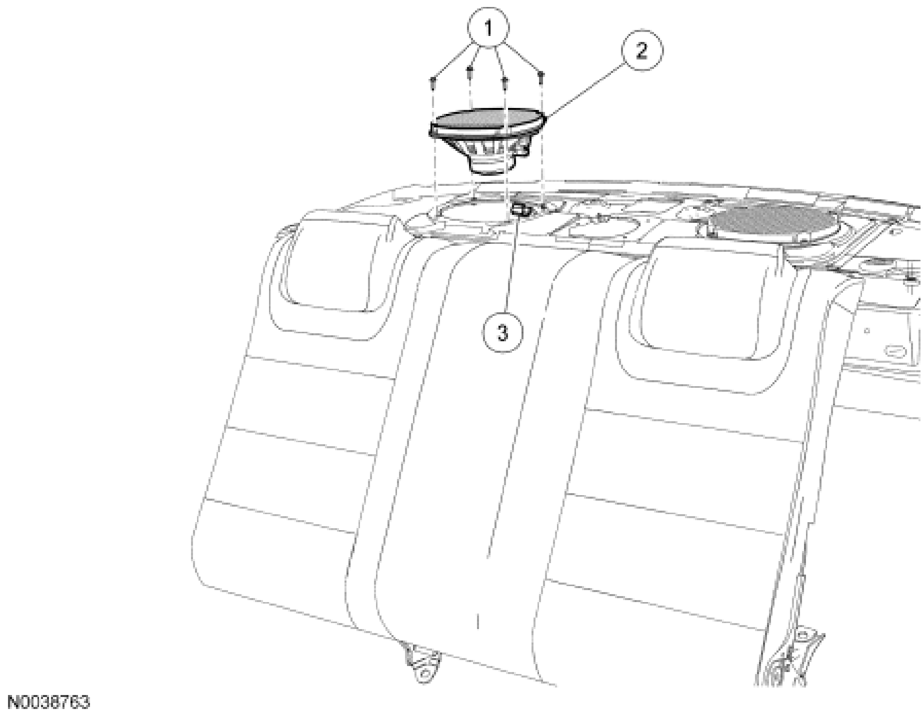

Fig. 58: Exploded View Of Subwoofer Speaker
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Subwoofer speaker screws (4 required)
2	18808	Subwoofer speaker
3	-	Subwoofer speaker electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the 4 screws and the subwoofer speaker.
    - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

ACCESSORY PROTOCOL INTERFACE MODULE (APIM)

NOTE: **Fusion, Milan shown, MKZ similar.**

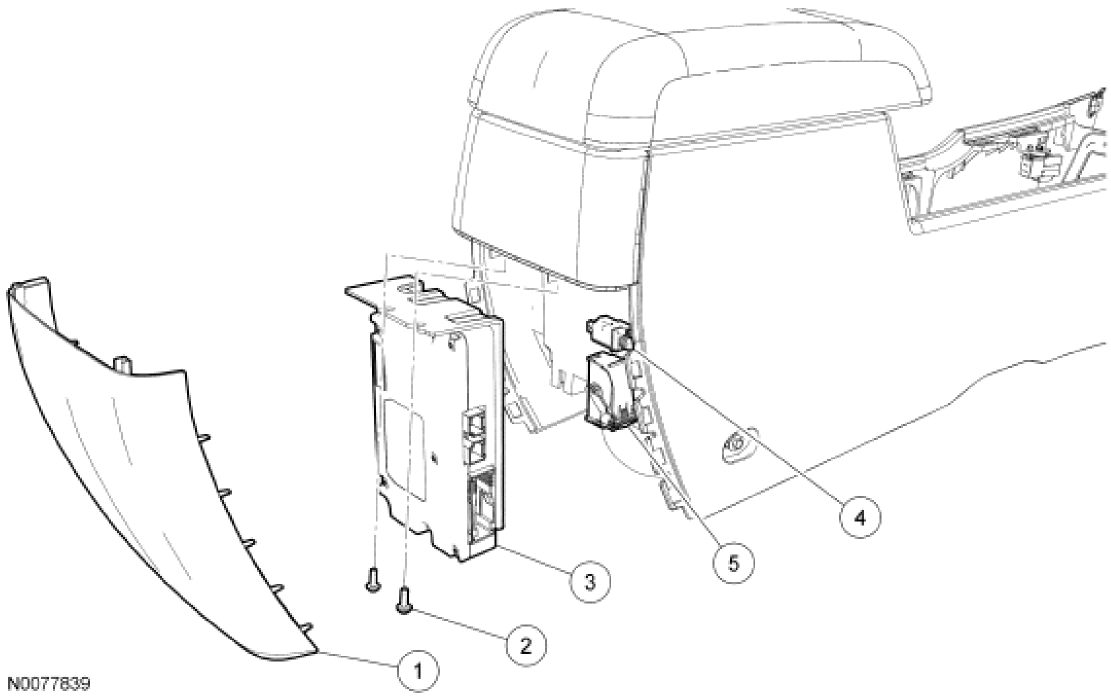

Fig. 59: Exploded View Of Accessory Protocol Interface Module (APIM)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Floor console rear trim panel (part of 045A36)
2	W505060-S	Accessory Protocol Interface Module (APIM) screws (2 required [Fusion, Milan], 4 required [MKZ])
3	14D212	APIM
4	14D202	Universal Serial Bus (USB) cable
5	-	APIM electrical connector (part of 14B079)

REMOVAL AND INSTALLATION

NOTE: Accessory Protocol Interface Module (APIM) reprogramming is only necessary if a new module is being installed.

1. Verify the current APIM software and hardware level. For additional information, refer to Accessory Protocol Interface Module (APIM) Reprogramming **MODULE CONFIGURATION** article.
2. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
3. Remove the floor console rear trim panel by pulling straight back to disengage the clips.

NOTE: For Fusion, Milan, the APIM is removed as an assembly with the bracket.

4. Remove the 2 screws (Fusion, Milan) or 4 screws (MKZ) and the APIM.

- Disconnect the APIM electrical connector.
- Disconnect the Universal Serial Bus (USB) cable.

5. To install, reverse the removal procedure.
    - Reprogram the APIM. For additional information, refer to **MODULE CONFIGURATION** article.

UNIVERSAL SERIAL BUS (USB) CABLE AND PORT

NOTE: Fusion, Milan shown, MKZ similar.

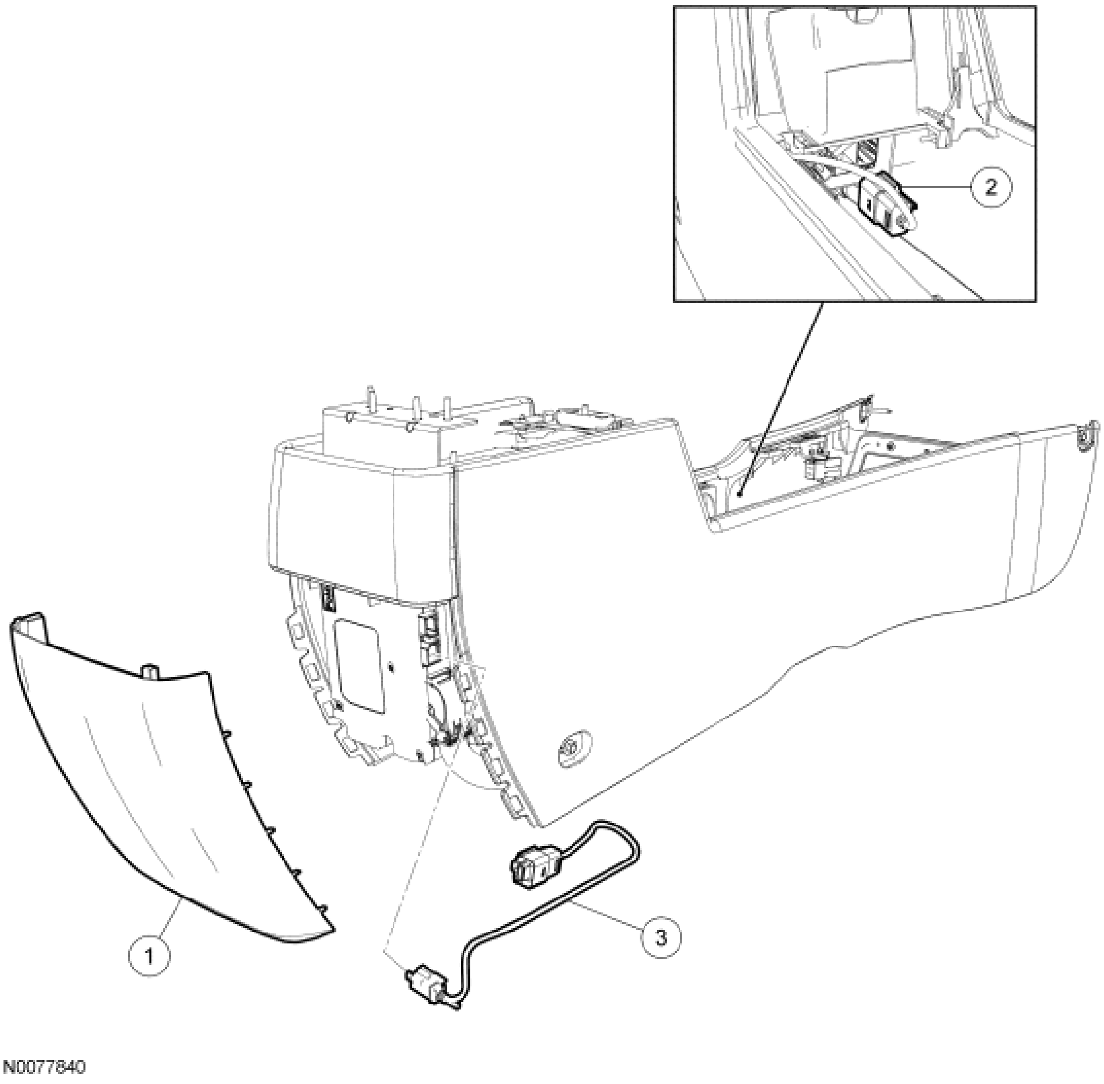

Fig. 60: Exploded View Of Universal Serial Bus (USB) Cable & Port
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Floor console rear trim panel (part of 045A36)

2	-	Universal Serial Bus (USB) cable and port-to-bezel connector (part of 14D202)
3	14D202	USB cable and port

REMOVAL AND INSTALLATION

1. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Disconnect the Universal Serial Bus (USB) cable and port-to-bezel connector.
3. Remove the floor console rear trim panel by pulling straight back to disengage the clips.

NOTE: **Be careful not to flex the floor console RH side panel too much, or damage to the floor console may occur.**

4. Remove the USB cable and port.
   - Disconnect the USB cable and port-to-Accessory Protocol Interface Module (APIM) electrical connector.
   - Carefully flex the floor console RH side panel and remove the USB cable and port.
5. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Instrument Cluster & Panel Illumination - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

INSTRUMENT CLUSTER AND PANEL ILLUMINATION

The instrument cluster and panel illumination is used to provide back lighting to the dimmable and non-dimmable switches and control components.

For MKZ vehicles equipped with autolamps, if the exterior lamps are activated during daytime sunload conditions, the message center, audio control module (ACM), heating ventilation air conditioning (HVAC) module and switch illumination remain at full intensity and do not dim from the instrument panel dimmer switch during this condition. If the vehicle travels under a bridge or a tunnel, the low level of ambient light causes the illumination level of the message center, ACM, HVAC module and switch to change to the level set by the instrument panel dimmer switch. The message center, ACM, HVAC module and switch illumination change back to full intensity when the intense ambient light is restored.

Dimmable Backlighting

The dimmable switches and components are illuminated when the headlamp switch is in either the PARKING LAMPS ON or HEADLAMPS ON position. The level of intensity is adjustable by rotating the instrument panel dimmer switch either up to increase intensity or down to decrease intensity. The dimmable switches and components consist of:

- Ashtray
- Audio control module (ACM)
- Clock
- Deck lid release switch
- Door lock control switches (MKZ)
- Hazard/passenger air bag disable/traction control switch (if equipped)
- Headlamp switch
- Heating ventilation air conditioning (HVAC) module
- Instrument cluster (IC)
- Instrument panel dimmer switch
- Memory set switch (if equipped)
- Message center switch
- Speed control switches
- Steering wheel audio control switches
- Transaxle range (TR) indicator
- Window adjust switches (MKZ)

Non-Dimmable Backlighting

The non-dimmable lighting switches and components are illuminated when the accessory delay relay is energized. The non-dimmable switches and components are illuminated at full lamp intensity. The non-dimmable lighting switches and components consist of:

- Cigar lighter
- Door lock control switches (Fusion, Milan)
- Roof opening panel switch (if equipped)
- Window adjust switches (Fusion, Milan)

DIAGNOSTIC TESTS

INSTRUMENT CLUSTER AND PANEL ILLUMINATION

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communications Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

Hardwired Dimmable Illumination

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

When the parking lamps or the headlamps are on, the SJB monitors the input from the instrument panel dimmer switch. The SJB sends a pulse-width modulated (PWM) voltage to the dimmable switches and control components based on input received from the instrument panel dimmer switch.

Networked Controlled Dimmable Illumination

The SJB sends a message over the medium speed controller area network (MS-CAN) to the heating ventilation air conditioning (HVAC) module - electronic automatic temperature control (EATC), the audio control module (ACM), and the instrument cluster (IC) to indicate the back lighting intensity level. When any module does not receive the illumination signal, it defaults to full nighttime brightness. Full nighttime intensity is equivalent to the illumination level when the parking lamps are on, and the instrument panel dimmer switch is in the highest setting.

Non-Dimmable Illumination

When the ignition switch is in the START or RUN positions, the delayed accessory relay provides voltage from the SJB to the non-dimmable components.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Bulb(s) • Wiring, terminals or connectors • Illuminated components • Ashtray

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool release software.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the

PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
9. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1247	Panel Dim Switch Circuit Open	Go to **Pinpoint Test E**.
B2026	Incandescent Backlighting Output Circuit Failure	Go to **Pinpoint Test C**.
B2027	LED Backlighting Output Circuit Failure	Go to **Pinpoint Test C**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The control illumination is inoperative - all hardwired dimmable illumination	• Wiring, terminals or connectors • Instrument panel dimmer switch • SJB	• Go to **Pinpoint Test A**.
• The control illumination is inoperative - all non-dimmable illumination	• Fuse • Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test F**.
• The control illumination is always on - all hardwired illumination	• Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test D**.

• All control illumination sources do not dim	• Wiring, terminals or connectors • Instrument panel dimmer switch • SJB	• Go to **Pinpoint Test E**.

• All network-controlled illumination sources do not dim - hardwired illumination sources operate correctly	• Medium speed communication area network (MS-CAN) fault
	• SJB
		• Using the scan tool, CARRY OUT the network test.
		  ◦ If the SJB does not communicate with the scan tool, REFER to **MODULE COMMUNICATIONS NETWORK** article.
		  ◦ If the SJB does communicate with the scan tool, INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

• One or more (but not all) individual dimmable illumination sources are inoperative	• Wiring, terminals or connectors • Illumination source • Clockspring (steering wheel controls only) • SJB	• For the steering wheel controls, go to **Pinpoint Test B**. • For all others, go to **Pinpoint Test C**.
• One or more (but not all) non-dimmable illumination sources are inoperative	• Wiring, terminals or connectors • Illumination source • SJB	• Go to **Pinpoint Test G**.

• The instrument cluster (IC) illumination is inoperative	• IC
	• SJB
		• VERIFY that the IC is the only inoperative network controlled illumination source.
		  ◦ If the IC is the only inoperative network controlled illumination source, INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. TEST the system for normal operation.
		  ◦ If more than one network controlled illumination source is inoperative, INSTALL a new SJB.

		REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

• The audio control module (ACM) illumination is inoperative	• ACM
	• SJB
		• VERIFY that the ACM is the only inoperative network controlled illumination source.
		  • If the ACM is the only inoperative network controlled illumination source, INSTALL a new ACM. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. TEST the system for normal operation.
		  • If more than one network controlled illumination source is inoperative, INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

• The heating ventilation air conditioning (HVAC) module - electronic automatic temperature control (EATC) illumination is inoperative	• HVAC module-EATC
	• SJB
		• VERIFY that the HVAC module-EATC is the only inoperative network controlled illumination source.
		  • If the HVAC module-EATC is the only inoperative network controlled illumination source, INSTALL a new HVAC module-EATC. REFER to HVAC module in **CLIMATE CONTROL** article. TEST the system for normal operation.
		  • If more than one network controlled illumination source is inoperative, INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: The Control Illumination Is Inoperative - All Hardwired Dimmable Illumination

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and

connector information.

Normal Operation

When the parking lamps or the headlamps are on, the smart junction box (SJB) sends a reference voltage signal to the instrument panel dimmer switch on circuit VLN18 (BU/WH), which is grounded by the SJB through circuit CLN27 (WH/BN). The SJB uses the reference voltage to determine the intensity of the back lighting desired by the operator. The SJB sends a pulse-width modulated (PWM) voltage to the dimmable illumination sources on circuit VLN04 (VT/GY) based on the input received from the instrument panel dimmer switch.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB

PINPOINT TEST A: THE CONTROL ILLUMINATION IS INOPERATIVE - ALL HARDWIRED DIMMABLE ILLUMINATION

A1 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB dimmer switch status (DSWSTAT) PID while rotating the instrument panel dimmer switch from the lowest setting to the highest setting.
- **Does the DSWSTAT PID indicate the switch is operating correctly?**

  YES : Go to A2.

  NO : INSTALL a new instrument panel dimmer switch. REFER to **Instrument Panel Dimmer Switch**. TEST the system for normal operation.

A2 CHECK CIRCUIT VLN04 (VT/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280d

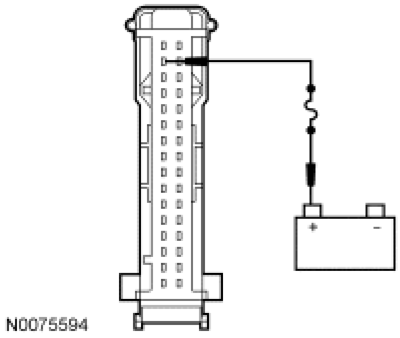

Fig. 1: Checking Circuit VLN04 (VT/GY) For An Open
Courtesy of FORD MOTOR CO.

NOTE: If the jumper wire fuse fails, repair circuit VLN04 (VT/GY) for a short to ground.

- Connect a fused jumper wire between the SJB C2280d-2, circuit VLN04 (VT/GY), harness side and battery positive.
- Observe the dimmable illumination sources.
- **Do the dimmable illumination sources illuminate?**

  YES : Go to A3.

  NO : REPAIR the circuit. TEST the system for normal operation.

A3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Steering Wheel Controls Illumination Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a pulse width modulated (PWM) voltage to the steering wheel controls through circuit VLN04 (VT/GY) to the clockspring. The PWM signal passes through the clockspring to circuit VLN04 (VT/GY) to the LH and RH control switches. Ground to the LH and RH steering wheel switch is supplied through circuit GD165 (BK).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Steering wheel control switch
- Clockspring

PINPOINT TEST B: THE STEERING WHEEL CONTROLS ILLUMINATION IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK FOR VOLTAGE TO THE STEERING WHEEL CONTROL SWITCHES

- Remove the speed control switch. Refer to **SPEED CONTROL** article.
- Remove the audio steering wheel controls. Refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
- With the parking lamps on, rotate the instrument panel dimmer switch to the full illumination position.

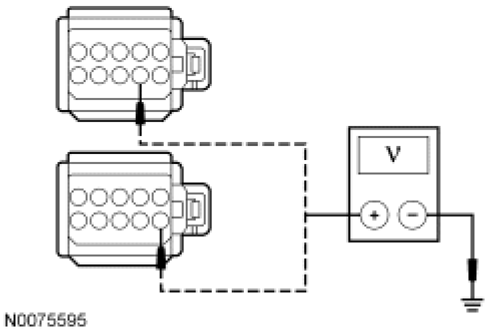

Fig. 2: Checking For Voltage To Steering Wheel Control Switches
Courtesy of FORD MOTOR CO.

- Measure the voltage between the speed control switch C2998-2, circuit VLN04 (VT/GY), harness side and ground; and between the audio steering wheel controls C2999-1, circuit VLN04 (VT/GY), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : TURN the parking lamps off. Go to B4.

  NO : Go to B2.

B2 CHECK CIRCUIT VLN04 (VT/GY) FOR AN OPEN IN THE STEERING WHEEL CONTROLS HARNESS

- Disconnect: Clockspring C218b

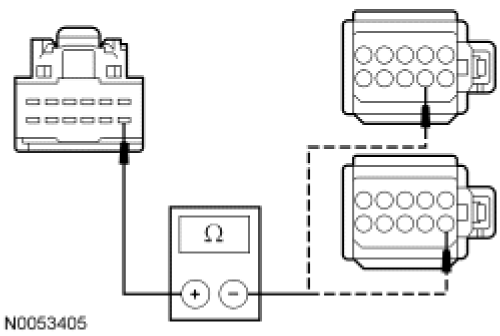

Fig. 3: Checking Steering Wheel Harness Circuit VLN04 (VT/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218b-7, circuit VLN04 (VT/GY), harness side and the speed control switch C2998-2, circuit VLN04 (VT/GY), harness side; and between the clockspring C218b-7, circuit VLN04 (VT/GY), harness side and the audio steering wheel controls C2999-1, circuit VLN04 (VT/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to B3.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

B3 CHECK CIRCUIT VLN04 (VT/GY) FOR AN OPEN TO THE CLOCKSPRING

- Disconnect: Clockspring C218a
- With the parking lamps on, rotate the instrument panel dimmer switch to the full illumination position.

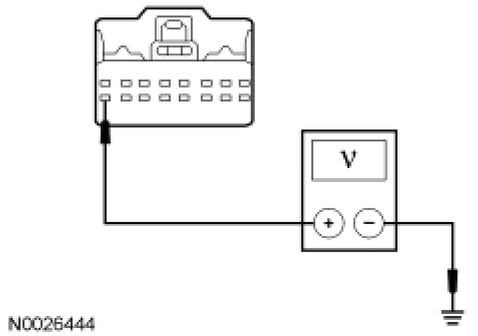

Fig. 4: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the clockspring C218a-16, circuit VLN04 (VT/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

B4 CHECK CIRCUIT GD165 (BK) FOR AN OPEN

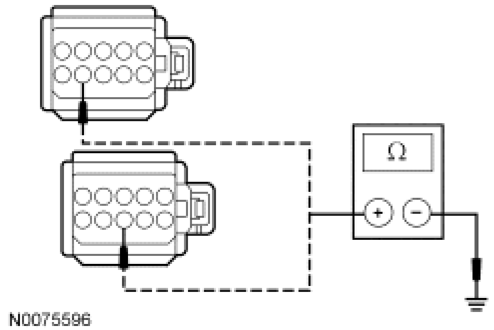

Fig. 5: Checking Circuit GD165 (BK) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the speed control switch C2998-4, circuit GD165 (BK), harness side and ground; and between the audio steering wheel controls C2999-3, circuit GD165 (BK), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new speed control switch or audio steering wheel controls as necessary. REFER to **SPEED CONTROL** article (speed control switch) or **INFORMATION AND ENTERTAINMENT SYSTEMS** article (audio steering wheel controls). TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test C: One Or More (But Not All) Individual Dimmable Illumination Sources Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a pulse-width modulated (PWM) voltage to the dimmable components through circuits VLN04 (VT/GY) and CLN04 (BU/BN) (Fusion, Milan only). Ground for the illumination sources is supplied through circuit GD116 (BK/VT), GD126 (BK/WH), or GD139 (BK/YE).

The window adjust and door lock control switches are only dimmable for MKZ. To diagnose an inoperative window adjust or door lock control switch illumination for Fusion or Milan, go to **Pinpoint Test G**.

- DTC B2026 (Incandescent Backlighting Output Circuit Failure) - sets when the SJB detects a short to ground on the floor shifter or clock circuit. Only Fusion and Milan set this DTC, as the floor shifter and clock for MKZ receive voltage through the LED illumination circuit. This DTC only sets as a continuous DTC.
- DTC B2027 (LED Backlighting Output Circuit Failure) - sets when a short to ground is detected on circuit VLN04 (VT/GY). This DTC only sets as a continuous DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Illumination source

PINPOINT TEST C: ONE OR MORE (BUT NOT ALL) INDIVIDUAL DIMMABLE ILLUMINATION SOURCES ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE VOLTAGE TO THE INOPERATIVE ILLUMINATION SOURCE

- Key in OFF position.

- Disconnect: Inoperative Illumination Source
- With the parking lamps on, rotate the instrument panel dimmer switch to the full illumination position.
- Measure the voltage between the inoperative illumination source, harness side and ground as follows:

Component	Connector-Pin	Circuit
Floor shifter (Fusion, Milan)	C3245-3	CLN04 (BU/BN)
Floor shifter (MKZ)	C3245-3	VLN04 (VT/GY)
Heating ventilation air conditioning (HVAC) module - electronic manual temperature control (EMTC)	C2357a-2	VLN04 (VT/GY)
Memory set switch	C503-3	VLN04 (VT/GY)
Headlamp switch	C205-5	VLN04 (VT/GY)
Clock (Fusion, Milan)	C2016-2	CLN04 (BU/BN)
Clock (MKZ)	C2016-2	VLN04 (VT/GY)
Message center switch	C253-1	VLN04 (VT/GY)
Hazard/passenger air bag disable/traction switch	C2355-6	VLN04 (VT/GY)
Deck lid release switch	C2269-3	VLN04 (VT/GY)
LH front window adjust switch (MKZ)	C535a-6	VLN04 (VT/GY)
RH front window adjust switch (MKZ)	C624-1	VLN04 (VT/GY)
LH rear window adjust switch (MKZ)	C701-4	VLN04 (VT/GY)

RH rear window adjust switch (MKZ)	C819-4	VLN04 (VT/GY)
LH door lock control switch	C505-2	VLN04 (VT/GY)
RH door lock control switch	C605-2	VLN04 (VT/GY)

- **Is the voltage greater than 10 volts?**

  YES : For the LH or RH rear window adjust switch, INSTALL a new switch for the inoperative component. TEST the system for normal operation.

  For all other components, go to C2.

  NO : REPAIR the circuit for an open or short to ground. CLEAR any DTCs. TEST the system for normal operation.

C2 CHECK THE ILLUMINATION SOURCE GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the inoperative illumination source, harness side and ground as follows:

Component	Connector-Pin	Circuit
Floor shifter	C3245-4	GD116 (BK/VT)
HVAC module-EMTC	C2357a-1	GD116 (BK/VT)
Memory set switch	C503-7	GD126 (BK/WH)
Headlamp switch	C205-10	GD116 (BK/VT)
Clock	C2016-5	GD116 (BK/VT)
Message center switch	C253-4	GD116 (BK/VT)
Hazard/passenger air bag disable/traction switch	C2355-1	GD116 (BK/VT)
Deck lid release switch	C2269-2	GD116 (BK/VT)
LH front window adjust switch	C535b-6	GD126 (BK/WH)
RH front window	C624-6	GD139

adjust switch		(BK/YE)
LH door lock control switch	C505- 4	GD126 (BK/WH)
RH door lock control switch	C605-4	GD139 (BK/YE)

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new component for the inoperative component. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test D: The Control Illumination Is Always On - All Hardwired Illumination

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

With the parking lamps or headlamps on, the smart junction box (SJB) supplies a pulse width modulated (PWM) voltage signal to the dimmable illumination sources on circuit VLN04 (VT/GY) or CLN04 (BU/BN) (Fusion, Milan only).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST D: THE CONTROL ILLUMINATION IS ALWAYS ON - ALL HARDWIRED ILLUMINATION

D1 CHECK THE EXTERIOR LIGHTING

- Key in OFF position.
- Make sure the headlamp switch is in the OFF position.
- Observe the exterior lighting components.
- **Are any exterior lighting components illuminated?**

  YES : REFER to **EXTERIOR LIGHTING** article.

  NO : Go to D2.

D2 CHECK CIRCUIT VLN04 (VT/GY) OR CLN04 (BU/BN) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280d
- Key in ON position.
- **Do the dimmable hardwired illumination components continue to illuminate?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to D3.

D3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: All Control Illumination Sources Do Not Dim

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps or the headlamps are on, the smart junction box (SJB) sends a reference voltage signal to the instrument panel dimmer switch on circuit VLN18 (BU/WH), which is grounded by the SJB through circuit CLN27 (WH/BN). The SJB uses the reference voltage to determine the intensity of the back lighting desired by the operator.

For hardwired dimmable illumination sources, the SJB sends a pulse-width modulated (PWM) voltage on circuit VLN04 (VT/GY) and CLN04 (BU/BN) (Fusion, Milan only) based on the input received from the instrument panel dimmer switch.

For network controlled illumination sources, the SJB sends a message via the medium speed controller area network (MS-CAN). If the module receiving the back lighting message either does not receive the message or receives invalid data for greater than 5 seconds, the module defaults to full nighttime intensity. Full nighttime intensity is equivalent to the illumination level when the parking lamps are on, and the instrument panel dimmer switch is in the highest setting.

- DTC B1247 (Panel Dim Switch Circuit Open) - sets when the reference voltage to the instrument panel dimmer switch exceeds the maximum allowable value. This can be caused by an open or short to voltage on circuit VLN18 (BU/WH). This DTC only sets as a continuous DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch

- SJB

PINPOINT TEST E: ALL CONTROL ILLUMINATION SOURCES DO NOT DIM

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB dimmer switch status (DSWSTAT) PID while rotating the instrument panel dimmer switch from the lowest setting to the highest setting.
- Monitor the SJB DSWSTAT PID while rotating the instrument panel dimmer switch to the COURTESY LAMPS ON position.
- **Does the DSWSTAT PID indicate the switch is operating correctly?**

  YES : Go to E5.

  NO : If the PID indicates correctly in the COURTESY LAMPS ON position only, go to E2.

  If the PID indicates incorrectly in all positions, REPAIR circuit CLN27 (WH/BN) for an open. CLEAR the DTCs. TEST the system for normal operation.

  If the system still does not operate correctly, go to E5.

E2 CHECK CIRCUIT VLN18 (BU/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280d
- Disconnect: Instrument Panel Dimmer Switch C2065

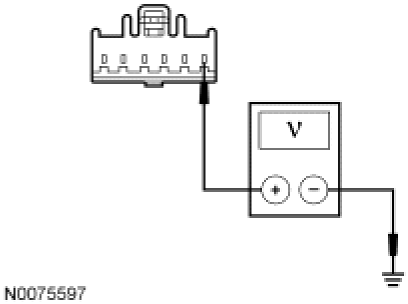

Fig. 6: Checking Circuit VLN18 (BU/WH) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument panel dimmer switch C2065-1, circuit VLN18 (BU/WH), harness side and ground.
- **Is there any voltage indicated?**

YES : REPAIR the circuit. TEST the system for normal operation.

NO : Go to E3.

E3 CHECK CIRCUIT VLN18 (BU/WH) FOR AN OPEN OR SHORT TO GROUND

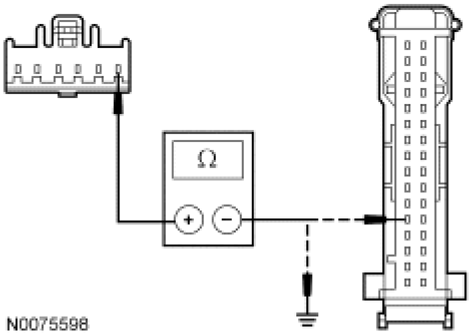

Fig. 7: Checking Circuit VLN18 (BU/WH) For An Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument panel dimmer switch C2065-1, circuit VLN18 (BU/WH), harness side and the SJB C2280d-12, circuit VLN18 (BU/WH); and between the instrument panel dimmer switch C2065-1, circuit VLN18 (BU/WH), harness side and ground.
- **Is the resistance less than 5 ohms between the instrument panel dimmer switch and the SJB, and greater than 10,000 ohms between the instrument panel dimmer switch and ground?**

  YES : Go to E4.

  NO : REPAIR the circuit. TEST the system for normal operation.

E4 CHECK THE INSTRUMENT PANEL DIMMER SWITCH

- Carry out the component test for the instrument panel dimmer switch. Refer to COMPONENT TESTING.
- **Is the instrument panel dimmer switch OK?**

  YES : Go to E5.

  NO : INSTALL a new instrument panel dimmer switch. REFER to **Instrument Panel Dimmer Switch**. TEST the system for normal operation.

E5 CHECK FOR CORRECT SJB OPERATION

- Connect: Instrument Panel Dimmer Switch C2065
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES**

article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Control Illumination Is Inoperative - All Non-Dimmable Illumination

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the accessory delay relay is energized, voltage is supplied from the smart junction box (SJB) to the door lock control switches (Fusion, Milan), the roof opening panel (if equipped) and the cigar lighter (MKZ) through circuit CBP02 (GN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST F: THE CONTROL ILLUMINATION IS INOPERATIVE - ALL NON-DIMMABLE ILLUMINATION

F1 CHECK THE ACCESSORY DELAY RELAY OPERATION

- Key in ON position.
- Close all the vehicle doors.
- Operate the audio system in radio tuner (AM/FM) mode.
- Key in OFF position.
- Observe the audio system operation.
- **Does the audio system continue to operate with the key in OFF and all the doors closed?**

  YES : REPAIR circuit CBP02 (GN) for an open. TEST the system for normal operation.

  NO : VERIFY the SJB fuse 12 (7.5A) is OK. If OK, go to F2. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

F2 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: One Or More (But Not All) Non-Dimmable Illumination Sources Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the delayed accessory relay is energized, voltage is supplied from the smart junction box (SJB) to the door lock control switches (Fusion, Milan), the roof opening panel control switch (if equipped) and the cigar lighter (MKZ) through circuit CBP02 (GN). The LH door lock control switch is grounded through circuit GD126 (BK/WH). The RH door lock control switch is grounded through circuit GD139 (BK/YE). The cigar lighter is grounded through circuit GD115 (BK/GY). The roof opening panel control switch is grounded through circuit CPR39 (VT/WH) to the roof opening panel module, which is grounded through circuit GD139 (BK/YE).

All of the non-dimmable illumination source bulbs share an internal ground within their respective component. For example, the cigar lighter bulb is spliced internally to the lighter element, and they share a common ground path. Because of this characteristic, a concern in the ground circuit to any non-dimmable illumination source will cause both the illumination bulb and the component, itself, to be inoperative. Refer to the appropriate part if the entire component is inoperative.

For the passenger window switches (Fusion, Milan), the illumination power is provided through the passenger window lock-out switch in the LF window control switch on circuit CPW14 (VT/WH). The lock-out switch must be off in order for the passenger window switches to illuminate. Circuit CPW14 (VT/WH) also provides voltage to the passenger window motors. Therefore, if there is a fault in CPW14 (VT/WH), all of the passenger windows will be inoperative. If an individual passenger window switch illumination is inoperative, but the power windows themselves operate correctly, the cause of the concern is the inoperative passenger window switch. Otherwise, refer to **GLASS, FRAMES AND MECHANISMS** article to diagnose the power windows.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Illumination source
- SJB

PINPOINT TEST G: ONE OR MORE (BUT NOT ALL) NON-DIMMABLE ILLUMINATION SOURCES ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

G1 CHECK CIRCUIT CBP02 (GN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Inoperable Illumination Source
- Key in ON position.
- Measure the voltage between the inoperative illumination source, harness side and ground as follows:

Component	Connector-Pin	Circuit
LH door lock control switch (Fusion, Milan)	C505-2	CBP02 (GN)
RH door lock control switch (Fusion, Milan)	C605-2	CBP02 (GN)
Cigar lighter	C370-B	CBP02 (GN)
Roof opening panel control switch	C912-1	CBP02 (GN)

- **Is the voltage greater than 10 volts?**

  YES : For a door lock control switch concern, INSTALL a new door lock control switch for the inoperative switch. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. TEST the system for normal operation.

  For a roof panel opening control switch concern, INSTALL a new roof panel opening control switch. REFER to **ROOF OPENING PANEL** article. TEST the system for normal operation.

  For a cigar lighter concern, go to G2.

  NO : Go to G3.

G2 CHECK CIRCUIT GD115 (BK/GY) FOR AN OPEN

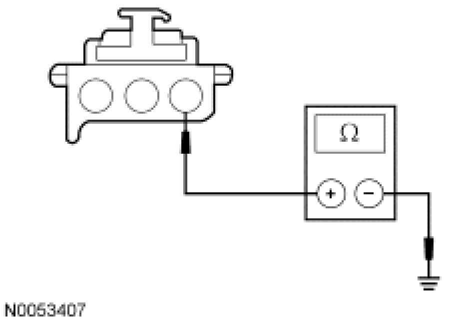

Fig. 8: Checking Circuit GD115 (BK/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the cigar lighter C370-C, circuit GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : INSTALL a new cigar lighter. TEST the system for normal operation.

NO : REPAIR the circuit. TEST the system for normal operation.

G3 CHECK CIRCUIT CBP02 (GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280e
- Measure the resistance between the SJB connector, circuit CBP02 (GN), harness side and the inoperative illumination source, harness side as follows:

Component	SJB Connector-Pin	Inoperative Component Connector-Pin	Circuit
LH door lock control switch (Fusion, Milan)	C2280e-25	C505-2	CBP02 (GN)
RH door lock control switch (Fusion, Milan)	C2280e-25	C605-2	CBP02 (GN)
Cigar lighter	C2280b-28	C370-B	CBP02 (GN)
Roof opening panel switch	C2280e-25	C912-1	CBP02 (GN)

- **Is the resistance less than 5 ohms?**

  YES : Go to G4.

  NO : REPAIR the circuit. TEST the system for normal operation.

G4 CHECK FOR CORRECT SJB OPERATION

- Connect: Inoperable Illumination Source
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

REMOVAL AND INSTALLATION

INSTRUMENT PANEL DIMMER SWITCH

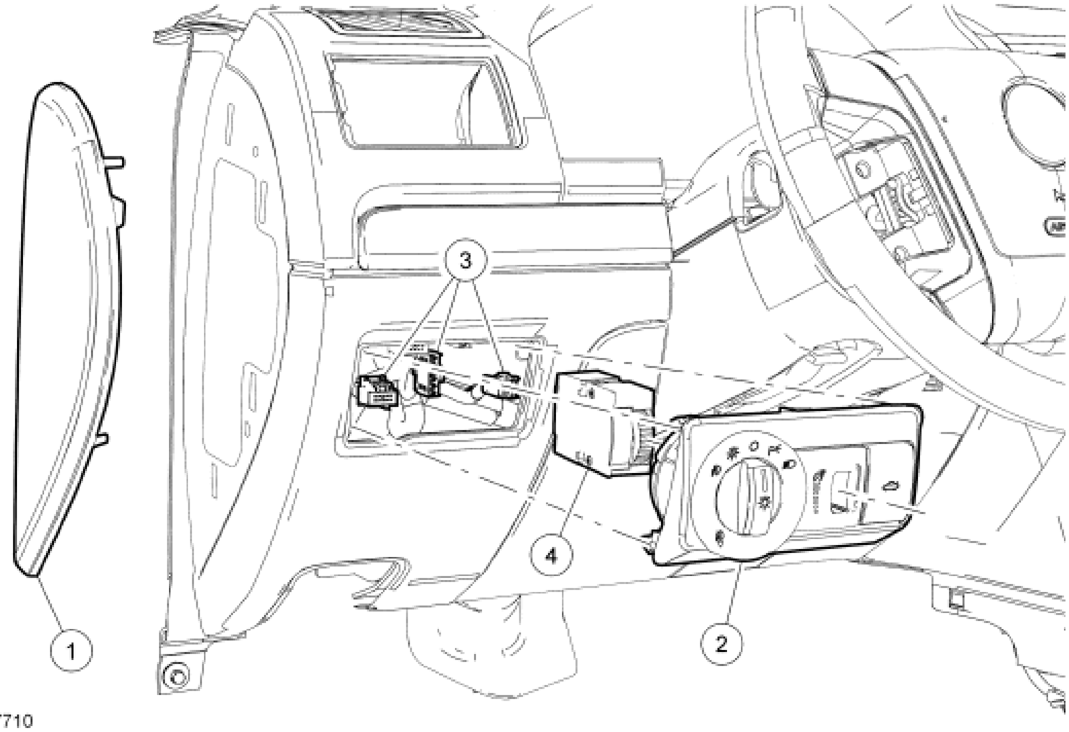

Fig. 9: Exploded View Of Instrument Panel Dimmer Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5404481	Instrument panel side finish panel
2	14K147	Headlamp switch assembly
3	-	Headlamp switch assembly electrical connectors (part of 14401)
4	11691	Instrument panel dimmer switch

REMOVAL AND INSTALLATION

1. Remove the instrument panel side finish panel.

NOTE: The switch is removed by pushing from behind.

2. Release the tabs and remove the headlamp switch assembly.
   - Disconnect the electrical connectors.
3. Release the 4 tabs and remove the instrument panel dimmer switch.

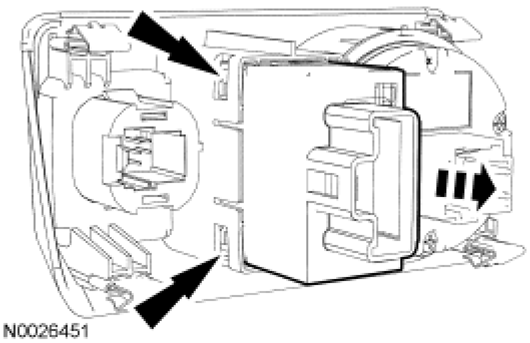

Fig. 10: Releasing Tabs & Removing Instrument Panel Dimmer Switch
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Instrument Cluster (IC), Message Center, & Warning Chimes - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

INSTRUMENT CLUSTER (IC)

The instrument cluster (IC) is available with either a vacuum florescent display (base cluster) or with a message center cluster. Both the base cluster and the message center cluster contain gauges, indicator lamps, and warning lamps that are designed to provide the driver with a system status and to alert the driver that certain conditions exist in the vehicle.

Gauges provide information to the driver indicating the status of systems. Examples of systems that use gauges include vehicle speed, fuel level, engine coolant temperature, and engine rpm. Indicator lamps provide information to the driver of conditions that exist in the vehicle. Examples of the indicator lamps include the turn signal, speed control, and high beams on. Warning indicator lamps provide information to the driver of conditions that could potentially alter vehicle performance. Examples of the warning indicators include the ABS, BRAKE, safety belt, and low oil pressure. The instrument cluster (IC) lens and mask assembly are the only parts that may be installed separately.

INFORMATION AND MESSAGE CENTER

The message center is a fixed format display, integrated into the instrument cluster (IC). The message center functions are controlled by the message center switches. The message center displays important vehicle information by constantly monitoring different vehicle systems. The message center informs the driver of vehicle operations and notifies the driver of potential vehicle problems by displaying a warning message pertaining to the system in which a fault has been detected.

The message center provides a compass display and uses directional information sent from a compass module, located on the underside of the inside rear view mirror (early build) or integrated into the interior rear view mirror (late build).

The message center provides the following features:

- Information displays
- Setup displays
- System check messages
- System warning messages

The message center information is selected through a set of 3 buttons:

- INFO
- SETUP
- RESET

Information Displays (INFO button)

The information displays are non-timed modes. The selected mode remains on until the driver presses a message center button to change the mode or it is overridden by another mode. The information display modes are:

- Odometer
- Trip odometer A or B
- Distance to empty (DTE)
- Average fuel economy
- Average speed
- Compass (if equipped)
- Trip elapsed drive time

Setup Displays (SETUP button)

The setup displays are timed modes and terminate after a finite interval. The setup display modes are:

- System check

NOTE: Pressing the message center switch SETUP button, the message center displays the current units to be displayed. Refer to the Owner's Literature for more information.

- Units (English/metric)
- Language

System Check Displays (RESET button)

By pressing the RESET button on the message center switch, the message center cycles through each of the system check displays being monitored. For each of the monitored systems, the message center indicates either an OK message or a warning message for 2-4 seconds.

The system check displays are:

- ALL DOORS CLOSED
- ENGINE TEMPERATURE
- OIL PRESSURE
- BRAKE FLUID LEVEL
- EXTERIOR LAMPS
- FUEL LEVEL
- DISTANCE TO EMPTY (DTE)

System Warning Messages

System warnings alert the operator to possible problems or malfunctions in the vehicle operating system. When multiple warnings are displayed, the message center cycles all the warnings by displaying each one for several seconds.

The message center displays the last selected feature if there are no more warning messages. This allows full functionality of the message center by pressing the message center switch RESET button to clear the warning message. Warning messages that have been reset are divided into 3 categories where the message:

- does not disappear until a condition has changed.
- will reappear 10 minutes after pressing the RESET button.
- does not reappear until the ignition switch LOCK/OFF to RUN cycle has been completed. This acts as a reminder that the warning conditions still exist on the vehicle.

The system warning messages that cannot be reset are:

- DRIVER DOOR AJAR
- PASSENGER DOOR AJAR
- REAR LEFT DOOR AJAR
- REAR RIGHT DOOR AJAR
- PARK BRAKE ENGAGED

The system warning messages that return after 10 minutes are:

- LOW FUEL LEVEL
- CHECK CHARGING SYSTEM
- CHECK BRAKE SYSTEM

The system warning messages that return after the ignition switch is turned from the LOCK/OFF to RUN position are:

- CHECK PARK AID (if equipped)
- LOW BRAKE FLUID LEVEL
- LOW TIRE PRESSURE
- TIRE PRESSURE MONITOR FAULT
- TIRE PRESSURE SENSOR FAULT
- TRUNK AJAR
- REMOVE OBJECTS NEAR PASS SEAT
- COMPASS ERROR (if equipped)
- CHECK LEFT HEADLAMP
- CHECK RIGHT HEADLAMP
- CHECK LF TURN LAMP
- CHECK RF TURN LAMP

- CHECK LR TURN LAMP
- CHECK RR TURN LAMP
- INTEGRATED KEY PROGRAMMING STATUS (displayed when an attempt is made to program a fifth integrated key to the remote keyless entry (RKE) system) - only allows 4 integrated keys.

WARNING CHIMES

The warning chime sounds to remind the driver:

- to turn the headlamps off when exiting the vehicle.
- to remove the ignition key when exiting the vehicle.
- to close the doors after starting the vehicle.
- to fasten the safety belt after starting the vehicle.
- to turn off the turn signal.
- to disengage the parking brake.
- that a fault is present in the airbag warning indicator circuit.

The instrument cluster (IC) controls the warning chime function using various inputs to determine when to sound the warning chime. The warning chime sounds if:

- the headlamps are on with the key removed from the ignition lock cylinder and the driver door ajar.
- the key is in the ignition lock cylinder in the OFF or ACC position and the driver door ajar.
- a door is ajar and the ignition key is in the ON position.
- the safety belts are not fastened and the ignition key is in the ON position.
- the turn signal is on for more than 3.2 km (2.0 miles).
- the parking brake is engaged and the vehicle is moving at a speed higher than 5 km/h (3 mph).
- the ignition switch is in the ON position, the air bag warning indicator is faulted, and an air bag warning chime request is received from the restraints control module (RCM).

Audible signals are also provided to confirm operation of the following vehicle systems:

- Turn signal
- Hazard signal

DIAGNOSTIC TESTS

INSTRUMENT CLUSTER (IC), MESSAGE CENTER AND WARNING CHIMES

Special Tools

Illustration	Tool Name	Tool Number

 ST1132-A	Instrument Gauge System Tester	014-R1063 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The base and message center instrument clusters (ICs) are configurable, electronic clusters that contain a microprocessor, gauges, indicator lamps, and internal circuitry. Data is sent to the instrument cluster (IC) over the high speed controller area network (HS-CAN), the medium speed controller area network (MS-CAN) and through hardwired circuitry from individual components. The instrument cluster (IC) uses each input to output an action to the gauges or indicators. For additional information regarding the communication network, refer to **MODULE COMMUNICATIONS NETWORK** article.

The instrument cluster (IC), message center and warning chimes use input messages from other modules to control the gauges, informational indicators, and warning indicators over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the brake system status message is missing for less than 5 seconds and the brake warning indicator was ON, the indicator remains in the ON state until the next good message is received. If the message remains missing or invalid for more than 5 seconds, the instrument cluster (IC) sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located before each individual pinpoint test for a further description of the default action specific to each indicator or gauge. If the messaged input to the cluster returns at any time, the normal function of the gauge or indicator resumes.

NOTE: **Whenever a network message is suspected as missing and confirmed by a missing message DTC (U-code), it is important to look for other symptoms that may also be present in the instrument cluster (IC) and throughout the vehicle. Once a DTC is set in the instrument cluster (IC), it may be helpful to review the complete message list available in MODULE COMMUNICATIONS NETWORK article to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.**

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input control the output of the feature, or does it output a message over the communication network to another module.
- which module controls the output of the feature.

Instrument Cluster

Instrument Cluster (IC) Gateway Function

The instrument cluster (IC) acts as a gateway module by receiving information in one format and transmitting it to other modules using another format. For example, the instrument cluster (IC) receives the vehicle speed data from the PCM over the HS-CAN, converts the data into a MS-CAN message and sends (gateways) the message to other network modules such as the heating ventilation air conditioning (HVAC) module, the audio control module (ACM), the parking aid module (PAM), the restraints control module (RCM) and the SJB. This enables network communication between modules that do not communicate using the same network (HS-CAN or the MS-CAN).

Instrument Cluster (IC) Configuration

The instrument cluster (IC) contains items that are configurable. While some configurable items are customer preference items, most items are configured at the end of the line production and are only available for configuration using programmable module installation (PMI) procedures. Refer to **MODULE CONFIGURATION** article for additional information on the PMI procedure.

The Belt-Minder® is the only configurable customer preference item.

Instrument Cluster (IC) Prove-Out

The instrument cluster (IC) and other vehicle modules carry out a display prove-out to verify that all module controlled warning/indicator lamps and monitored systems are functioning correctly within the instrument cluster (IC). The instrument cluster (IC) and other modules such as the restraints control module (RCM) provide

a timed prove-out while other indicators illuminate until engine start up. When the ignition switch is cycled to the ON position with the engine off, the indicators illuminate to prove-out according to the following table:

Indicator	Indicator Type	Prove-Out Duration
ABS	Warning	3 seconds
Air bag	Warning	6 seconds on/2 seconds off
Anti-theft	Indicator	Approx. 3 seconds
Brake	Warning	3 seconds
Charging system	Warning	Engine startup
Check fuel cap	Informational	3 seconds
Door ajar	Warning	None
High beam	Informational	None
Low fuel	Informational	3 seconds
Low oil pressure	Warning	Engine startup
Malfunction indicator lamp (MIL)	Warning	Engine startup
Safety belt	Warning	70 seconds or until the safety belt is fastened
Speed control	Informational	None
Tire pressure monitoring system (TPMS)	Warning	3 seconds
Traction assist	Warning	3 seconds
Powertrain malfunction (wrench)	Informational	3 seconds
RH/LH turn	Informational	None

Information And Message Center

The message center is an integral part of the instrument cluster (IC) that receives and acts upon much of the same information that is input and used to operate the instrument cluster (IC) gauges, informational indicators, and warning indicators. The message center, located in the center of the instrument cluster (IC), is a 2 line display. The message center electronic functions use both hardwired, and the controller area network (CAN) circuitry to transmit and receive information.

Whenever conditions are present that require a warning message, the message center replaces the last selected display with the new warning display. Once the message is reset or cleared, the message center returns to the last selected display. If multiple warning messages are present, the message center displays each warning for approximately 4 seconds. Warning messages are also generally associated with other observable instrument cluster (IC) indications. For example, when the LH front door is opened, the message center displays the message DRIVER DOOR AJAR along with the door ajar warning indicator. This allows the message center to be a more informative supplement to the instrument cluster (IC) gauges and indicators.

Warning Chimes

The instrument cluster (IC) uses inputs that are both hardwired to individual components and messages that are sent from the other modules over the high speed or medium speed controller area networks (HS-CAN or MS-CAN) to control the warning chime functions.

Warning Chime Characteristics

Each warning chime has unique characteristics that help to identify and differentiate each warning chime. The warning chimes use volume, chime frequency, length of time the chime sounds and the number of chime tones to identify which chime is sounding. The instrument cluster (IC) prioritizes the chimes according to a preset hierarchy programmed into the instrument cluster (IC) software. Generally, when more than one chime request is received by the instrument cluster (IC), the most important chime sounds. If a lower priority chime is currently sounding, the higher priority request takes over and replaces the lower priority chime.

There are 3 different chimes as listed below:

- Repetitive
- Single tone
- Tic-tock

The following list provides a summary of the chimes and each chimes type/characteristics.

- Safety belt warning (repetitive chime)
- Belt-Minder® warning (repetitive chime after a delay and after the safety belt chime is completed)
- Key-in-ignition warning (repetitive chime)
- Headlamps on warning (repetitive chime)
- Door ajar warning (single tone chime)
- Turn signal left on warning (repetitive chime after 3.2 km [2.0 miles])
- Turn signal tone (tic-tock chime)
- Parking brake warning (repetitive chime)
- Air bag secondary warning chime (repetitive chime)
- Low fuel level warning chime (single tone chime)

Safety Belt Warning Chime

The safety belt warning chime warns that the safety belt is not fastened. The safety belt warning chime sounds when the driver or passenger safety belt is not fastened and the ignition lock cylinder is turned from the OFF/LOCK or ACC to the ON or START position.

The safety belt warning chime stops sounding when the safety belt is fastened, when the ignition lock cylinder is turned from the ON or START position to the OFF/LOCK or ACC position, or when the chime has sounded for approximately 6 seconds.

The safety belt warning chime inputs are the:

- Ignition switch RUN/START position
- Driver or passenger safety belt switch data communicated by the restraints control module (RCM) to the instrument cluster (IC) through the controller area network (CAN)

Belt-Minder®

The Belt-Minder® is configurable. Refer to **MODULE CONFIGURATION** article. To configure without using a scan tool, refer to **Belt-Minder® Deactivating/Activating**.

NOTE: The Belt-Minder® is disabled for one ignition switch cycle if the safety belt is buckled then unbuckled during that specific cycle.

The Belt-Minder® feature supplements the current safety belt warning function. The Belt-Minder® is enabled after the current safety belt warning is complete. The Belt-Minder® reminds the driver that the driver or passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster (IC) once the vehicle speed has exceeded 5 km/h (3 mph), and remains active for 5 minutes from the time it is started. While activated, the Belt-Minder® alternates the chime and indicator from on for 6 seconds to off for 30 seconds.

Key-In-Ignition Warning Chime

The key-in-ignition warning chime warns that the key is still in the ignition lock cylinder when the driver door is ajar. The key-in-ignition warning chime sounds when the driver door is ajar, the key is in the ignition lock cylinder and in the OFF/LOCK or ACC position.

The key-in-ignition warning chime stops sounding when the driver door is closed, the key is removed from the ignition lock cylinder, or if the ignition lock cylinder is turned to the ON position.

The key-in-ignition warning chime inputs are the:

- Ignition switch RUN/START position
- Door ajar data communicated by the SJB to the instrument cluster (IC) through the CAN
- Key-in-ignition switch signal from the ignition switch

Headlamps On Warning Chime

The headlamps on warning chime warns that the headlamps are on when the driver door is ajar and the key is removed from the ignition lock cylinder. The headlamps on warning chime sounds if the driver door is ajar, the headlamp switch is in the PARKING LAMP or HEADLAMP position, and the ignition lock cylinder is in the OFF/LOCK position with the key out.

The headlamps on warning chime stops sounding when any one of the above conditions are removed.

The headlamps on warning chime inputs are the:

- Ignition switch position
- Key-in-ignition switch position
- Driver door ajar data communicated by the SJB to the instrument cluster (IC) through the CAN
- Headlamp switch data communicated by the SJB to the instrument cluster (IC) through the CAN

Door Ajar Warning Chime

The door ajar warning chime warns that a door is not fully closed. The chime sounds when any door, or the luggage compartment lid becomes ajar while the ignition lock cylinder is in the ON position.

The door ajar warning chime stops sounding when all the doors and the luggage compartment lid are closed, or the ignition lock cylinder is turned to the OFF/LOCK or ACC position.

The door ajar warning lamp/chime inputs are the:

- Ignition switch RUN/START position
- Door ajar data communicated by the SJB to the instrument cluster (IC) through the CAN

Turn Signal Left On Reminder Chime

The turn signal left on reminder chime warns that the turn signal has not been cancelled. The turn signal left on reminder chime sounds if the left or right turn signal is on and the vehicle has traveled more than 3.2 km (2.0 miles).

The turn signal left on reminder chime stops sounding if the turn signal is turned off, or if the ignition lock cylinder is turned to the OFF or ACC position.

The turn signal left on reminder chime inputs are the:

- Turn signal data communicated by the SJB to the instrument cluster (IC) through the CAN communication
- Odometer count data communicated by the PCM to the instrument cluster (IC) through the CAN

Parking Brake Warning Chime

The parking brake warning chime warns that the parking brake is engaged when the vehicle is in motion. The parking brake warning chime sounds if the ignition lock cylinder is in the ON position, the parking brake is engaged, and the vehicle speed is greater than 5 km/h (3 mph).

The parking brake warning chime stops sounding if the parking brake is released, the ignition lock cylinder is not in the ON position, if the vehicle speed is less than 5 km/h (3 mph), or after 90 seconds from the time the chime is activated.

The parking brake warning chime inputs are the:

- Ignition switch RUN/START position
- Parking brake switch data communicated by the SJB to the instrument cluster (IC) through the CAN
- Vehicle speed data communicated by the PCM to the instrument cluster (IC) through the CAN

Air Bag Secondary Warning Chime

The air bag secondary warning chime warns that the air bag warning indicator light does not work correctly. The instrument cluster (IC) monitors the air bag warning indicator status internally. When a fault is present in the air bag warning indicator and the instrument cluster (IC) receives an air bag warning indicator on request

from the restraints control module (RCM), the air bag secondary warning chime sounds.

The air bag secondary warning chime inputs are the:

- Ignition switch RUN/START position
- Air bag warning indicator request data is communicated by the RCM to the instrument cluster (IC)

Turn/Hazard On Tone

The turn/hazard on tone provides an audible signal in addition to the turn/hazard indicator lamps. The turn/hazard on tone sounds if the turn or hazard signals are on.

The turn/hazard on tone inputs are the:

- Left turn indicator signal from the SJB to the instrument cluster (IC)
- Right turn indicator signal from the SJB to the instrument cluster (IC)

Low Fuel Level Warning Chime

The low fuel level warning chime provides a supplemental alert to inform the driver that the fuel level is low. The LOW FUEL LEVEL warning message displays in the message center and the low fuel level warning chime sounds simultaneously when the fuel level reaches approximately 1/8 tank and the distance to empty is 80 km (50 miles) or below.

The low fuel level warning chime inputs are the:

- Ignition switch RUN/START position
- Fuel level input from the fuel level sensor

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Accessory drive belt • Brake fluid level • Door adjustment • Engine coolant level • Engine oil level • Fuel evaporative system	• Smart junction box (SJB) fuse(s): ○ 13 (7.5A) ○ 23 (7.5A) ○ 27 (7.5A) ○ 28 (10A) • Wiring, terminals or connectors

• Fuel tank • Tire pressure • Luggage compartment lid adjustment	• Message center switches • Key-in-ignition warning switch (part of the ignition switch) • Smart junction box (SJB) • Instrument cluster (IC)

3. If the cause is not visually evident, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs for the instrument cluster (IC), the restraints control module (RCM), the SJB, and the PCM.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster (IC) and the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other module DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart - Instrument Cluster (IC)**, go to **Symptom Chart - Information And Message Center** or Go to **Symptom Chart - Warning Chimes**.

DTC Charts

INSTRUMENT CLUSTER (IC) DTC CHART

DTC	Description	Action
B1137	IKT Data Not Programmed	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1138	IKT Memory Full	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1139	Invalid Transmitter Identification Code	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1202	Fuel Sender Circuit Open (fuel pump module)	If equipped with front wheel drive (FWD), go to **Pinpoint Test B**. If equipped with all wheel drive (AWD), go to **Pinpoint Test C**.
B1204	Fuel Sender Circuit Short to Ground (fuel pump module)	If equipped with front wheel drive (FWD), go to **Pinpoint Test B**. If equipped with all wheel drive (AWD), go to **Pinpoint Test C**.
B1205	EIC Switch-1 Assembly Circuit Failure	Trip/Reset switch failure occurred. VERIFY the trip/reset switch is not binding on the instrument cluster (IC) bezel. If the trip/reset switch is binding on the instrument cluster (IC) bezel, REPAIR the bezel assembly as necessary. CLEAR the DTCs. REPEAT the self-test. If the trip/reset switch is not binding on the instrument cluster (IC) bezel, CLEAR the DTCs. REPEAT the self-test. If DTC B1205 is still present, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
B1209	EIC Switch-2 Assembly Circuit Failure	INSTALL a new message center switch. REFER to **Message Center Switch**. TEST the system for normal operation.
B1213	Anti-Theft Number of Programmed Keys Is Below Minimum	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1317	Battery Voltage High	CLEAR the DTCs. REPEAT the self-test. If DTC B1317 is still present, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.
B1318	Battery Voltage Low	Go to **Pinpoint Test AA**.
B1342	ECU is Faulted	INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
B1352	Ignition Key-In Circuit Failure	Go to **Pinpoint Test AI**.
B1360	Ignition Run/Acc Circuit Open	Go to **Pinpoint Test A**.
B1600	PATS Ignition Key Transponder Signal Is Not Received	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

B1602	PATS Received Invalid Format Of Key-Code From Ignition Key Transponder	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1681	PATS Transceiver Module Signal Is Not Received	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1868	Lamp Air Bag Warning Indicator Circuit Failure	INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
B2103	Antenna Not Connected	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2141	NVM Configuration Failure	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2143	NVM Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B2143 is still present, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
B2207	ECU ROM Checksum Error	CLEAR the DTCs. REPEAT the self-test. If DTC B2207 is still present, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
B2390	Master/Slave Communication Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B2390 is still present, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
B2431	Transponder Programming Failed	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2477	Module Configuration Failure	REFER to **MODULE CONFIGURATION** article.
B2627	Fuel Sender Circuit Open #2 (secondary fuel sender)	Go to **Pinpoint Test C**.
B2628	Fuel Sender Circuit Short to Ground #2 (secondary fuel sender)	Go to **Pinpoint Test C**.
B2844	Ignition Fault	Go to **Pinpoint Test AB**.
B2879	Fuel Tank Jet Pump Fault	Go to **Pinpoint Test C**.
C1093	Traction Control Disable Switch Circuit Failure	REFER to **VEHICLE DYNAMIC SYSTEMS** article.
C2784	RAM Checksum Failure	REPAIR all other DTCs first. CLEAR the DTCs. REPEAT the self-test. If DTC C2784 is still present, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
U0002	High Speed CAN Communication Bus Performance	REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0020	Low Speed CAN Communication Bus	REFER to **MODULE COMMUNICATIONS NETWORK** article.

	Performance	
U1900	CAN Communication Bus Fault	REPAIR all other DTCs first. CLEAR the DTCs. CYCLE the key OFF then ON and wait 10 seconds. REPEAT the self-test. If DTC U1900 is still present, REFER to **MODULE COMMUNICATIONS NETWORK** article.
U1901	CAN Network #2 Communication Bus Fault-Receive Error	REPAIR all other DTCs first. CLEAR the DTCs. CYCLE the key OFF then ON and wait 10 seconds. REPEAT the self-test. If DTC U1901 is still present, REFER to **MODULE COMMUNICATIONS NETWORK** article.
U2013	Compass Module is Not Responding	Go to **Pinpoint Test AE**.
U2023	Fault Received From External Node	U2023 is set when a module receives invalid network data from another module with a faulted input. RETRIEVE and REPAIR all non-network DTCs in the other modules on the network. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for a list of all DTCs.
U2050	No Application Present	REPROGRAM the instrument cluster (IC). If the DTC occurs after REPROGRAMMING, REPROGRAM the instrument cluster (IC) again. If the DTC reappears after each attempt to PROGRAM, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
U2051	One or More Calibration Files Missing/Corrupt	REPROGRAM the instrument cluster (IC). If the DTC occurs after REPROGRAMMING, REPROGRAM the instrument cluster (IC) again. If the DTC reappears after each attempt to PROGRAM, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
U2510	CAN - Invalid Data For Vehicle Security	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
U2511	CAN - Data Mis-Match (Receive Data Does Not Match Expected)	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B2479	Brake Park Switch Circuit Short to Ground	Go to **Pinpoint Test J**.
C1125	Brake Fluid Level Sensor Input Circuit Failure	Go to **Pinpoint Test J**.
C1284	Oil Pressure Switch Failure	Go to **Pinpoint Test S**.

All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

PCM DTC CHART

DTC	Description	Action
P0457	Evaporative Emission System Leak Detected (fuel cap loose/off)	Go to **Pinpoint Test V**.
P0460	Fuel Level Sensor A Circuit	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test B** for front wheel drive (FWD). If sent here from the PC/ED manual, go to **Pinpoint Test C** for wagon or all wheel drive (AWD).
P0461	Fuel Level Sensor A Circuit Range/Performance	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test B** for front wheel drive (FWD). If sent here from the PC/ED manual, go to **Pinpoint Test C** for wagon or all wheel drive (AWD).
P0462	Fuel Level Sensor A Circuit Low	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test B** for front wheel drive (FWD). If sent here from the PC/ED manual, go to **Pinpoint Test C** for wagon or all wheel drive (AWD).
P0463	Fuel Level Sensor A Circuit High	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test B** for front wheel drive (FWD). If sent here from the PC/ED manual, go to **Pinpoint Test C** for wagon or all wheel drive (AWD).
P2065	Fuel Level Sensor B Circuit	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test C**.
P2066	Fuel Level Sensor B Circuit Range/Performance	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test C**.
P2067	Fuel Level Sensor B Circuit Low	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test C**.
P2068	Fuel Level Sensor B Circuit High	REFER to the **Introduction - Gasoline Engines** article first. If sent here from the PC/ED manual, go to **Pinpoint Test C**.
All other DTCs	-	REFER to the **Introduction - Gasoline Engines** article.

Symptom Charts

Symptom Chart - Instrument Cluster (IC)

Condition	Possible Sources	Action
	• Fuse(s)	

• No communication with the instrument cluster (IC)	• Wiring, terminals or connectors • Instrument cluster (IC)	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the smart junction box (SJB)	• Fuse(s) • Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The instrument cluster (IC) is inoperative	• Fuse(s) • Wiring, terminals or connectors • Instrument cluster (IC)	• Go to **Pinpoint Test A**.
• Incorrect fuel gauge indication - front wheel drive (FWD)	• Wiring, terminals or connectors • Fuel pump module assembly • Fuel level sensor (float and card) • Fuel tank • Instrument cluster (IC)	• Go to **Pinpoint Test B**.
• Incorrect fuel gauge indication - all wheel drive (AWD)	• Wiring, terminals or connectors • Fuel pump module assembly • Secondary fuel level sensor • Fuel level sensor (float and card) • Fuel tank • Instrument cluster (IC)	• Go to **Pinpoint Test C**.
• Incorrect temperature gauge indication	• Instrument cluster (IC)	• Go to **Pinpoint Test D**.
• The tachometer is inoperative	• Instrument cluster (IC)	• Go to **Pinpoint Test E**.
• The speedometer/odometer is inoperative	• PCM • Instrument cluster (IC)	• Go to **Pinpoint Test F**.

• Incorrect speedometer indication	• Tire size configuration • Axle ratio configuration • PCM • Instrument cluster (IC)	• Go to **Pinpoint Test G**.
• The low fuel indicator is never/always on (if equipped)	• Instrument cluster (IC)	• Go to **Pinpoint Test H**.
• The brake warning indicator is never on	• Wiring, terminals or connectors • Parking brake warning indicator switch • Brake fluid level switch (part of the brake fluid reservoir) • SJB • Instrument cluster (IC)	• Go to **Pinpoint Test I**.
• The brake warning indicator is always on	• Wiring, terminals or connectors • Parking brake warning indicator switch • Brake fluid level switch (part of the brake fluid reservoir) • Base brake system • SJB • Instrument cluster (IC)	• Go to **Pinpoint Test J**.
• The ABS warning indicator is never/always on	• ABS module • Instrument cluster (IC)	• Go to **Pinpoint Test K**.
• The safety belt warning indicator is never/always on	• Restraints control module (RCM) • Instrument cluster (IC)	• Go to **Pinpoint Test L**.

• The air bag warning indicator is never/always on	• RCM • Instrument cluster (IC)	• Go to **Pinpoint Test M**.
• The tire pressure monitoring system (TPMS) warning indicator is never/always on	• Tire pressure • TPMS concern • SJB • Instrument cluster (IC)	• Go to **Pinpoint Test N**.
• The door ajar warning indicator is never/always on	• Interior lamps concern • SJB • Instrument cluster (IC)	• Go to **Pinpoint Test O**.
• The high beam indicator is never/always on	• SJB • Instrument cluster (IC)	• Go to **Pinpoint Test P**.
• The LH/RH turn signal indicator is never/always on	• SJB • Instrument cluster (IC)	• Go to **Pinpoint Test Q**.
• The anti-theft indicator is never/always on	• Passive anti-theft system (PATS) concern • Instrument cluster (IC)	• Go to **Pinpoint Test R**.
• The anti-theft indicator is never on (does not prove-out)	• Instrument cluster (IC)	• INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The low oil pressure warning indicator is never/always on	• Wiring, terminals or connectors • Oil pressure switch • Base engine concern • SJB • Instrument cluster (IC)	• Go to **Pinpoint Test S**.
• The malfunction indicator lamp (MIL) is never/always on	• PCM • Instrument cluster (IC)	• Go to **Pinpoint Test T**.
	• Transmission	

• The powertrain malfunction (wrench) warning indicator is never/always on	control module (TCM) • PCM • 4X4 control module (if equipped) • Instrument cluster (IC)	• Go to **Pinpoint Test U**.
• The check fuel cap warning indicator is never/always on	• PCM • Instrument cluster (IC)	• Go to **Pinpoint Test V**.
• The speed control indicator is never/always on	• PCM • Instrument cluster (IC)	• Go to **Pinpoint Test W**.
• The traction assist indicator is never/always on	• Traction assist system • PCM • Instrument cluster (IC)	• Go to **Pinpoint Test X**.
• The charging system warning indicator is never/always on	• Charging system concern • PCM • Instrument cluster (IC)	• Go to **Pinpoint Test Y**.
• The O/D OFF indicator is never/always on	• TCM • Instrument cluster (IC)	• Go to **Pinpoint Test Z**.

Symptom Chart - Information And Message Center

Condition	Possible Sources	Action
• The message center is not operating correctly	• Message center switch concern • Instrument cluster (IC)	• Go to **Pinpoint Test AC**.
• The message center switch does not operate correctly	• Wiring, terminals or connectors • Message center switch • Instrument cluster (IC)	• Go to **Pinpoint Test AD**.

• The message center display is blank	• Instrument cluster (IC)	• INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The compass is inoperative	• Fuse • Wiring, terminals or connectors • Compass module	• Go to **Pinpoint Test AE**.
• The COMPASS ERROR message is inoperative	• Fuse • Wiring, terminals or connectors • Compass module (early build) • Auto-dimming interior mirror (late build)	• Go to **Pinpoint Test AE**.
• The compass is inaccurate	• Zone setting • Calibration • Vehicle magnetization • Compass module (early build) • Auto-dimming interior mirror (late build)	• Go to **Pinpoint Test AF**.
• The DRIVER DOOR, PASSENGER DOOR, REAR LEFT DOOR, REAR RIGHT DOOR or TRUNK AJAR warning message is inoperative	• Smart junction box (SJB) • Instrument cluster (IC)	• Go to **Pinpoint Test AG**.
• The LOW FUEL LEVEL warning message is inoperative	• Fuel gauge • Instrument cluster (IC)	• Go to **Pinpoint Test AH**.
		• CHECK the operation of the speedometer, the odometer, and the fuel gauge. • If the speedometer, odometer, or fuel gauge do not operate correctly, go to **Pinpoint Test B** (fuel gauge, front wheel drive [FWD]), go to **Pinpoint**

		Test C (fuel gauge, all wheel drive [AWD]) or Go to **Pinpoint Test F** (speedometer). • If the speedometer, odometer, and fuel gauge operate correctly, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The distance to empty (DTE)/average fuel economy is inoperative	• Instrument cluster (IC)	
• The LOW TIRE PRESSURE, TIRE PRESSURE SENSOR FAULT or TIRE PRESSURE MONITOR FAULT warning message is inoperative/always on	• SJB • Instrument cluster (IC)	• VERIFY that the tire pressure monitoring system (TPMS) warning indicator operates correctly. • If the TPMS reconfigurable telltale indicator does not operate correctly, go to **Pinpoint Test N**. • If the TPMS warning indicator operates correctly, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The CHECK CHARGING SYSTEM warning message is inoperative	• Instrument cluster (IC)	• OBSERVE the charging system warning indicator. • If the charging system warning indicator does not operate correctly, go to **Pinpoint Test Y**. • If the charging system warning indicator operates correctly, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The LOW BRAKE FLUID LEVEL warning message is	• Instrument cluster (IC)	• OBSERVE the BRAKE warning indicator. • If the BRAKE warning indicator does not operate correctly, go to **Pinpoint Test I**. • If the BRAKE warning

inoperative		indicator operates correctly, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

• The CHECK BRAKE SYSTEM warning message is inoperative	• Instrument cluster (IC)	• OBSERVE the BRAKE warning indicator.
		  • If the BRAKE warning indicator does not operate correctly, go to **Pinpoint Test I**.
		  • If the BRAKE warning indicator operates correctly, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

• The PARK BRAKE ENGAGED message is inoperative	• Instrument cluster (IC)	• OBSERVE the BRAKE warning indicator.
		  • If the BRAKE warning indicator does not operate correctly, go to **Pinpoint Test I**.
		  • If the BRAKE warning indicator operates correctly, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

• The CHECK RIGHT HEADLAMP/CHECK LEFT HEADLAMP message is inoperative	• SJB
	• Instrument cluster (IC)
		• OBSERVE the headlamps for correct operation.
		  • If the headlamps do not operate correctly, REFER to **EXTERIOR LIGHTING** article.
		  • If the headlamps operate correctly, INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

• The CHECK LF, RF, LR, and RR TURN LAMP message is inoperative	• SJB
	• Instrument cluster (IC)
		• OBSERVE the turn signals for correct operation.
		  ◦ If the turn signals do not operate correctly, REFER to **EXTERIOR LIGHTING** article.
		  ◦ If the turn signals operate correctly, INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

Symptom Chart - Warning Chimes

Condition	Possible Sources	Action
• No communication with the instrument cluster (IC)	• Fuse(s) • Wiring, terminals or connectors • Instrument cluster (IC)	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• All the chimes are inoperative	• Instrument cluster (IC)	• INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The key-in-ignition warning chime is inoperative	• Wiring, terminals or connectors • Key-in-ignition warning switch (part of the ignition switch) • Instrument cluster (IC)	• Go to **Pinpoint Test AI**.
• The headlamps on warning chime is inoperative	• Instrument cluster (IC)	• Go to **Pinpoint Test AJ**.
• The turn signal left on reminder chime is inoperative	• Instrument cluster (IC)	• Go to **Pinpoint Test AK**.
• The chime sounds when the driver door is ajar (no	• Wiring, terminals or connectors • Key-in-ignition warning switch (part	

key in ignition and headlamps off)	of the ignition switch) • Instrument cluster (IC)	• Go to **Pinpoint Test AL**.
• The safety belt warning chime does not operate correctly	• Instrument cluster (IC)	• Go to **Pinpoint Test AM**.

REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.
• The low fuel level warning chime is inoperative	• Instrument cluster (IC)	• CHECK the operation of the LOW FUEL LEVEL warning message in the message center. • If the LOW FUEL LEVEL warning message is not displayed and the fuel level is at or below 80 km (50 miles), go to **Pinpoint Test AH**. • If the LOW FUEL LEVEL warning message is displayed, INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: The Instrument Cluster (IC) Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for

Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

With the ignition switch in the START or RUN position, the instrument cluster (IC) receives voltage from the smart junction box (SJB) through circuit CBP20 (YE/VT). When the ignition switch is in the RUN or ACC position, voltage is received from the SJB through circuit CBP23 (BN/YE). With the ignition switch in the OFF position, the instrument cluster (IC) receives its keep-alive voltage from the SJB through circuit SBP07 (WH/RD). The instrument cluster (IC) grounding is through circuit GD116 (BK/VT).

- DTC B1360 (Ignition Run/Acc Circuit Open) - is a continuous DTC that sets if the instrument cluster (IC) detects an open on the RUN/ACC input, circuit CBP23 (BN/YE) with voltage applied to the RUN/START input, circuit CBP20 (YE/VT) for more than 15 seconds.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Instrument cluster (IC)

PINPOINT TEST A: THE INSTRUMENT CLUSTER (IC) IS INOPERATIVE

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

A1 CHECK THE INSTRUMENT CLUSTER (IC) VOLTAGE SUPPLY

- Key in OFF position.
- Disconnect: Instrument Cluster (IC) C220
- Key in ON position.

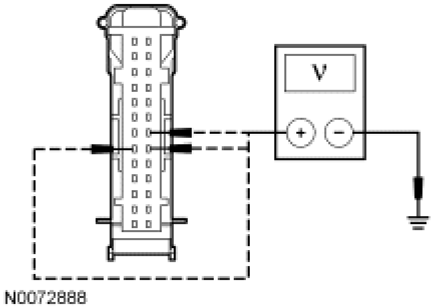

Fig. 1: Checking Instrument Cluster (IC) Voltage Supply
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC), harness side and ground as follows:

Instrument Cluster (IC) Connector-Pin	Circuit
C220-20	CBP20 (YE/VT)
C220-6	CBP23 (BN/YE)
C220-19	SBP07 (WH/RD)

- **Are the voltages greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY the SJB fuses 13 (7.5A), 23 (7.5A), and 27 (7.5A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

A2 CHECK THE INSTRUMENT CLUSTER (IC) GROUND CIRCUITS

- Key in OFF position.

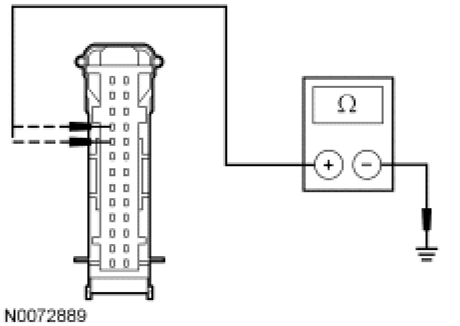

Fig. 2: Checking Instrument Cluster (IC) Ground Circuits
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC), harness side and ground as follows:

Instrument Cluster (IC) Connector-Pin	Circuit
C220-9	GD116 (BK/VT)
C220-10	GD116 (BK/VT)

- **Are the resistances less than 5 ohms?**

YES : Go to A3.

NO : REPAIR the circuit in question. TEST the system for normal operation.

A3 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: Incorrect Fuel Gauge Indication - Front Wheel Drive (FWD)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The fuel pump module assembly receives a reference voltage signal from the instrument cluster (IC) through circuit VMC11 (YE/VT), and returns the fuel level signal to the instrument cluster (IC) through circuit RMC32 (GN/BU). As the fuel level changes, a float actuates a variable resistor that alters the fuel level signal voltage. The instrument cluster (IC) interprets this signal and commands the fuel gauge to sweep to the correct level.

NOTE: The fuel pump module may also be called the fuel tank unit.

The instrument cluster (IC) receives the fuel level signal from the fuel level sensor, part of the fuel pump module. The fuel level sensor measures variable resistance in the fuel tank depending on the current fuel level. When the fuel level is low, the resistance in the unit is high (180 ohms ± 4 ohms). When the fuel level is high, the resistance in the unit is low (10 ohms ± 2 ohms).

The instrument cluster (IC) uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Key OFF fueling
- Key ON fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

Anti-Slosh Mode

The default fuel gauge mode is the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sender readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

Key Off Fueling Mode

The key OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The key must be in the OFF position during the entire refueling of the vehicle.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The instrument cluster (IC) must receive a valid key ON fuel sender reading within 1 second of the key being put into the RUN position. The key ON sample readings are considered valid if the fuel sender reading is between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

Key On Fueling Mode

The key ON fueling mode (approximately 90 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The transaxle is in PARK (P) (automatic transaxle), or the parking brake is applied (manual transaxle).
- The key is in the RUN position.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In key ON fueling mode, a 30-second timer activates after the transaxle is put into the PARK (P) position (automatic transaxle) or when the parking brake is applied (manual transaxle). When the 30-second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 90 seconds to read from empty (E) to full (F). When the transaxle is shifted out of PARK (P) or the parking brake is released, the fuel gauge strategy reverts to the anti-slosh mode. The key ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the key in the RUN position.

Recovery Mode

Recovery mode is incorporated into the instrument cluster (IC) strategy to recover from a missing fuel level input during a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sender or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiated when the following 2 conditions are met:

- The instrument cluster (IC) is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

INSTRUMENT CLUSTER (IC) DTCS

DTC Description	Fault Trigger Conditions
B1202 - Fuel Sender Circuit Open (fuel pump module)	A continuous and on-demand DTC that sets if the instrument cluster (IC) detects that the fuel sender is out of range for 33 seconds on input circuit VMC11 (YE/VT) with an open or short to voltage. The instrument cluster (IC) defaults the fuel gauge to empty (E), once the instrument cluster (IC) detects a fault and sets DTC B1202.
B1204 - Fuel Sender Circuit Short to Ground (fuel pump module)	A continuous and on-demand DTC that sets if the instrument cluster (IC) detects that the fuel sender is out of range for 33 seconds on input circuit VMC11 (YE/VT) with short to ground. The instrument cluster (IC) defaults the fuel gauge to empty (E), once the instrument cluster (IC) detects a fault and sets DTC B1204.

PCM DTCS

DTC Description	Fault Trigger Conditions
P0460 - Fuel Level Sensor A Circuit	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
P0461 - Fuel Level Sensor A Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
P0462 Fuel Level Sensor A Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel pump module signal circuit based on the messaged input received from the instrument cluster (IC).
P0463 Fuel Level Sensor A Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the instrument cluster (IC).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Fuel pump module assembly

- Fuel level sensor (float and card)
- Fuel tank
- Instrument cluster (IC)

PINPOINT TEST B: INCORRECT FUEL GAUGE INDICATION - FRONT WHEEL DRIVE (FWD)

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded instrument cluster (IC) DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

YES : If DTC B1202 is retrieved, go to B3.

If DTC B1204, go to B8.

For all other DTCs, REFER to **DTC Charts**.

NO : Go to B2.

B2 CARRY OUT THE INSTRUMENT CLUSTER (IC) FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL

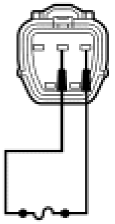
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) fuel gauge (Fuel) active command and command the fuel gauge from 0% to 20%, 50%, 70% and 100% while observing the fuel gauge.
- **Does the fuel gauge begin at (E) empty, move to approximately 1/4, 1/2, 3/4 and F (full)?**

YES : Go to B11.

NO : Go to B14.

B3 CHECK THE FUEL PUMP MODULE FOR AN OPEN

- Key in OFF position.
- Disconnect: Fuel Pump Module C433



N0053609

Fig. 3: Checking Fuel Pump Module For Open
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side and the fuel pump module C433 -2, circuit VMC11 (YE/VT), harness side.
- Key in ON position.
- Wait one minute.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) Self-Test

NOTE: DTC B1202 may also be present when carrying out this step and should be ignored.

- Repeat the instrument cluster (IC) self-test.
- Retrieve the instrument cluster (IC) continuous DTCs.
- **Is DTC B1204 retrieved?**

  YES : REMOVE the jumper wire. Go to B13.

  NO : REMOVE the jumper wire. Go to B4.

B4 CHECK CIRCUIT VMC11 (YE/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Instrument Cluster (IC) C220
- Key in ON position.

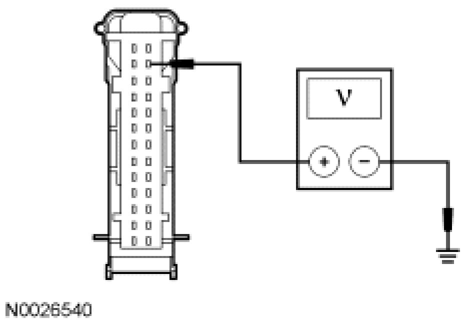


Fig. 4: Checking Circuit VMC11 (YE/VT) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B5.

B5 CHECK CIRCUIT RMC32 (GN/BU) FOR A SHORT TO VOLTAGE

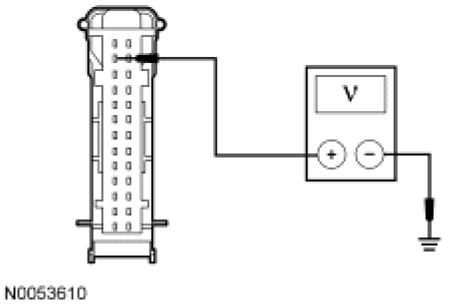

Fig. 5: Checking Circuit RMC32 (GN/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-12, circuit RMC32 (GN/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B6.

B6 CHECK CIRCUIT VMC11 (YE/VT) FOR AN OPEN

- Key in OFF position.

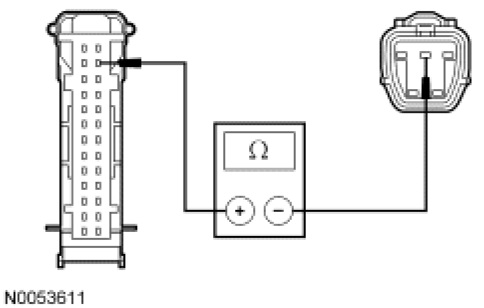

Fig. 6: Checking Circuit VMC11 (YE/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B7.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B7 CHECK CIRCUIT RMC32 (GN/BU) FOR AN OPEN

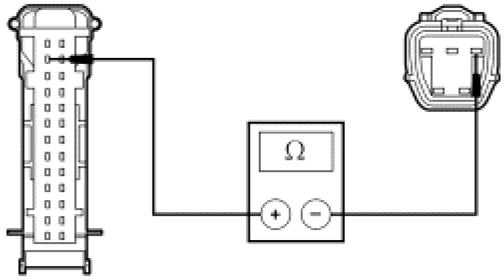

Fig. 7: Checking Circuit RMC32 (GN/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-12, circuit RMC32 (GN/BU), harness side and the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B14.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B8 CHECK THE FUEL PUMP MODULE FOR A SHORT TO GROUND

- Disconnect: Fuel Pump Module C433
- Key in ON position.
- Wait one minute.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test

NOTE: DTC B1204 may also be present when carrying out this step and should be ignored.

- Repeat the instrument cluster (IC) self-test.
- Retrieve the instrument cluster (IC) continuous DTCs.
- **Is DTC B1202 retrieved?**

  YES : Go to B13.

  NO : Go to B9.

B9 CHECK CIRCUITS VMC11 (YE/VT) AND RMC32 (GN/BU) FOR A SHORT TOGETHER

- Disconnect: Instrument Cluster (IC) C220
- Key in OFF position.

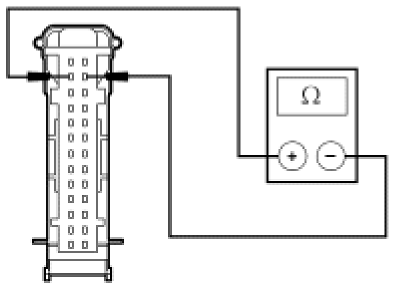

Fig. 8: Checking Circuits VMC11 (YE/VT) & RMC32 (GN/BU) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and the instrument cluster (IC) C220-12, circuit RMC32 (GN/BU), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B10.

  NO : REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test.

B10 CHECK CIRCUIT VMC11 (YE/VT) FOR A SHORT TO GROUND

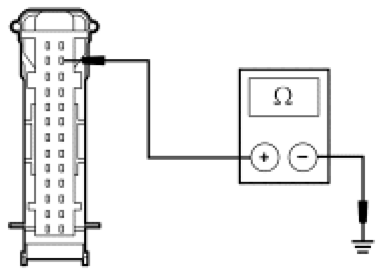

Fig. 9: Checking Circuit VMC11 (YE/VT) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B14.

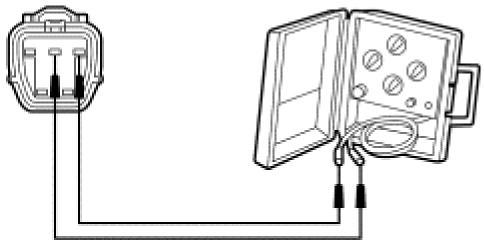
  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B11 CHECK THE FUEL LEVEL INPUT TO THE INSTRUMENT CLUSTER (IC)

NOTE:	**Since the instrument cluster (IC) may be in anti-slosh fuel indication mode, the PID values may not match the fuel gauge readings. The actual gauge indication should be disregarded during this test step.**

- Key in OFF position.

- Disconnect: Fuel Pump Module C433



N0026539

Fig. 10: Checking Fuel Level Input To Instrument Cluster
Courtesy of FORD MOTOR CO.

- Connect one lead of the instrument gauge system tester to the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side and the other lead to the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger

NOTE: **It is extremely important to confirm the gauge tester settings with an ohmmeter to ensure that the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results.**

- Select the instrument cluster (IC) fuel level (FUELLVL) PID.
- Monitor the fuel level PID with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms and 10 ohms.
- **Does the PID begin at approximately 0%, move to 25%, 50%, 75% then 100%?**

  YES : DISCONNECT the instrument gauge system tester. Go to B12.

  NO : DISCONNECT the instrument gauge system tester. Go to B14.

B12 CHECK THE FUEL TANK

- Check the fuel tank for any damage or deformation.
- **Is the fuel tank OK?**

  YES : Go to B13.

  NO : VERIFY the fuel level sensor and fuel pump module are OK. INSTALL a new fuel tank. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

B13 CHECK THE FUEL LEVEL SENSOR

NOTE: **The fuel level sensor resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position.**

- Remove the fuel pump module. Refer to **FUEL TANK AND LINES** article.

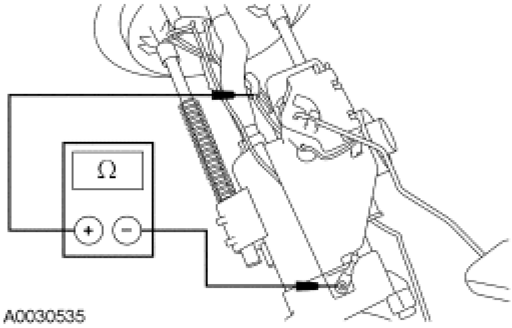


Fig. 11: Checking Fuel Level Sensor
Courtesy of FORD MOTOR CO.

NOTE: Disconnect the fuel level sensor input wire from the fuel level sensor for this measurement.

- Measure the resistance between the fuel level sensor input wire and the fuel level sensor ground while slowly moving the float arm between the upper and lower stop position.
- **Does the resistance slowly increase from approximately 10 ohms at the upper stop to 180 ohms at the lower stop?**

  YES : INSTALL a new fuel pump module. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new fuel level sensor. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

B14 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Incorrect Fuel Gauge Indication - All Wheel Drive (AWD)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The fuel pump module and the secondary fuel level sensor receive a reference voltage signal from the instrument cluster (IC) through circuits VMC11 (YE/VT) and VMC23 (GN/OG) respectively, and returns the fuel level signal to the instrument cluster (IC) through circuits RMC32 (GN/BU) and RMC33 (WH/VT) respectively. As the fuel level changes in each side of the fuel tank, a float actuates a variable resistor that alters the fuel level signal voltage. The instrument cluster (IC) interprets these signals and commands the fuel gauge to sweep to the correct level.

NOTE: The fuel pump module may also be called the fuel tank unit.

NOTE: The secondary fuel level sensor may also be called the fuel level sensor.

The fuel tank is a saddle tank design with 2 variable resistance senders, driven by floats, that provide resistances related to fuel height, in each side, to the cluster through hardwired inputs. The fuel level is read from each fuel sender through a 2-wire input. The fuel senders provide variable resistance between 180 ohms ± 4 ohms (empty tank) and 10 ohms ± 2 ohms (full tank). If the fuel level is low, the resistance in the fuel level sensor is high, causing the gauge to indicate empty (E). When the fuel level is high, the resistance in the fuel level sensor is low, and the gauge indicates full (F).

As fuel is consumed from the fuel pump module side of the fuel tank (the side with the fuel filler hose inlet), fuel is transferred from the secondary fuel level sensor side of the tank (the side opposite the fuel filler hose inlet) to the fuel pump module side of the tank. The fuel pump module is connected to the secondary fuel level sensor by a crossover line and transfers fuel when the fuel pump module is running.

The instrument cluster (IC) uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Key OFF fueling
- Key ON fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

Anti-Slosh Mode

The default fuel gauge mode is the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sender readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

Key Off Fueling Mode

The key OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The key must be in the OFF position during the entire refueling of the vehicle.

- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The instrument cluster (IC) must receive a valid key ON fuel sender reading within 1 second of the key being put into the RUN position. The key ON sample readings are considered valid if the fuel sender reading is between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

Key On Fueling Mode

The key ON fueling mode (approximately 90 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The transaxle is in PARK (P) (automatic transaxle), or the parking brake is applied (manual transaxle).
- The key is in the RUN position.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In key ON fueling mode, a 30-second timer activates after the transaxle is put into the PARK (P) position (automatic transaxle) or when the parking brake is applied (manual transaxle). When the 30-second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 90 seconds to read from empty (E) to full (F). When the transaxle is shifted out of PARK (P) or the parking brake is released, the fuel gauge strategy reverts to the anti-slosh mode. The key ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the key in the RUN position.

Recovery Mode

Recovery mode is incorporated into the instrument cluster (IC) strategy to recover from a missing fuel level input during a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sender or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiated when the following 2 conditions are met:

- The instrument cluster (IC) is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

INSTRUMENT CLUSTER (IC) DTCS

DTC Description	Fault Trigger Conditions
B1202 - Fuel Sender Circuit Open (fuel pump module)	A continuous and on-demand DTC that sets if the instrument cluster (IC) detects that the fuel sender is out of range on input circuit VMC11 (YE/VT) with an open or short to voltage. The instrument cluster (IC) defaults the fuel gauge to empty (E), once the instrument cluster (IC) detects a fault and sets DTC B1202.
B1204 - Fuel Sender Circuit Short to Ground (fuel	A continuous and on-demand DTC that sets if the instrument cluster (IC) detects that the fuel sender is out of range on input circuit VMC11 (YE/VT) with

pump module)	short to ground. The instrument cluster (IC) defaults the fuel gauge to empty (E), once the instrument cluster (IC) detects a fault and sets DTC B1204.
B2627 - Fuel Sender Circuit Open #2 (secondary fuel level sensor)	A continuous and on-demand DTC that sets when the instrument cluster (IC) detects an open or a short to voltage on the secondary fuel level sensor signal circuit. The instrument cluster (IC) defaults the fuel gauge to empty (E), once the instrument cluster (IC) detects a fault and sets DTC B2627.
B2628 - Fuel Sender Circuit Short to Ground #2 (secondary fuel level sensor)	A continuous DTC that sets when the instrument cluster (IC) detects a short to ground on the secondary fuel level sensor signal circuit. The instrument cluster (IC) defaults the fuel gauge to empty (E), once the instrument cluster (IC) detects a fault and sets DTC B2628.
B2879 - Fuel Tank Jet Pump Fault	**NOTE:** **Normal operation of the fuel delivery system allows the secondary side of the fuel tank (the side opposite of the fuel filler hose) to have less fuel than the side with the fuel pump module (side with the fuel filler hose).** A continuous DTC that sets when the instrument cluster (IC) detects a large discrepancy in the amount of fuel (based on input from the fuel senders) between both sides of the fuel tank. The fuel level in the secondary fuel level sensor side of the fuel tank (the side opposite the fuel filler hose inlet) has significantly more fuel than the fuel pump module side (the side with the fuel filler hose inlet).

PCM DTCS

DTC Description	Fault Trigger Conditions
DTC P0460 Fuel Level Sensor A Circuit	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
DTC P0461 Fuel Level Sensor A Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
	Sets in the PCM when the PCM detects a short to ground on the fuel

DTC P0462 Fuel Level Sensor A Circuit Low	pump module signal circuit based on the messaged input received from the instrument cluster (IC).
DTC P0463 Fuel Level Sensor A Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the instrument cluster (IC).
DTC P2065 Fuel Level Sensor B Circuit (secondary fuel level sensor)	Sets when the PCM determines the value of the fuel level sensor input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
DTC P2066 Fuel Level Sensor B Circuit Range/Performance (secondary fuel level sensor)	Sets when the PCM determines the fuel level sensor input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
DTC P2067 Fuel Level Sensor B Circuit Low (secondary fuel level sensor)	Sets in the PCM when the PCM detects a short to ground on the fuel level sensor signal circuit based on the messaged input received from the instrument cluster (IC).
DTC P2068 Fuel Level Sensor B Circuit High (secondary fuel level sensor)	Sets in the PCM when the PCM detects a open or short to voltage on the fuel level sensor signal circuit on the messaged input received from the instrument cluster (IC).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Fuel pump module assembly
- Secondary fuel level sensor
- Fuel level sensor (float and card)
- Fuel tank
- Instrument cluster (IC)

PINPOINT TEST C: INCORRECT FUEL GAUGE INDICATION - ALL WHEEL DRIVE (AWD)

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

C1 CHECK FOR INSTRUMENT CLUSTER (IC) DTCs

- Key in OFF position.
- Check for recorded instrument cluster (IC) DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

  YES : For DTC B1204 or B2628, go to C3.

  For DTC B1202, go to C7.

  For DTC B2627, go to C12.

  For DTC B2879, go to C17.

  For all other DTCs, REFER to **DTC Charts**.

  NO : Go to C2.

C2 CARRY OUT THE INSTRUMENT CLUSTER (IC) FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) fuel gauge (Fuel) active command and command the fuel gauge from 0% to 20%, 50%, 70% and 100% while observing the fuel gauge.
- **Does the fuel gauge begin at (E) empty, move to approximately 1/4, 1/2, 3/4 and F (full)?**

  YES : Go to C17.

  NO : Go to C21.

C3 CHECK THE SECONDARY FUEL LEVEL SENSOR FOR A SHORT TO GROUND

NOTE: The fuel pump module may also be called the fuel tank unit.

NOTE: The secondary fuel level sensor may also be called the fuel level sensor.

- Disconnect: Fuel Pump Module C433 (DTC B1204) or Secondary Fuel Level Sensor C3270 (DTC B2628)
- Key in ON position.
- Wait one minute.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test

  NOTE: DTC B1204 or B2628 may still be present.

- Repeat the instrument cluster (IC) on-demand self-test.
- **Is DTC B1202 or B2627 retrieved?**

  YES : Go to C4.

NO : INSTALL a new fuel sender for the suspect fuel sender. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

C4 CHECK CIRCUIT VMC11 (YE/VT) (DTC B1204) OR CIRCUIT VMC23 (GN/OG) (DTC B2628) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Instrument Cluster (IC) C220

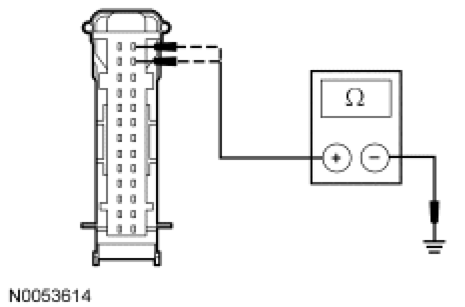

Fig. 12: Checking Circuit VMC11 (YE/VT) (DTC B1204) Or VMC23 (GN/OG) (DTC B2628) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25 (DTC B1204), circuit VMC11 (YE/VT) harness side and ground; or between the instrument cluster (IC) C220-26 (DTC B2628), circuit VMC23 (GN/OG) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : For DTC B1204, go to C5.

  For DTC B2628, go to C6.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK CIRCUITS VMC11 (YE/VT) AND RMC32 (GN/BU) FOR A SHORT TOGETHER

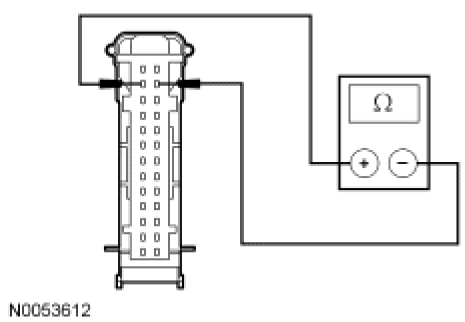

Fig. 13: Checking Circuits VMC11 (YE/VT) & RMC32 (GN/BU) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT)

harness side and the instrument cluster (IC) C220-12, circuit RMC32 (WH/VT) harness side.

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to C21.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C6 CHECK CIRCUITS VMC23 (GN/OG) AND RMC33 (WH/VT) FOR A SHORT TOGETHER

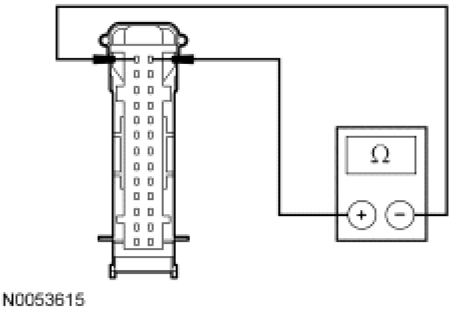

Fig. 14: Checking Circuits VMC23 (GN/OG) & RMC33 (WH/VT) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-26, circuit VMC23 (GN/OG) harness side and the instrument cluster (IC) C220-13, circuit RMC33 (WH/VT) harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to C21.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK THE FUEL PUMP MODULE CIRCUITRY FOR A SHORT TO VOLTAGE

- Disconnect: Instrument Cluster (IC) C220
- Key in ON position.

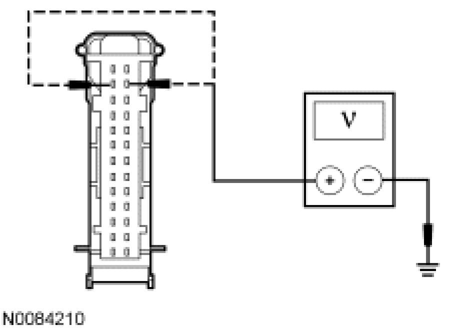

Fig. 15: Checking Fuel Pump Module Circuitry For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and ground; and between the instrument cluster (IC) C220-12, circuit RMC32 (GN/BU), harness side and ground.
- **Is any voltage present?**

YES : Go to C8.

NO : Go to C9.

C8 CHECK THE FUEL PUMP MODULE FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Fuel Pump Module C433
- Key in ON position.

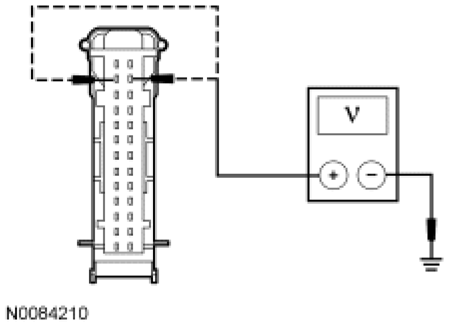

Fig. 16: Checking Fuel Pump Module For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and ground; and between the instrument cluster (IC) C220-12, circuit RMC32 (GN/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new fuel pump module. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

C9 CHECK THE FUEL PUMP MODULE CIRCUITRY FOR AN OPEN

- Key in OFF position.
- Disconnect: Fuel Pump Module C433

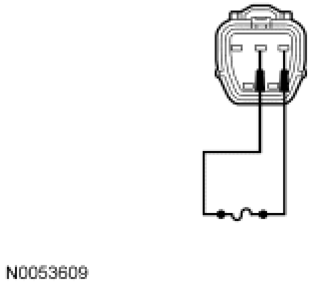

Fig. 17: Checking Fuel Pump Module For Open
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the fuel pump module C433-2, circuit VMC11

(YE/VT), harness side and the fuel pump module C433-1, circuit RMC32 (GN/BU) harness side.

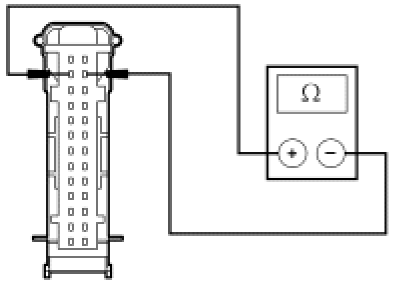

Fig. 18: Measuring Resistance Between Instrument Cluster (IC) C220-25 & C220-12, Circuit VMC11 (YE/VT) & RMC32 (GN/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and the instrument cluster (IC) C220-12, RMC32 (GN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : REMOVE the jumper wire. Go to C10.

  NO : REMOVE the jumper wire. Go to C11.

C10 CHECK THE FUEL PUMP MODULE FOR AN OPEN

NOTE:	**The fuel sender resistance varies from 180 ± 4 ohms when empty (E) to 10 ± 2 ohms when full (F).**

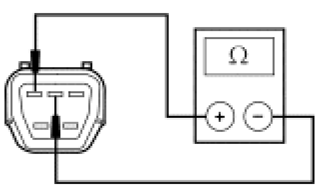

Fig. 19: Checking Fuel Pump Module For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the fuel pump module C433 pin 1, component side and the fuel pump module C433 pin 2, component side.
- **Is the resistance within specifications?**

  YES : Go to C21.

  NO : Go to C20.

C11 CHECK CIRCUIT VMC11 (YE/VT) FOR AN OPEN

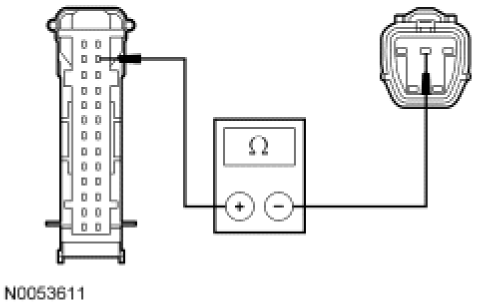

Fig. 20: Checking Circuit VMC11 (YE/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-25, circuit VMC11 (YE/VT), harness side and the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR circuit RMC32 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR circuit VMC11 (YE/VT). CLEAR the DTCs. REPEAT the self-test.

C12 CHECK THE SECONDARY FUEL SENDER CIRCUITRY FOR A SHORT TO VOLTAGE

- Disconnect: Instrument Cluster (IC) C220
- Key in ON position.

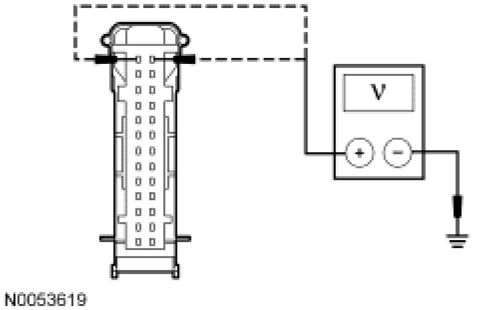

Fig. 21: Checking Secondary Fuel Sender Circuitry For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-26, circuit VMC23 (GN/OG), harness side and ground; and between the instrument cluster (IC) C220-13, circuit RMC33 (WH/VT), harness side and ground.
- **Is any voltage present?**

  YES : Go to C13.

  NO : Go to C14.

C13 CHECK CIRCUIT VMC23 (GN/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Secondary Fuel Sender C3270

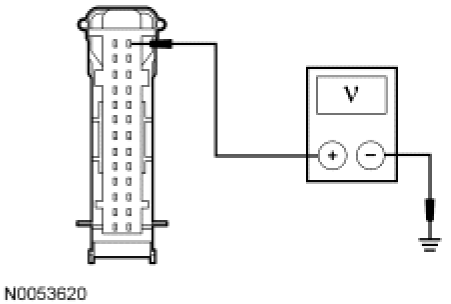

Fig. 22: Checking Circuit VMC23 (GN/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-26, circuit VMC23 (GN/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit VMC23 (GN/BU). CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR circuit RMC33 (WH/VT) for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

C14 CHECK THE SECONDARY FUEL LEVEL SENSOR FOR AN OPEN

NOTE: **The fuel sender resistance varies from 180 ± 4 ohms when empty (E) to 10 ± 2 ohms when full (F).**

- Key in OFF position.
- Disconnect: Secondary Fuel Level Sensor C3270

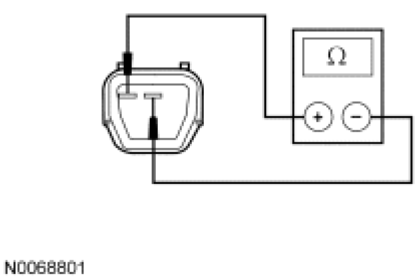

Fig. 23: Checking Secondary Fuel Level Sensor For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the secondary fuel level sensor C3095 pin 1, component side and the secondary fuel level sensor C3095 pin 2, component side.
- **Is the resistance within specifications?**

  YES : Go to C15.

  NO : INSTALL a new secondary fuel level sensor. REFER to **FUEL TANK AND LINES** article.

CLEAR the DTCs. REPEAT the self-test.

C15 CHECK THE SECONDARY FUEL LEVEL SENSOR CIRCUITRY FOR AN OPEN

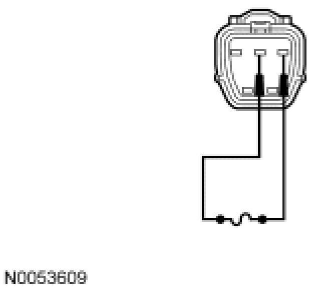

Fig. 24: Checking Fuel Pump Module For Open
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the secondary fuel level sensor C3270-1, circuit RMC33 (WH/VT), harness side and the secondary fuel level sensor C3270-2, circuit VMC23 (GN/OG), harness side.

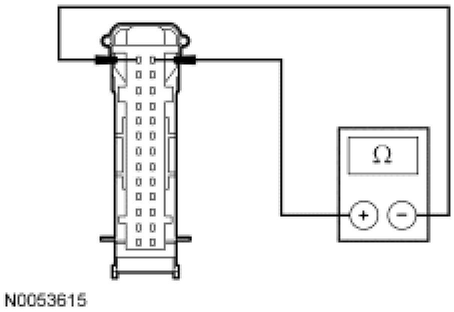

Fig. 25: Measuring Resistance Between Instrument Cluster (IC) C220-26 & C220-13, Circuit VMC23 (GN/OG) & RMC33 (WH/VT)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-26, circuit VMC23 (GN/OG), harness side and the instrument cluster (IC) C220-13, circuit RMC33 (WH/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : REMOVE the jumper wire. Go to C21.

  NO : REMOVE the jumper wire. Go to C16.

C16 CHECK CIRCUIT VMC23 (GN/OG) FOR AN OPEN

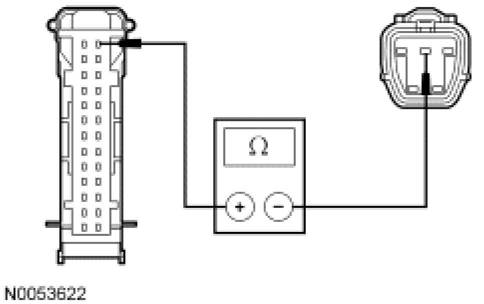

Fig. 26: Checking Circuit VMC23 (GN/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-26, circuit VMC23 (GN/OG), harness side and the secondary fuel level sensor C3270-2, circuit VMC23 (GN/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR circuit RMC33 (WH/VT) for an open. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR circuit VMC23 (GN/OG). CLEAR the DTCs. REPEAT the self-test.

C17 INSPECT THE FUEL TANK

- Visually inspect the fuel tank for any damage or deformation.
- **Is the fuel tank OK?**

  YES : Go to C18.

  NO : INSTALL a new fuel tank. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

C18 INSPECT THE FUEL TANK TRANSFER TUBE CONNECTIONS

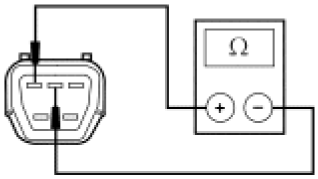
- Remove the fuel pump module and the secondary fuel level sensor. Refer to **FUEL TANK AND LINES** article.
- Inspect the fuel tank transfer tube, connections, the fuel pump module and the secondary fuel level sensor for any damage or deformation.
- **Are the fuel tank transfer tube, connections, the fuel pump module and the fuel level sensor OK?**

  YES : Go to C19.

  NO : INSTALL a new fuel tank transfer tube, fuel pump module or secondary fuel level sensor as necessary. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

C19 CHECK THE FUEL PUMP MODULE AND THE SECONDARY FUEL LEVEL SENSOR FOR CORRECT OPERATION

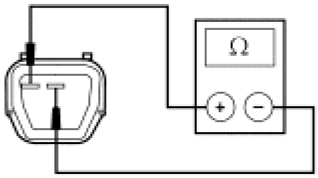
NOTE:	**The resistance varies from 180 ± 4 ohms when empty (E) to 10 ± 2 ohms when full (F).**



N0068798

Fig. 27: Checking Fuel Pump Module And Secondary Fuel Level Sensor For Correct Operation (Fuel Pump Module)
Courtesy of FORD MOTOR CO.

- For the fuel pump module, measure the resistance between the fuel pump module C433 pin 1, component side and the fuel pump module C433 pin 2, component side while slowly moving the float arm from the bottom to the top of travel.



N0068801

Fig. 28: Checking Fuel Pump Module And Secondary Fuel Level Sensor For Correct Operation (Secondary Fuel Level Sensor)
Courtesy of FORD MOTOR CO.

- For the secondary fuel level sensor, measure the resistance between the secondary fuel sender C3095 pin 1, component side and the secondary fuel level sensor C3095 pin 2, component side while slowly moving the float arm from the bottom to the top of travel.
- **Does the resistance start at approximately 180 ohms with the float at the bottom of travel and slowly increase to approximately 10 ohms at the top of travel?**

  YES : For DTC B2879, INSTALL a new fuel tank transfer tube or fuel level sender as required. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

  For no DTCs, the concern could have been caused by an intermittent input to the instrument cluster (IC), most likely created by corrosion on one of the fuel level sensors (float and card).

  NO : For the secondary fuel level sensor, INSTALL a new secondary fuel level sensor. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

  For the fuel pump module, go to C20.

C20 CHECK THE FUEL LEVEL SENSOR

NOTE:	**The fuel level sensor resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position.**

- Remove the fuel pump module. Refer to **FUEL TANK AND LINES** article.

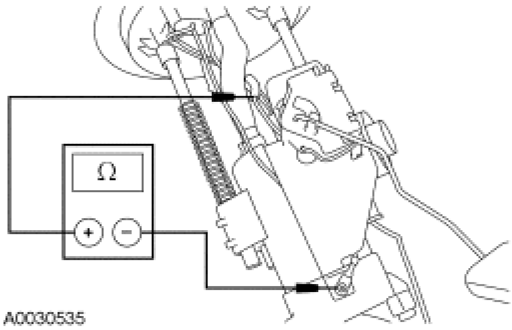


Fig. 29: Checking Fuel Level Sensor
Courtesy of FORD MOTOR CO.

NOTE:	**Disconnect the fuel level sensor input wire from the fuel level sensor for this measurement.**

- Measure the resistance between the fuel level sensor input wire and the fuel level sensor ground while slowly moving the float arm between the upper and lower stop position.
- **Does the resistance slowly increase from approximately 10 ohms at the upper stop to 180 ohms at the lower stop?**

  YES : INSTALL a new fuel pump module. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new fuel level sensor. REFER to **FUEL TANK AND LINES** article. CLEAR the DTCs. REPEAT the self-test.

C21 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose

or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: Incorrect Temperature Gauge Indication

Normal Operation

The PCM receives the engine coolant temperature status through hardwired circuitry to the engine coolant temperature (ECT) sensor (2.3L and 3.0L engines) or to the cylinder head temperature sensor (CHT) (3.5L engine). The instrument cluster (IC) receives the engine coolant temperature data from the PCM over the communication network. The instrument cluster (IC) monitors the engine coolant temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

This pinpoint test is intended to diagnose the following:

- Instrument cluster (IC)

PINPOINT TEST D: INCORRECT TEMPERATURE GAUGE INDICATION

D1 CHECK FOR CORRECT OPERATION OF THE COOLING SYSTEM

- Verify that the engine cooling system and thermostat are functioning correctly.
- **Is the engine cooling system and thermostat operating correctly?**

  YES : Go to D2.

  NO : REFER to **ENGINE COOLING** article.

D2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article to continue diagnosis of the DTCs.

  NO : Go to D3.

D3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1900 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the PCM.

  NO : Go to D4.

D4 CARRY OUT THE INSTRUMENT CLUSTER (IC) COOLANT TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger

NOTE: **The coolant temperature should range between 0-59°C (32-138°F) with the gauge in the cold (C) range, between 60-120°C (140-248°F)**

with the gauge in the normal or mid-range and above 123°C (253°F) with the gauge in the hot (H) range.

- Select the instrument cluster (IC) temperature gauge (ENGCOOLNT) active command. Command the temperature gauge according to the following table:

Temperature Command	Gauge Position
44°C (111°F)	Cold (C)
96°C (205°F)	Center of the gauge (mid-range)
121°C (250°F)	Beginning of the hot (H)
123°C (253°F)	Full hot (H)

- **Does the temperature gauge operate according to the above specifications?**

  YES : Go to D5.

  NO : Go to D7.

D5 CHECK THE PCM TEMPERATURE PIDs

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Key in START position.
- Select the PCM engine coolant temperature (ECT) (2.3L and 3.0L engines) or cylinder head temperature (CHT) (3.5L engine) PID and monitor the PID while the engine is running.
- **Does the PID agree with the position of the temperature gauge?**

  YES : INSTALL a new ECT (2.3L and 3.0L) or CHT (3.5L) sensor. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : Go to D6.

D6 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

D7 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Tachometer Is Inoperative

Normal Operation

The PCM uses the crankshaft position sensor to measure the engine rpm, and sends the instrument cluster (IC) the data over the communication network, to command the tachometer gauge according to the data.

This pinpoint test is intended to diagnose the following:

- Instrument cluster (IC)

PINPOINT TEST E: THE TACHOMETER IS INOPERATIVE

E1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

YES : REFER to the **Introduction - Gasoline Engines** article to continue diagnosis of the DTCs.

NO : Go to E2.

E2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1900 recorded?**

YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose

communication with the PCM.

NO : Go to E3.

E3 CARRY OUT THE INSTRUMENT CLUSTER (IC) TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) tachometer (TACH) active command. Command the tachometer on. Observe the tachometer.
- **Does the tachometer begin at 0 rpm and move to 7000 rpm when commanded on?**

  YES : Go to E4.

  NO : Go to E5.

E4 CHECK THE PCM RPM PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Select the PCM engine rpm (RPM) PID and monitor the PID while the engine is running.
- Start the engine.
- **Does the PID agree with the position of the tachometer gauge?**

  YES : The system is operating correctly at this time.

  NO : Go to E5.

E5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Speedometer/Odometer Is Inoperative

Normal Operation

The instrument cluster (IC) receives the vehicle speed sensor (VSS) signal from the PCM over the communication network. The PCM receives the VSS information from the output shaft speed (OSS) sensor. The instrument cluster (IC) monitors the VSS input from the PCM and commands the speedometer with a corresponding movement of the pointer. The odometer is tamper resistant and accumulates and registers up to 1 million kilometers in metric mode or 1 million miles in English mode, based upon rolling count data sent from

the PCM over the communication network.

This pinpoint test is intended to diagnose the following:

- PCM
- Instrument cluster (IC)

PINPOINT TEST F: THE SPEEDOMETER/ODOMETER IS INOPERATIVE

F1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article to continue diagnosis of the DTCs.

  NO : Go to F2.

F2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1900 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article.

  NO : If the speedometer is inoperative, go to F3.

  If the odometer is inoperative, go to F5.

F3 CARRY OUT THE INSTRUMENT CLUSTER (IC) SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) speedometer (SPDOMETER) active command. Command the speedometer on. Observe the speedometer.
- **Does the speedometer begin at 0 km/h (0 mph) and move to 193 km/h (120 mph)?**

  YES : Go to F4.

  NO : Go to F7.

F4 CHECK THE PCM VSS PIDs

NOTE:	**This step may require the use of an assistant to monitor and record the scan tool data.**

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger

NOTE:	**The speedometer should register approximately the same speed as the VSS PID ± 8 km/h (5 mph).**

- Monitor the PCM vehicle speed (VSS) PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph).
- **Does the PID indicate vehicle speed?**

  YES : Go to F7.

  NO : Go to F6.

F5 MONITOR THE DISPLAY SEGMENT CONTROL DISPLAY

- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the display segment control (SEGMENT_2) active command. Command the display segment active command on.
- **Do the display segments illuminate correctly?**

  YES : Go to F6.

  NO : Go to F7.

F6 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

F7 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: Incorrect Speedometer Indication

Normal Operation

The instrument cluster (IC) receives the vehicle speed sensor (VSS) signal from the PCM over the communication network. The PCM receives the VSS information from the output shaft speed (OSS) sensor. The instrument cluster (IC) monitors the VSS input from the PCM and commands the speedometer with a corresponding movement of the pointer. The odometer is tamper resistant and accumulates and registers up to 1 million kilometers in metric mode or 1 million miles in English mode, based upon rolling count data sent from the PCM over the communication network.

This pinpoint test is intended to diagnose the following:

- Tire size configuration
- Axle ratio configuration
- PCM
- Instrument cluster (IC)

PINPOINT TEST G: INCORRECT SPEEDOMETER INDICATION

G1 VERIFY THE VEHICLE TIRE SIZE AND AXLE RATIO CONFIGURATION

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Module Programming
- Select programmable parameters and confirm that the axle ratio and tire size is correctly configured.
- **Is the axle ratio and tire size correctly configured?**

  YES : Go to G2.

  NO : Configure the axle ratio or tire size as required. TEST the system for normal operation.

G2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any PCM DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article to continue diagnosis of the DTCs.

  NO : Go to G3.

G3 CARRY OUT THE INSTRUMENT CLUSTER (IC) SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL

- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) speedometer (SPDOMETER) active command. Command the speedometer in increments of 10%. Observe the speedometer.
- **Does the speedometer begin at 0 km/h (0 mph) and increase by approximately 19 km/h (12 mph)?**

  YES : Go to G4.

  NO : Go to G6.

G4 CHECK THE PCM VSS PIDs

NOTE: This step may require the use of an assistant to monitor and record the scan tool data.

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger

  NOTE: The speedometer should register approximately the same speed as the VSS PID ± 8 km/h (5 mph).

- Monitor the PCM vehicle speed (VSS) PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph).
- **Does the speedometer indication agree with the PCM VSS PID within specification?**

  YES : Go to G5.

  NO : Go to G6.

G5 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

G6 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Low Fuel Indicator Is Never/Always On (If Equipped)

Normal Operation

The low fuel indicator is illuminated when the fuel level reaches a predetermined level of approximately 1/8 tank. The low fuel indicator and the fuel gauge are controlled by the instrument cluster (IC) based upon the fuel level data provided by the fuel sender. When the instrument cluster (IC) receives the data, the fuel gauge indicates low fuel and the instrument cluster (IC) illuminates the low fuel indicator.

This pinpoint test is intended to diagnose the following:

- Instrument cluster (IC)

PINPOINT TEST H: THE LOW FUEL INDICATOR IS NEVER/ALWAYS ON (IF EQUIPPED)

H1 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) low fuel indicator (FUEL_LOW) active command. Command the low fuel indicator on and off. Observe the low fuel indicator.
- **Does the low fuel indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to H2.

  NO : Go to H3.

H2 CHECK THE FUEL GAUGE OPERATION

- Monitor the fuel gauge.
- **Does the fuel gauge operate correctly?**

  YES : The system is operating correctly at this time. The fuel level must be below 1/8 tank for the instrument cluster (IC) to turn on the low fuel indicator.

  NO : For front wheel drive (FWD), go to **Pinpoint Test B**.

  For all wheel drive (AWD), go to **Pinpoint Test C**.

H3 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Brake Warning Indicator Is Never On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

When the parking brake is applied, the parking brake warning indicator switch grounds circuit CCB09 (GY/BU) to the smart junction box (SJB). The SJB receives the ground signal and sends the instrument cluster (IC) a message over the communication network to illuminate the brake warning indicator. When the brake fluid level is low, the brake fluid level switch closes, and the signal from the SJB on circuit CMC19 (GY/VT) is grounded on circuit GD121 (BK/YE). When a base brake system concern is detected, the ABS module sends a signal to the instrument cluster (IC) over the communication network to illuminate the brake system warning indicator.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch (part of the brake fluid reservoir)
- SJB
- Instrument cluster (IC)

PINPOINT TEST I: THE BRAKE WARNING INDICATOR IS NEVER ON

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

I1 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) brake warning indicator (BRK_LAMP) active command. Command the brake warning indicator on. Observe the brake warning indicator.
- **Does the brake warning indicator illuminate when commanded on?**

  YES : Go to I2.

NO : Go to I10.

I2 CHECK THE BRAKE WARNING INDICATOR WITH THE PARKING BRAKE APPLIED

- Apply the parking brake while monitoring the brake warning indicator.
- **Does the brake warning indicator illuminate?**

YES : Go to I6.

NO : Go to I3.

I3 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID

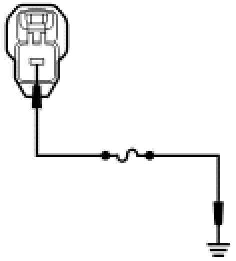
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB parking brake warning indicator switch (PRK_BRK) PID while applying the parking brake.
- **Does the PID agree with the parking brake position?**

YES : Go to I9.

NO : Go to I4.

I4 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH

- Disconnect: Parking Brake Warning Indicator Switch C306



N0026569

Fig. 30: Checking Parking Brake Warning Indicator Switch
Courtesy of FORD MOTOR CO.

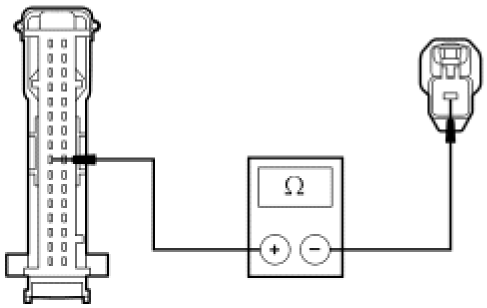
- Connect a fused (5A) jumper wire between the parking brake warning indicator switch C306-1, circuit CCB09 (GY/BU), harness side and ground.
- **Does the brake warning indicator illuminate?**

YES : REMOVE the jumper wire. INSTALL a new parking brake warning indicator switch. REFER to **PARKING BRAKE AND ACTUATION** article. TEST the system for normal operation.

NO : REMOVE the jumper wire. Go to I5.

I5 CHECK CIRCUIT CCB09 (GY/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280c



N0026570

Fig. 31: Checking Circuit CCB09 (GY/BU) For Open
Courtesy of FORD MOTOR CO.

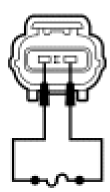
- Measure the resistance between the SJB C2280c-9, circuit CCB09 (GY/BU), harness side and the parking brake warning indicator switch C306-1, circuit CCB09 (GY/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I9.

  NO : REPAIR the circuit. TEST the system for normal operation.

I6 CHECK THE BRAKE FLUID LEVEL WARNING INDICATOR OPERATION FROM THE BRAKE FLUID LEVEL SWITCH

- Key in OFF position.
- Disconnect: Brake Fluid Level Switch C124
- Key in ON position.



N0026571

Fig. 32: Checking Brake Fluid Level Warning Indicator Operation From Brake Fluid Level Switch
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between the brake fluid level switch C124-1, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-2, circuit GD121 (BK/YE), harness side.
- Monitor the brake warning indicator.
- **Does the brake warning indicator illuminate?**

  YES : REMOVE the jumper wire. INSTALL a new brake fluid reservoir. REFER to **HYDRAULIC BRAKE ACTUATION** article. TEST the system for normal operation.

NO : REMOVE the jumper wire. Go to I7.

I7 CHECK CIRCUIT GD121 (BK/YE) FOR AN OPEN

- Key in OFF position.

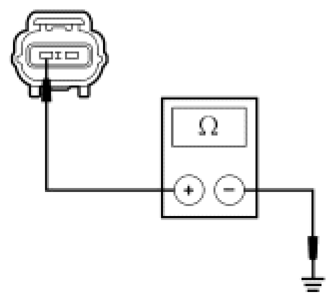


Fig. 33: Checking Circuit GD121 (BK/YE) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the brake fluid level switch C124-2, circuit GD121 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to I8.

NO : REPAIR the circuit. TEST the system for normal operation.

I8 CHECK CIRCUIT CMC19 (GY/VT) FOR AN OPEN

- Disconnect: SJB C2280a

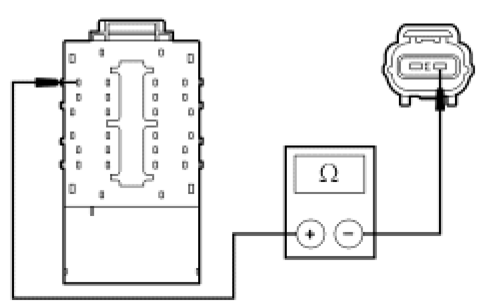

Fig. 34: Checking Circuit CMC19 (GY/VT) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280a-25, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-1 , circuit CMC19 (GY/VT), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to I9.

NO : REPAIR the circuit. TEST the system for normal operation.

I9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.

- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify that the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

I10 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify that the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Brake Warning Indicator Is Always On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

When the parking brake is applied, the parking brake warning indicator switch grounds circuit CCB09 (GY/BU) to the smart junction box (SJB). The SJB receives the ground signal and sends the instrument cluster (IC) a message over the communication network to illuminate the brake warning indicator. When the brake fluid level is low, the brake fluid level switch closes, the signal from the SJB on circuit CMC19 (GY/VT) is grounded on circuit GD121 (BK/YE). When the ABS module detects a base brake system concern or other ABS related concerns that affect the electronic brake distribution (EBD) function, the ABS module sends a message to the instrument cluster (IC) to illuminate both the ABS warning indicator and the brake warning indicator.

NOTE: When the ABS module detects an electronic brake distribution (EBD) fault, the

ABS module sends a message to the instrument cluster (IC). Whenever the instrument cluster (IC) receives an EBD message from the ABS module, the instrument cluster (IC) illuminates both the brake warning indicator and the ABS warning indicator simultaneously.

- DTC B2479 (Brake Park Switch Circuit Short to Ground) - is an on-demand DTC that sets in the SJB if a short to ground is detected on the parking brake input, circuit CCB09 (GY/BU).
- DTC C1125 (Brake Fluid Level Sensor Input Circuit Failure) - is an on-demand DTC that sets in the SJB if a short to ground is detected on the brake fluid level input, circuit CMC19 (GY/VT).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch (part of the brake fluid reservoir)
- Base brake system
- SJB
- Instrument cluster (IC)

PINPOINT TEST J: THE BRAKE WARNING INDICATOR IS ALWAYS ON

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Verify that the parking brake is fully released and the brake fluid level is full before proceeding with diagnostics.**

J1 CHECK THE BASE BRAKE SYSTEM

- Operate the brakes and verify that the base braking system operates correctly.
- **Does the base braking system operate correctly?**

  YES : Go to J2.

  NO : REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.

J2 CHECK THE ABS WARNING INDICATOR OPERATION

- Key in ON position.
- Monitor the ABS warning indicator and the brake warning indicator following prove-out.
- **Do both the ABS and brake warning indicators illuminate after prove-out?**

  YES : Go to **Pinpoint Test K**.

  NO : Go to J3.

J3 CHECK FOR INSTRUMENT CLUSTER (IC) DTCs

- Key in OFF position.
- Check for recorded continuous memory instrument cluster (IC) DTCs.

- **Is DTC U1901 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnosis no communication with the SJB.

  NO : Go to J4.

J4 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS

- Check for recorded SJB DTCs from the continuous and on-demand self-tests.
- **Are any SJB DTCs recorded?**

  YES : If DTC B2479 is retrieved, go to J6.

  If DTC C1125 is retrieved, go to J9.

  For all other SJB DTCs, REFER to **DTC Charts**.

  NO : Go to J5.

J5 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) brake warning indicator (BRK_LAMP) active command. Command the brake warning indicator on then off. Observe the brake warning indicator.
- **Does the brake warning indicator illuminate when commanded on and turn off when commanded off?**

  YES : Go to J11.

  NO : Go to J12.

J6 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB parking brake warning indicator switch (PRK_BRK) PID while applying and releasing the parking brake.
- **Does the PID agree with the parking brake position?**

  YES : Go to J11.

  NO : Go to J7.

J7 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH

- Key in OFF position.
- Disconnect: Parking Brake Warning Indicator Switch C306
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB parking brake warning indicator switch (PRK_BRK) PID.
- **Does the PID indicate that the parking brake is off?**

YES : INSTALL a new parking brake warning indicator switch. REFER to **PARKING BRAKE AND ACTUATION** article. CLEAR the DTCs. REPEAT the self-test.

NO : Go to J8.

J8 CHECK CIRCUIT CCB09 (GY/BU) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c

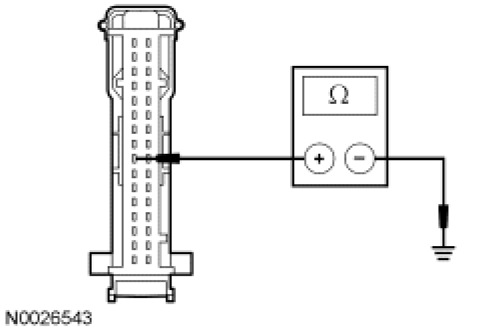

Fig. 35: Checking Circuit CCB09 (GY/BU) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280c-9, circuit CCB09 (GY/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to J11.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

J9 CHECK THE BRAKE FLUID LEVEL SWITCH OPERATION

- Key in OFF position.
- Disconnect: Brake Fluid Level Switch C124
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB Self-Test
- Clear the SJB DTCs. Repeat the SJB self-test.
- **Is DTC C1125 still present?**

  YES : Go to J10.

  NO : INSTALL a new brake fluid reservoir. REFER to **HYDRAULIC BRAKE ACTUATION** article. CLEAR the DTCs. REPEAT the self-test.

J10 CHECK CIRCUIT CMC19 (GY/VT) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280a

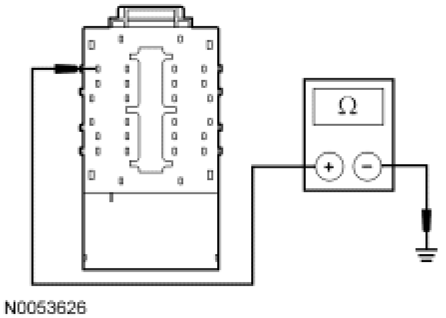

Fig. 36: Checking Circuit CMC19 (GY/VT) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280a-25, circuit CMC19 (GY/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to J11.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

J11 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify that the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

J12 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify that the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the

system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The ABS Warning Indicator Is Never/Always On

Normal Operation

The status of the ABS system is sent to the instrument cluster (IC) from the ABS module over the communication network. The instrument cluster (IC) monitors the ABS input and illuminates the ABS warning indicator when a concern is present.

NOTE: When the ABS module detects an electronic brake distribution (EBD) fault, the ABS module sends a message to the instrument cluster (IC). Whenever the instrument cluster (IC) receives an EBD message from the ABS module, the instrument cluster (IC) illuminates both the brake warning indicator and the ABS warning indicator simultaneously.

This pinpoint test is intended to diagnose the following:

- ABS module
- Instrument cluster (IC)

PINPOINT TEST K: THE ABS WARNING INDICATOR IS NEVER/ALWAYS ON

K1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND ABS MODULE SELF-TESTS

- Check for recorded ABS module DTCs from the continuous and on-demand self-tests.
- **Are any ABS module DTCs recorded?**

  YES : REFER to **VEHICLE DYNAMIC SYSTEMS** article.

  NO : Go to K2.

K2 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) ABS warning indicator (ABS_LAMP) active command. Command the ABS warning indicator on and off. Observe the ABS warning indicator.
- **Does the ABS warning indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to K3.

  NO : Go to K4.

K3 CHECK FOR CORRECT ABS MODULE OPERATION

- Disconnect the ABS module connector.
- Check for:

    - corrosion
    - damaged pins
    - pushed-out pins
- Connect the ABS module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **VEHICLE DYNAMIC SYSTEMS** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

K4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
    - corrosion
    - damaged pins
    - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The safety belt warning indicator informs the driver that his or her safety belt and/or the front passenger's safety belt is unbuckled. During the first 70 seconds after the ignition switch transitions from OFF or ACC to RUN or START, the safety belt warning indicator and the associated chime are used as a reminder to the driver that the front row safety belts are not buckled. During this first 70 seconds the indicator illuminates when the driver and/or front passenger safety belt is unbuckled (with a person in the seat) and turns off whenever the safety belt (s) in the occupied front row seat(s) is buckled. The indicator illuminates again if a safety belt is unbuckled after both are buckled and the 70 seconds has not yet expired.

The safety belt switch is hardwired to the restraints control module (RCM). The instrument cluster (IC) receives the safety belt switch status from the RCM over the communication network. The RCM signals the instrument cluster (IC), when the safety belt is unfastened, to illuminate the safety belt warning indicator.

This pinpoint test is intended to diagnose the following:

- RCM

- Instrument cluster (IC)

PINPOINT TEST L: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

L1 RETRIEVE THE RECORDED RCM DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS

- Check for recorded RCM DTCs from the continuous and on-demand self-tests.
- **Are any RCM DTCs recorded?**

YES : REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to L2.

L2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1900 recorded?**

YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the RCM.

NO : Go to L3.

L3 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) safety belt warning indicator (SBLT_LAMP) active command. Command the safety belt warning indicator active command on and off. Observe the safety belt warning indicator.
- **Does the safety belt warning indicator illuminate when commanded on, and turn off when commanded off?**

YES : Go to L4.

NO : Go to L5.

L4 CHECK FOR CORRECT RCM OPERATION

- Disconnect all the RCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the RCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new RCM. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose

or corroded connector.

L5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: The Air Bag Warning Indicator Is Never/Always On

Normal Operation

The air bag warning indicator provides an indication that there is a restraint system problem and the air bag may be inoperable or have degraded performance. If the instrument cluster (IC) does not receive the restraint control command over the communication network, the instrument cluster (IC) illuminates the air bag warning indicator. When a fault is detected in the primary air bag warning indication, the instrument cluster (IC) sets DTC B1868 and defaults to the secondary warning and the air bag warning chime sounds.

This pinpoint test is intended to diagnose the following:

- Restraints control module (RCM)
- Instrument cluster (IC)

PINPOINT TEST M: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

M1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND RCM SELF-TESTS

- Check for recorded RCM DTCs from the continuous and on-demand self-tests.
- **Are any RCM DTCs recorded?**

  YES : If the air bag warning indicator is always on, REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article to continue diagnosis of the air bag system.

  If the air bag warning indicator is never on, go to M2.

  NO : Go to M2.

M2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Are any DTCs recorded?**

  YES : For DTC U1900, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the RCM.

  For all other DTCs, REFER to **DTC Charts**.

  NO : Go to M3.

M3 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) air bag warning indicator (RESTRAINT) active command. Command the air bag warning indicator on and off. Observe the air bag warning indicator.
- **Does the air bag warning indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to M4.

  NO : Go to M5.

M4 CHECK FOR CORRECT RCM OPERATION

- Disconnect all the RCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the RCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new RCM. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

M5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: The Tire Pressure Monitoring System (TPMS) Warning Indicator Is Never/Always On

Normal Operation

The instrument cluster (IC) receives the TPMS messages from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. If the SJB determines that the tire pressure has exceeded the low tire pressure limits, a message is sent to the instrument cluster (IC) to turn the TPMS warning indicator on. If a TPMS fault condition exists, the SJB sends a message to the instrument cluster (IC) to flash the TPMS warning indicator. If the TPMS status message is missing for less than 5 seconds, the instrument cluster (IC) defaults the TPMS warning indicator to the last setting (on or off), based upon the last known good message received. If the TPMS status message is missing for more than 5 seconds, the instrument cluster (IC) sets DTC U0140 and flashes the TPMS indicator for approximately 75 seconds then turns on the indicator steady.

NOTE: **If DTC U0140 is set in the SJB, other symptoms may also be present such as high beam indicator, RH/LH turn indicators, instrument panel backlighting, and door ajar indication.**

This pinpoint test is intended to diagnose the following:

- Tire pressure
- TPMS concern
- SJB
- Instrument cluster (IC)

PINPOINT TEST N: THE TIRE PRESSURE MONITORING SYSTEM (TPMS) WARNING INDICATOR IS NEVER/ALWAYS ON

N1 CHECK THE TIRE PRESSURE

- Verify that the tire pressure in all tires meets the recommended tire pressures on the vehicle certification label. Refer to **IDENTIFICATION CODES** article.
- **Do all the tires meet the recommended tire pressures?**

YES : Go to N2.

NO : CORRECT the tire pressures. TEST the system for normal operation.

N2 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the TPMS warning indicator (TPM_IND) active command. Command the TPMS warning indicator on and off. Observe the TPMS warning indicator.

- **Does the TPMS warning indicator illuminate when commanded on and turn off when commanded off?**

  YES : Go to N3.

  NO : Go to N6.

N3 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Are any DTCs recorded?**

  YES : For DTC U1901, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the SJB.

  For all other DTCs, REFER to **DTC Charts**.

  NO : Go to N4.

N4 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS

- Check for recorded SJB DTCs from the continuous and on-demand self-tests.
- **Are any TPMS DTCs recorded?**

  YES : REFER to **WHEELS AND TIRES** article.

  NO : Go to N5.

N5 CHECK FOR CORRECT SJB MODULE OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify that the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

N6 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect all the instrument cluster (IC) connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the instrument cluster (IC) connectors and make sure they seat correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Door Ajar Warning Indicator Is Never/Always On

Normal Operation

The door ajar indicator informs the driver if any of the doors, or the decklid is not completely closed. The information is sent from the smart junction box (SJB) to the instrument cluster (IC) over the communication network.

This pinpoint test is intended to diagnose the following:

- Interior lamps concern
- SJB
- Instrument cluster (IC)

PINPOINT TEST O: THE DOOR AJAR WARNING INDICATOR IS NEVER/ALWAYS ON

O1 CHECK THE OPERATION OF THE INTERIOR LAMPS

- Open and close each door, and the decklid, and monitor the interior lamps.
- **Do the interior lamps operate correctly?**

  YES : Go to O2.

  NO : REFER to **INTERIOR LIGHTING** article.

O2 CARRY OUT THE INSTRUMENT CLUSTER (IC) WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) door ajar warning lamp (AJAR_LAMP) active command. Command the door ajar warning lamp on and off. Observe the door ajar warning indicator.
- **Does the door ajar warning indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to O3.

  NO : Go to O5.

O3 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Are any DTCs recorded?**

  YES : For DTC U1901, REFER to **MODULE COMMUNICATIONS NETWORK** article to

diagnose communication with the SJB.

For all other DTCs, REFER to **DTC Charts**.

NO : Go to O4.

O4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

O5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: The High Beam Indicator Is Never/Always On

Normal Operation

When the high beams are turned on, the smart junction box (SJB) sends a signal to the instrument cluster (IC) through the communication network to illuminate the high beam indicator.

This pinpoint test is intended to diagnose the following:

- SJB

- Instrument cluster (IC)

PINPOINT TEST P: THE HIGH BEAM INDICATOR IS NEVER/ALWAYS ON

P1 CHECK THE HIGH BEAM HEADLAMPS OPERATION

- Turn the headlamp switch to the HIGH BEAMS ON position. Observe the high beam headlamps.
- **Do the high beam headlamps operate correctly?**

  YES : Go to P2.

  NO : REFER to **EXTERIOR LIGHTING** article.

P2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1901 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the SJB.

  NO : Go to P3.

P3 CARRY OUT THE INSTRUMENT CLUSTER (IC) WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) high beam indicator (HIGH_BEAM) active command. Command the high beam indicator on and off. Observe the high beam indicator.
- **Does the high beam indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to P4.

  NO : Go to P5.

P4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

P5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Q: The LH/RH Turn Signal Indicator Is Never/Always On

Normal Operation

When the multifunction switch is in the LH or RH turn signal position, a message is sent to the instrument cluster (IC) from the smart junction box (SJB) through the communication network, and the LH or RH turn signal indicator flashes on and off.

This pinpoint test is intended to diagnose the following:

- SJB
- Instrument cluster (IC)

PINPOINT TEST Q: THE LH TURN SIGNAL INDICATOR IS NEVER/ALWAYS ON

Q1 CHECK THE LH OR RH TURN SIGNAL LAMPS OPERATION

- Key in ON position.
- Operate the LH or RH turn signal. Observe the exterior LH or RH turn lamps.
- **Do the LH or RH turn lamps operate correctly?**

  YES : Go to Q2.

  NO : REFER to **EXTERIOR LIGHTING** article.

Q2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1901 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the SJB.

  NO : Go to Q3.

Q3 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL

ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) LH turn indicator (L_TURN) or RH turn indicator (R_TURN) active command. Command the LH or RH turn signal indicator on and off. Observe the LH or RH turn signal indicator.
- **Does the LH or RH turn signal indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to Q4.

  NO : Go to Q5.

Q4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Q5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test R: The Anti-Theft Indicator Is Never/Always On

Normal Operation

The anti-theft indicator proves out for 3 seconds when the key is turned to the ON or START position under normal operation. If there is a passive anti-theft system (PATS) concern, the anti-theft indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or the START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the instrument cluster (IC).

This pinpoint test is intended to diagnose the following:

- PATS concern
- Instrument cluster (IC)

PINPOINT TEST R: THE ANTI-THEFT INDICATOR IS NEVER/ALWAYS ON

R1 CARRY OUT THE INSTRUMENT CLUSTER (IC) ANTI-THEFT INDICATOR ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) anti-theft indicator (ANTITHEFT) active command. Command the anti-theft indicator on and off. Observe the anti-theft indicator.
- **Does the anti-theft indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to R2.

  NO : Go to R3.

R2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Are any PATS related DTCs recorded?**

  YES : REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

  NO : Go to R3.

R3 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect all the instrument cluster (IC) connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the instrument cluster (IC) connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test S: The Low Oil Pressure Warning Indicator Is Never/Always On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The oil pressure switch is hardwired to the smart junction box (SJB) through circuit CMC24 (GY). When the oil pressure is within normal ranges, the oil pressure switch closes, grounding the signal to the SJB. The SJB then sends a command message to the instrument cluster (IC) over the communication network, to turn off the low oil pressure warning indicator. When engine oil pressure is low, the oil pressure switch opens, removing the ground to the SJB. The SJB sends a low oil pressure message to the instrument cluster (IC) over the communication network to illuminate the low oil pressure warning indicator.

- DTC C1284 (Oil Pressure Switch Failure) - is an on-demand DTC that sets in the SJB if the SJB detects a short to ground on the oil pressure input, circuit CMC24 (GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Oil pressure switch
- Base engine concern
- SJB
- Instrument cluster (IC)

PINPOINT TEST S: THE LOW OIL PRESSURE WARNING INDICATOR IS NEVER/ALWAYS ON

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

S1 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) low oil pressure indicator (OIL_P_LOW) active command. Command the low oil pressure warning indicator on and off. Observe the low oil pressure warning indicator.
- **Does the low oil pressure warning indicator illuminate when commanded on, and turn off when commanded off?**

  YES : If the oil pressure indicator is never on, go to S2.

  If the oil pressure indicator is always on, go to S4.

  NO : Go to S8.

S2 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH

- Key in OFF position.
- Disconnect: Engine Oil Pressure Switch C103
- Key in ON position.
- Observe the low oil pressure warning indicator.
- **Does the low oil pressure warning indicator turn on?**

  YES : INSTALL a new engine oil pressure switch. REFER to **ENGINE - 2.3L** article, **ENGINE - 3.0L (4V)** article or **ENGINE - 3.5L** article. TEST the system for normal operation.

  NO : Go to S3.

S3 CHECK CIRCUIT CMC24 (GY) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280a

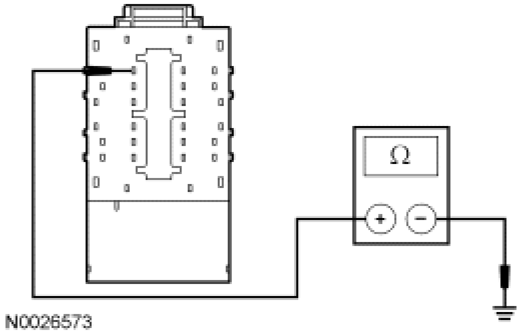

Fig. 37: Checking Circuit CMC24 (GY) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280a-26, circuit CMC24 (GY), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to S7.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

S4 MONITOR THE LOW OIL PRESSURE WARNING INDICATOR

- Key in OFF position.
- Disconnect: Oil Pressure Switch C103
- Key in ON position.

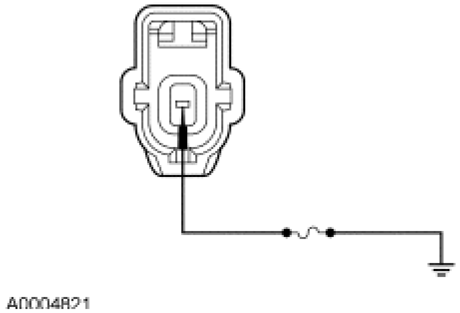

Fig. 38: Monitoring Low Oil Pressure Warning Indicator
Courtesy of FORD MOTOR CO.

- Connect a fused (5A) jumper wire between the oil pressure switch C103-1, circuit CMC24 (GY), harness side and ground.
- **Does the low oil pressure warning indicator turn off?**

  YES : REMOVE the jumper wire. Go to S5.

  NO : REMOVE the jumper wire. Go to S6.

S5 CARRY OUT THE ENGINE OIL PRESSURE TEST

- Carry out the engine oil pressure test. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
- **Is the engine oil pressure within specification?**

  YES : INSTALL a new oil pressure switch. REFER to **ENGINE - 2.3L** article, **ENGINE - 3.0L (4V)** article or **ENGINE - 3.5L** article. TEST the system for normal operation.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article.

S6 CHECK CIRCUIT CMC24 (GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a

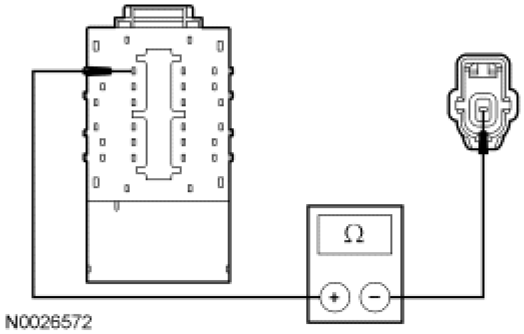

Fig. 39: Checking Circuit CMC24 (GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280a-26, circuit CMC24 (GY), harness side and the oil pressure switch C103-1, circuit CMC24 (GY), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to S7.

NO : REPAIR the circuit. TEST the system for normal operation.

S7 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

S8 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test T: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The MIL is controlled by the instrument cluster (IC) using data sent from the PCM over the communication network. When an emission system concern exists, the PCM sets a DTC and sends the instrument cluster (IC) a message to turn on the MIL.

This pinpoint test is intended to diagnose the following:

- PCM
- Instrument cluster (IC)

PINPOINT TEST T: THE MALFUNCTION INDICATOR LAMP (MIL) IS NEVER/ALWAYS ON

T1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any PCM DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article.

  NO : Go to T2.

T2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1900 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the PCM.

  NO : Go to T3.

T3 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) MIL indicator (MIL_IC) active command. Command the MIL on and off. Observe the MIL.
- **Does the MIL illuminate when commanded on, and turn off when commanded off?**

  YES : Go to T4.

  NO : Go to T5.

T4 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

T5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.

- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test U: The Powertrain Malfunction (Wrench) Warning Indicator is Never/Always On

Normal Operation

The PCM, the transmission control module (TCM) and the 4X4 control module (if equipped) monitor the powertrain system and provide the instrument cluster (IC) with the operating status over the communication network. When a system concern is detected, the PCM, the TCM or the 4X4 control module provide the instrument cluster (IC) with a signal commanding the instrument cluster (IC) to illuminate the powertrain malfunction (wrench) warning indicator.

This pinpoint test is intended to diagnose the following:

- TCM
- PCM
- 4X4 control module (if equipped)
- Instrument cluster (IC)

PINPOINT TEST U: THE POWERTRAIN MALFUNCTION (WRENCH) WARNING INDICATOR IS NEVER/ALWAYS ON

U1 OBSERVE THE INDICATOR

- Key in ON position.
- Start the vehicle. Observe the powertrain malfunction (wrench) warning indicator.
- **Does the powertrain malfunction (wrench) indicator illuminate during the bulb prove-out?**

  YES : Go to U2.

  NO : Go to U12.

U2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any PCM DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article to continue diagnosis of the DTCs.

NO : Go to U3.

U3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND TCM SELF-TESTS

- Check for recorded TCM DTCs from the continuous and on-demand self-tests.
- **Are any TCM DTCs recorded?**

  YES : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

  NO : If equipped with AWD, go to U4.

  If not equipped with AWD, go to U5.

U4 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND 4X4 CONTROL MODULE SELF-TESTS

- Check for recorded 4X4 control module DTCs from the continuous and on-demand self-tests.
- **Are any 4X4 control module DTCs recorded?**

  YES : REFER to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article.

  NO : Go to U5.

U5 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) powertrain malfunction (wrench) indicator (ETC_IND) active command. Command the powertrain malfunction (wrench) warning indicator active command on and off. Observe the indicator.
- **Does the powertrain malfunction (wrench) warning indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to U6.

  NO : Go to U12.

U6 CHECK THE INSTRUMENT CLUSTER (IC) TCM WRENCH REQUEST PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select and monitor the instrument cluster (IC) TCM wrench request (WR_LMP_TCM) PID.
- **Does the TCM wrench request PID read YES?**

  YES : Go to U9.

  NO : Go to U7.

U7 CHECK THE INSTRUMENT CLUSTER (IC) ELECTRONIC THROTTLE CONTROL WRENCH REQUEST PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select and monitor the instrument cluster (IC) electronic throttle control wrench request

(WR_LMP_ETC) PID.

- **Does the electronic throttle control wrench request PID read YES?**

  YES : Go to U10.

  NO : If equipped with four wheel drive (4WD), go to U8.

  If not equipped with 4WD, go to U12.

U8 CHECK THE INSTRUMENT CLUSTER (IC) 4X4 CONTROL MODULE WRENCH REQUEST PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select and monitor the instrument cluster (IC) 4X4 control module wrench request (WR_LMP_4X4M) PID.
- **Does the 4X4 control module control wrench request PID read YES?**

  YES : Go to U11.

  NO : Go to U12.

U9 CHECK FOR CORRECT TCM OPERATION

- Disconnect all the TCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the TCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new TCM. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

U10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article,

ELECTRONIC ENGINE CONTROLS - 3.0L (4V) article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

U11 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect all the 4X4 control module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the 4X4 control module connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

U12 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test V: The Check Fuel Cap Warning Indicator Is Never/Always On

Normal Operation

The PCM monitors the fuel tank evaporative emission system for significant leaks that occur following refueling of the vehicle. Once the PCM detects a fuel vapor leak, the PCM sends the instrument cluster (IC) a message over the communication network to turn on the check fuel cap warning indicator. DTC P0457 sets in the PCM following a successful cruise test, which is initiated when the vehicle is driven at a steady speed above 64 km/h (40 mph) for a duration of approximately 4-5 minutes. If the PCM is unable to successfully run the cruise test, the instrument cluster (IC) does not receive the check fuel cap message and the check fuel cap indicator remains off.

- DTC P0457 (Evaporative Emission System Leak Detected [fuel cap loose/off]) - sets in the PCM if a fuel tank pressure change greater than -23.7 kPa (-7 in-Hg) of vacuum within 30 seconds after refueling occurs, or there is an excessive purge (fuel vapor) flow of greater than 454 g (1.0 lb) per minute.

This pinpoint test is intended to diagnose the following:

- PCM
- Instrument cluster (IC)

PINPOINT TEST V: THE CHECK FUEL CAP INDICATOR IS NEVER/ALWAYS ON

V1 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the check fuel cap indicator (FUEL_CAP) active command. Command the check fuel cap indicator on and off. Observe the check fuel cap indicator.
- **Does the check fuel cap indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to V2.

  NO : Go to V5.

V2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Is DTC P0457 recorded?**

  YES : If the check fuel cap indicator is illuminated, REFER to the **Introduction - Gasoline Engines** article.

  If the check fuel cap indicator is not illuminated, go to V3.

  NO : If the check fuel cap indicator is always on, go to V5.

  If the check fuel cap indicator is not illuminated, the system is operating normally at this time. If the fuel cap was left off and the check fuel cap warning indicator did not turn on, driving conditions may not have allowed for the PCM to run the cruise test and message the instrument cluster (IC) to turn on the check fuel cap warning indicator.

V3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded continuous memory instrument cluster (IC) DTCs.
- **Is DTC U1900 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the PCM.

  NO : Go to V4.

V4 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

V5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test W: The Speed Control Indicator Is Never/Always On

Normal Operation

The speed control status information is sent to the instrument cluster (IC) from the PCM over the communication network.

This pinpoint test is intended to diagnose the following:

- PCM
- Instrument cluster (IC)

PINPOINT TEST W: THE SPEED CONTROL INDICATOR IS NEVER/ALWAYS ON

W1 CHECK THE SPEED CONTROL OPERATION

- Test drive the vehicle and operate the speed control.
- **Does the speed control operate correctly?**

  YES : Go to W2.

  NO : REFER to **SPEED CONTROL** article.

W2 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) speed control indicator (SC_SET) active command. Command the speed control indicator on and off. Observe the speed control indicator.
- **Does the speed control indicator illuminate when command on, and turn off when command off?**

  YES : Go to W3.

  NO : Go to W4.

W3 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

W4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the

system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test X: The Traction Assist Indicator Is Never/Always On

Normal Operation

When the PCM senses a traction assist event is taking place, it sends the instrument cluster (IC) a message over the communication network to illuminate the traction assist indicator or to flash the traction assist indicator. The traction assist indicator informs the driver that a traction assist event is taking place, by flashing the indicator. It is also used to indicate a malfunction in the traction assist system, or if the traction assist control has been disabled by the operator, by illuminating the indicator constantly (not flashing).

This pinpoint test is intended to diagnose the following:

- Traction assist system
- PCM
- Instrument cluster (IC)

PINPOINT TEST X: THE TRACTION ASSIST INDICATOR IS NEVER/ALWAYS ON

X1 CHECK THE TRACTION ASSIST INDICATOR OPERATION USING THE TRACTION ASSIST DISABLE SWITCH

- Key in ON position.
- Press the traction assist disable switch to disable the traction assist system while monitoring the traction assist indicator.
- **Does the traction assist indicator illuminate?**

YES : If the traction assist indicator does not operate while in traction active mode, go to X5.

If the traction assist indicator operates in traction active mode, the system is operating normally at this time.

NO : Go to X2.

X2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded instrument cluster (IC) DTCs from the continuous and on-demand self-tests.
- **Are any instrument cluster (IC) DTCs recorded?**

YES : For DTC C1093, REFER to **VEHICLE DYNAMIC SYSTEMS** article.

For DTC U1900 or U1901, REFER to **MODULE COMMUNICATIONS NETWORK** article.

For all other DTCs, REFER to **DTC Charts**.

NO : Go to X3.

X3 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) traction control indicator (CHECK_TRACT) active command. Command the traction assist lamp on and off. Observe the traction assist indicator.
- **Does the traction assist indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to X4.

  NO : Go to X6.

X4 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS

- Check for recorded PCM DTCs from the continuous and on-demand self-tests.
- **Are any PCM DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article.

  NO : Go to X5.

X5 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

X6 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Y: The Charging System Warning Indicator Is Never/Always On

Normal Operation

The charging system warning indicator is controlled by the instrument cluster (IC) based upon data received from the PCM over the communication network.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- PCM
- Instrument cluster (IC)

PINPOINT TEST Y: THE CHARGING SYSTEM WARNING INDICATOR IS NEVER/ALWAYS ON

Y1 CHECK THE CHARGING SYSTEM OPERATION

- Check the charging system operation. Refer to **CHARGING SYSTEM - GENERAL INFORMATION** article.
- **Is the charging system operating correctly?**

  YES : Go to Y2.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.

Y2 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) charging system warning indicator (CHARGE_LMP) active command. Command the charging system warning indicator active command on and off. Observe the charging system warning indicator.
- **Does the charging system warning indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to Y3.

  NO : Go to Y4.

Y3 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Y4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Z: The O/D OFF Indicator Is Never/Always On

Normal Operation

The transmission control module (TCM) monitors the overdrive (O/D) off switch status. When the O/D function is selected off, the TCM sends a message to the instrument cluster (IC) over the communication network to turn on the O/D OFF indicator.

This pinpoint test is intended to diagnose the following:

- TCM
- Instrument cluster (IC)

PINPOINT TEST Z: THE O/D OFF INDICATOR IS NEVER/ALWAYS ON

Z1 CHECK THE OPERATION OF THE O/D OFF FUNCTION

- Test drive the vehicle while turning the O/D function on and off.
- **Does the O/D function correctly?**

  YES : Go to Z2.

  NO : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

Z2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND TCM SELF-TESTS

- Check for recorded TCM DTCs from the continuous and on-demand self-tests.
- **Are any TCM DTCs recorded?**

  YES : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

  NO : Go to Z3.

Z3 CARRY OUT THE INSTRUMENT CLUSTER (IC) INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) Active Command
- Select the instrument cluster (IC) indicator lamp control active command ALL_LAMP. Command all the lamps on and off. Observe the O/D OFF indicator.
- **Does the O/D OFF indicator illuminate when commanded on, and turn off when commanded off?**

  YES : Go to Z4.

  NO : Go to Z5.

Z4 CHECK FOR CORRECT TCM OPERATION

- Disconnect all the TCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the TCM connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new TCM. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Z5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AA: DTC B1318 - Battery Voltage Low

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster (IC) sets DTC B1318 in continuous memory and on-demand if the instrument cluster (IC) detects low battery voltage on the B+ keep alive voltage input, circuit SBP26 (YE/RD).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- Instrument cluster (IC)

PINPOINT TEST AA: DTC B1318 - BATTERY VOLTAGE LOW

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

AA1 RECHECK THE INSTRUMENT CLUSTER (IC) DTCs

- Verify that the battery is fully charged. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Clear the DTCs. Repeat the instrument cluster (IC) self-test.
- **Is DTC B1318 still present?**

  YES : Go to AA2.

  NO : The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.

AA2 CHECK THE INSTRUMENT CLUSTER (IC) VOLTAGE SUPPLY

- Key in OFF position.
- Disconnect: Instrument Cluster C220
- Key in ON position.

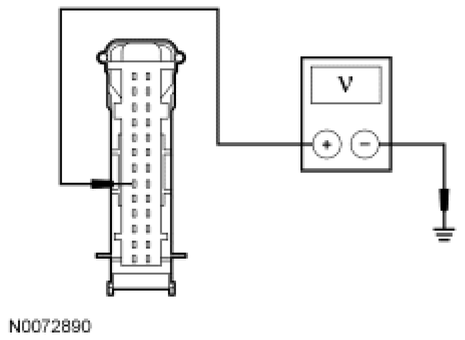

Fig. 40: Checking Instrument Cluster (IC) Voltage Supply
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-6, circuit CBP23 (BN/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to AA3.

  NO : REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.

AA3 CHECK THE INSTRUMENT CLUSTER (IC) GROUND CIRCUITS

- Key in OFF position.

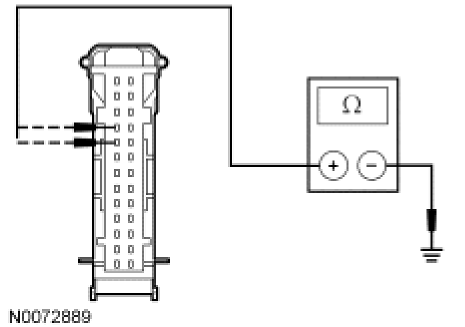

Fig. 41: Checking Instrument Cluster (IC) Ground Circuits
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-9, circuit GD116 (BK/VT), harness side and ground; and between the instrument cluster (IC) C220-10, circuit GD116 (BK/VT), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : Go to AA4.

  NO : REPAIR the circuit for high resistance. TEST the system for normal operation.

AA4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion

    - damaged pins
    - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AB: DTC B2844 - Ignition Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

With the ignition switch in the START or RUN position, the instrument cluster (IC) receives voltage from the smart junction box (SJB) through circuit CBP20 (YE/VT). When the ignition switch is turned to the OFF or ACC position, the voltage drops to 0 volts on circuit CBP20 (YE/VT). The instrument cluster (IC) sets DTC B2844 in continuous memory if the instrument cluster (IC) detects voltage on circuit CBP20 (YE/VT) with the ignition switch in the ACC position or if no voltage is supplied by the key-in-ignition switch on circuit CDC30 (BU/GY) with the ignition in the START, RUN or ACC positions.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- Instrument cluster (IC)

PINPOINT TEST AB: DTC B2844 - IGNITION FAULT

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

AB1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS

- Check for recorded instrument cluster (IC) DTCs from the continuous and on-demand self-tests.
- **Is DTC B1352 recorded?**

  YES : Go to **Pinpoint Test AI**.

  NO : Go to AB2.

AB2 CHECK CIRCUIT CBP20 (YE/VT) FOR VOLTAGE WITH THE IGNITION SWITCH IN THE ACC POSITION

- Key in OFF position.
- Disconnect: Instrument Cluster (IC) C220
- Key in ACCESSORY position.

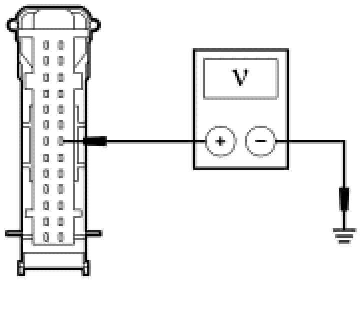

Fig. 42: Checking Circuit CBP20 (YE/VT) For Voltage With Ignition Switch In ACC Position
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-20, circuit CBP20 (YE/VT), harness side and ground.
- **Is the voltage greater than 10 volts with the ignition switch in the ACC position?**

  YES : REFER to **STEERING COLUMN SWITCHES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to AB3.

AB3 CHECK CIRCUIT CBP20 (YE/VT) FOR VOLTAGE WITH THE IGNITION SWITCH IN THE RUN OR START POSITION

- Key in OFF position.
- Disconnect: PCM Power Relay
- Key in ON position.

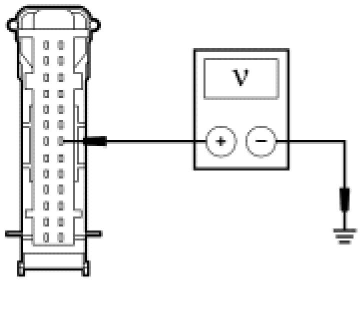

Fig. 43: Checking Circuit CBP20 (YE/VT) For Voltage With Ignition Switch In Run Or Start Position
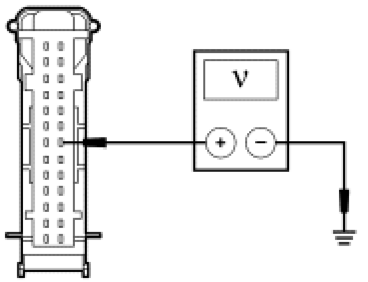
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-20, circuit CBP20 (YE/VT), harness side and ground.

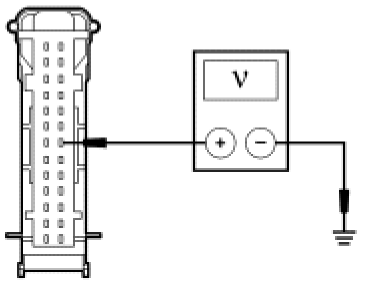
- Place the ignition switch in the START postion.



N0026982

Fig. 44: Measuring Voltage Between Instrument Cluster (IC) C220-20, Circuit CBP20 (YE/VT) (START Postion)
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-20, circuit CBP20 (YE/VT), harness side and ground.
- Key in OFF position.



N0026982

Fig. 45: Measuring Voltage Between Instrument Cluster (IC) C220-20, Circuit CBP20 (YE/VT) (OFF Postion)
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-20, circuit CBP20 (YE/VT), harness side and ground.
- **Is the voltage greater than 10 volts with the ignition switch in the RUN and the START position, and does the voltage drop to 0 volts when the ignition switch is turned to the OFF position?**

  YES : Go to AB4.

  NO : REFER to **STEERING COLUMN SWITCHES** article to diagnose the ignition switch circuits.

AB4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion

  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AC: The Message Center Is Not Operating Correctly

Normal Operation

The message center displays information about total odometer, trip odometers and compass information after instrument cluster (IC) prove-out. With the ignition in the ON position, the message center displays important vehicle information through a constant monitoring of vehicle systems. Pressing the message center switch notifies the operator of potential vehicle conditions with a display of system warnings.

This pinpoint test is intended to diagnose the following:

- Message center switch concern
- Instrument cluster (IC)

PINPOINT TEST AC: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

AC1 CHECK THE MESSAGE CENTER DISPLAY OPERATION USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) display segment (SEGMENTS_2) active command. Command the display segments on. Observe the message center display.
- **Does the message center display illuminate all segments?**

  YES : The system is OK. If the SET, INFO or RESET buttons are inoperative, go to **Pinpoint Test AD**.

  NO : Go to AC2.

AC2 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AD: The Message Center Switch Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The message center switch is hardwired to the instrument cluster (IC) through circuits CMC29 (GN/VT) and RMC27 (WH/BN). To communicate the requested switch function, each message center switch button uses a different resistance value, allowing the instrument cluster (IC) to determine which switch is pressed.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Message center switch
- Instrument cluster (IC)

PINPOINT TEST AD: THE MESSAGE CENTER SWITCH DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

AD1 CHECK THE INSTRUMENT CLUSTER (IC) PID FOR THE MESSAGE CENTER SWITCH USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select and monitor the instrument cluster (IC) message center switch INFO (INFO), SETUP (SETUPSW) and RESET (RES_SW) PIDs while pressing each message center switch (INFO, SETUP, and RESET).
- **Do the PIDs agree with the switch position?**

  YES : Go to AD6.

  NO : Go to AD2.

AD2 CHECK CIRCUITS CMC29 (GN/VT) AND RMC27 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Instrument Cluster (IC) C220

- Disconnect: Message Center Switch C253
- Key in ON position.

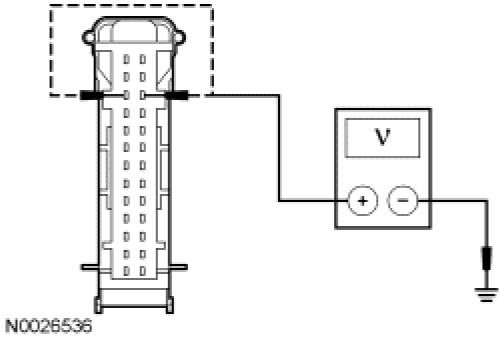


Fig. 46: Checking Circuits CMC29 (GN/VT) And RMC27 (WH/BN) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-24, circuit CMC29 (GN/VT), harness side and ground; and between the instrument cluster (IC) C220-11, circuit RMC27 (WH/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. TEST the system for normal operation.

  NO : Go to AD3.

AD3 CHECK CIRCUIT CMC29 (GN/VT) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

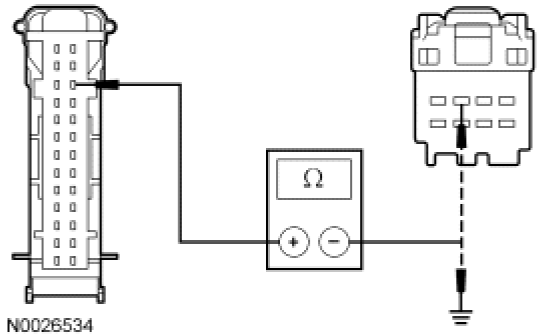

Fig. 47: Checking Circuit CMC29 (GN/VT) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-24, circuit CMC29 (GN/VT), harness side and the message center switch C253-3, circuit CMC29 (GN/VT), harness side; and between the instrument cluster (IC) C220-24, circuit CMC29 (GN/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the instrument cluster (IC) and the message center switch, and greater than 10,000 ohms between the instrument cluster (IC) and ground?**

  YES : Go to AD4.

  NO : REPAIR the circuit. TEST the system for normal operation.

AD4 CHECK CIRCUIT RMC27 (WH/BN) FOR AN OPEN OR SHORT TO GROUND

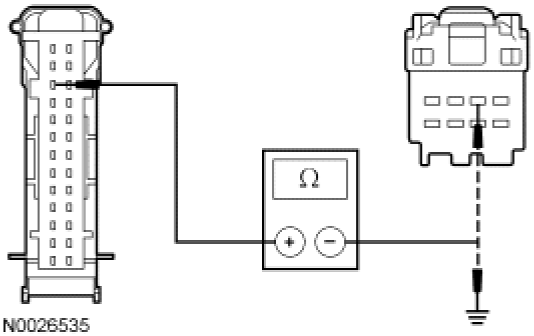

Fig. 48: Checking Circuit RMC27 (WH/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-11, circuit RMC27 (WH/BN), harness side and the message center switch C253-2, circuit RMC27 (WH/BN), harness side; and between the instrument cluster (IC) C220-11, circuit RMC27 (WH/BN), harness side and ground.
- **Is the resistance less than 5 ohms between the instrument cluster (IC) and the message center switch, and greater than 10,000 ohms between the instrument cluster (IC) and ground?**

  YES : Go to AD5.

  NO : REPAIR the circuit. TEST the system for normal operation.

AD5 CHECK FOR VOLTAGE FROM THE INSTRUMENT CLUSTER (IC)

- Connect: Instrument Cluster (IC) C220
- Key in ON position.

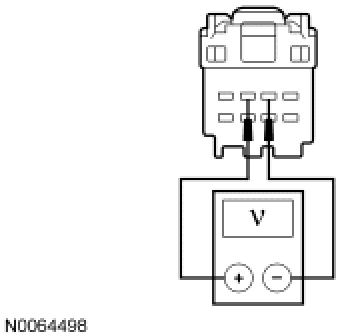

Fig. 49: Checking For Voltage From Instrument Cluster (IC)
Courtesy of FORD MOTOR CO.

- Measure the voltage between the message center switch C269-3, circuit CMC29 (GN/VT), harness side and the message center switch C269-2, circuit RMC27 (WH/BN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new message center switch. REFER to **Message Center Switch**. TEST the system for normal operation.

  NO : Go to AD6.

AD6 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AE: The Compass Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The compass module (early build) receives voltage from the smart junction box (SJB) through circuit CBP19 (BN/WH) or the auto-dimming interior mirror (late build) receives voltage from the SJB through circuit CBP02 (GN). The compass module (early build) or the interior rear view mirror (late build) is grounded through circuit GD139 (BK/YE). The compass module (early build) or auto-dimming interior mirror (late build) communicates the vehicle direction to the instrument cluster (IC) through circuits VMC30 (BU/GY) and VMC31 (YE/GN) and the direction is displayed in the instrument cluster (IC).

- DTC U2013 (Compass Module is Not Responding) - is a continuous DTC that sets if the instrument cluster (IC) does not receive compass data on circuits VMC30 (BU/GY) and VMC31 (YE/GN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Compass module (early build)
- Auto-dimming interior mirror (late build)

PINPOINT TEST AE: THE COMPASS IS INOPERATIVE

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

AE1 CHECK CIRCUIT CBP19 (BN/WH) (EARLY BUILD) OR CBP02 (GN) (LATE BUILD) FOR BATTERY VOLTAGE

- Key in OFF position.
- Disconnect: Compass Module (Early Build) C909
- Disconnect: Auto-Dimming Interior Mirror (Late Build) C911 or C9030
- Key in ON position.
- Measure the voltage between the compass module (early build) or auto-dimming interior mirror (late build), harness side and ground as follows:

Component	Connector-Pin	Circuit
Early Build		
Compass module	C909-3	CBP19 (BN/WH)
Late Build		
Auto-dimming interior mirror (without microphone)	C911-1	CBP02 (GN)
Auto-dimming interior mirror (with microphone)	C9030-1	CBP02 (GN)

- **Is the voltage greater than 10 volts?**

  YES : Go to AE2.

  NO : VERIFY the SJB fuse 28 (10A) (early build) or 12 (7.5A) (late build) is OK. If OK, REPAIR the circuit for an open. CLEAR the DTCs. REPEAT the self-test.

AE2 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the compass module (early build) or the auto-dimming interior mirror (late build), harness side and ground as follows:

Component	Connector-Pin	Circuit
Early Build		
Compass module	C909-4	GD139 (BK/YE)
Late Build		
Auto-dimming interior mirror (without microphone)	C911-3	GD139 (BK/YE)
Auto-dimming interior mirror (with microphone)	C9030-10	GD139 (BK/YE)

- **Is the resistance less than 5 ohms?**

  YES : Go to AE3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

AE3 CHECK CIRCUIT VMC30 (BU/GY) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: Instrument Cluster (IC) C220

- Measure the resistance between the compass module (early build) or the interior rear view mirror (late build), harness side and the instrument cluster (IC), harness side; and between the compass module (early build) or the interior rear view mirror (late build), harness side and ground.

Component	Connector-Pin	Instrument Cluster Connector-Pin	Circuit
Early Build			
Compass module	C909-2	C220-17	VMC30 (BU/GY)
Late Build			
Auto-dimming interior mirror (without microphone)	C911-7	C220-17	VMC30 (BU/GY)
Auto-dimming interior mirror (with microphone)	C9030-2	C220-17	VMC30 (BU/GY)

- **Is the resistance less than 5 ohms between the compass module (early build) or the auto-dimming interior mirror (late build) and the instrument cluster (IC), and greater than 10,000 ohms between the compass module (early build) or the auto-dimming interior mirror (late build) and ground?**

  YES : Go to AE4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

AE4 CHECK CIRCUIT VMC31 (YE/GN) FOR AN OPEN OR SHORT TO GROUND

- Measure the resistance between the compass module (early build) or the interior rear view mirror (late build), harness side and the instrument cluster (IC), harness side; and between the compass module (early build) or the interior rear view mirror (late build), harness side and ground.

Component	Connector-Pin	Instrument Cluster Connector-Pin	Circuit
Early Build			
Compass module	C909-1	C220-16	VMC31 (YE/GN)
Late Build			
Auto-dimming interior mirror (without microphone)	C911-6	C220-16	VMC31 (YE/GN)
Auto-dimming interior mirror (with microphone)	C9030-6	C220-16	VMC31 (YE/GN)

- **Is the resistance less than 5 ohms between the compass module (early build) or the interior rear view mirror (late build) and the instrument cluster (IC), and greater than 10,000 ohms between the compass module (early build) or the interior rear view mirror (late build) and ground?**

  YES : On early build vehicles, INSTALL a new compass module.

  On late build vehicles, INSTALL a new auto-dimming interior mirror. REFER to **REAR VIEW**

MIRRORS article.

SET the zone. REFER to **Compass Zone Adjustment**. CALIBRATE the compass. REFER to **Compass Calibration**. CLEAR the DTCs. REPEAT the self-test.

If the compass is still inoperative, go to AE5.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

AE5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AF: The Compass Is Inaccurate

Normal Operation

The compass sensor module (early build) or the auto-dimming interior mirror (late build) communicates the vehicle direction to the instrument cluster (IC) through the compass communication data plus circuit VMC31 (YE/GN) and compass communication data minus circuit VMC30 (BU/GY). The magnetic fields generated by the earths north and south poles are divided into zones that differ from each other with respect to how the magnetic fields appear. The magnetic north can change by up to 4 degrees between zones and become noticeable across multiple zones. The compass zone must be set to the correct zone for the compass to read accurately. Factors within the vehicle may affect the ability of the compass module to accurately read the magnetic north. Calibrating the compass allows the compass module to compensate for vehicle factors that influence the accuracy of the compass.

This pinpoint test is intended to diagnose the following:

- Vehicle magnetization
- Zone setting
- Calibration
- Compass module (early build)
- Auto-dimming interior mirror (late build)

PINPOINT TEST AF: THE COMPASS IS INACCURATE

AF1 CHECK THE COMPASS ZONE SETTING AND CALIBRATION

- Set the zone. Refer to **Compass Zone Adjustment**.
- Calibrate the compass. Refer to **Compass Calibration**.
- **Does the compass calibrate correctly?**

  YES : Go to AF3.

  NO : Go to AF2.

AF2 DEMAGNETIZE THE VEHICLE

- Demagnetize the vehicle. Refer to **Vehicle Demagnetizing**.
- **Does the compass operate correctly?**

  YES : Go to AF3.

  NO : On early build vehicles, INSTALL a new compass module. On late build vehicles, INSTALL a new auto-dimming interior mirror. REFER to **REAR VIEW MIRRORS** article. SET the zone. REFER to **Compass Zone Adjustment**. CALIBRATE the compass. REFER to **Compass Calibration**. TEST the system for normal operation.

AF3 CHECK COMPASS ACCURACY

- Position the vehicle and observe the compass display as follows:

Vehicle Direction	Compass Display
North	N
Northeast	NE
East	E
Southeast	SE
South	S
Southwest	SW
West	W
Northwest	NW

- **Does the compass display as indicated?**

  YES : The compass is OK.

  NO : On early build vehicles, INSTALL a new compass module. On late build vehicles, INSTALL a new auto-dimming interior mirror. REFER to **REAR VIEW MIRRORS** article. SET the zone. REFER to **Compass Zone Adjustment**. CALIBRATE the compass. REFER to **Compass Calibration**. TEST the system for normal operation.

Pinpoint Test AG: The DRIVER DOOR, PASSENGER DOOR, REAR LEFT DOOR, REAR RIGHT DOOR or TRUNK AJAR Warning Message Is Inoperative

Normal Operation

The DRIVER DOOR, PASSENGER DOOR, REAR LEFT DOOR, REAR RIGHT DOOR or TRUNK AJAR

warning informs the driver if any of the vehicle doors are not completely closed. The information is sent from the smart junction box (SJB) to the instrument cluster (IC) over the communication network.

This pinpoint test is intended to diagnose the following:

- SJB
- Instrument cluster (IC)

PINPOINT TEST AG: THE DRIVER DOOR, PASSENGER DOOR, REAR LEFT DOOR, REAR RIGHT DOOR OR TRUNK AJAR WARNING MESSAGE IS INOPERATIVE

AG1 CHECK THE OPERATION OF THE INTERIOR LAMPS

- Open and close each door and the luggage compartment lid while monitoring the interior lamps.
- **Do the interior lamps operate correctly?**

  YES : Go to AG2.

  NO : REFER to **INTERIOR LIGHTING** article.

AG2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER (IC) SELF-TEST

- Check for recorded instrument cluster (IC) DTCs from the continuous self-test.
- **Is DTC U1901 recorded?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose communication with the SJB.

  NO : Go to AG3.

AG3 CARRY OUT THE INSTRUMENT CLUSTER (IC) DISPLAY SEGMENT COMMAND USING THE SCAN TOOL

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) display segment (SEGMENTS_2) active command. Command the display segments on.
- **Do the instrument cluster (IC) display segments illuminate?**

  YES : Go to AG4.

  NO : Go to AG5.

AG4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

AG5 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AH: The LOW FUEL LEVEL Warning Message Is Inoperative

Normal Operation

The LOW FUEL LEVEL warning is displayed when the fuel level reaches a predetermined level of approximately 1/8 tank. The LOW FUEL LEVEL warning display and the fuel gauge are controlled by the instrument cluster (IC) based upon the distance until empty (DTE) calculated internally by the instrument cluster (IC) from data received from the PCM and fuel gauge. When the instrument cluster (IC) receives the data, the fuel gauge indicates low fuel and the instrument cluster (IC) displays LOW FUEL LEVEL.

This pinpoint test is intended to diagnose the following:

- Fuel gauge
- Instrument cluster (IC)

PINPOINT TEST AH: THE LOW FUEL LEVEL WARNING MESSAGE IS INOPERATIVE

AH1 CHECK THE FUEL GAUGE OPERATION

- Key in ON position.
- Access and observe the message center distance to empty (DTE) displayed mileage.
- **Does the DTE display indicate 80 km (50 miles) or less until empty?**

  YES : Go to AH2.

  NO : The system is operating correctly at this time. The low fuel warning message does not appear until the DTE is 80 km (50 miles) or less.

AH2 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AI: The Key-In-Ignition Warning Chime Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

When the key is inserted into the ignition cylinder, the key-in-ignition warning switch (part of the ignition switch) closes providing voltage on circuit CDC30 (BU/GY) to the instrument cluster (IC). The voltage input signals the instrument cluster (IC) that the key is inserted. Door ajar status is communicated to the instrument cluster (IC) from the smart junction box (SJB) through the controller area network (CAN). If the instrument cluster (IC) detects that the ignition lock cylinder is in the OFF or ACC position, the key is inserted in the ignition cylinder, and the SJB communicates to the instrument cluster (IC) that the driver door is ajar, the key-in-ignition warning chime sounds.

- DTC B1352 (Ignition Key-In Circuit Failure) - is a continuous DTC that sets in the instrument cluster (IC) if the instrument cluster (IC) does not sense voltage applied on circuit CDC30 (BU/GY) with voltage applied to circuit CBP23 (BN/YE) or CBP20 (YE/VT).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition warning switch (part of the ignition switch)
- Instrument cluster (IC)

PINPOINT TEST AI: THE KEY-IN-IGNITION WARNING CHIME IS INOPERATIVE

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

AI1 CHECK THE RECORDED INSTRUMENT CLUSTER (IC) DTCs FROM BOTH THE

CONTINUOUS AND ON-DEMAND SELF-TESTS

- Check the recorded instrument cluster (IC) DTCs from the continuous and on-demand self-tests.
- **Is DTC B1352 recorded?**

  YES : Go to AI4.

  NO : Go to AI2.

AI2 CARRY OUT THE INSTRUMENT CLUSTER (IC) WARNING LAMPS AND CHIME ACTIVE COMMAND

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster (IC) DataLogger
- Select the instrument cluster (IC) chime (CHIME) active command. Command the chime on.
- **Does the chime sound?**

  YES : Go to AI3.

  NO : Go to AI6.

AI3 CHECK THE DOOR AJAR INDICATOR

- Make sure all the doors are closed.
- While observing the message center (if equipped) or the door ajar warning indicator, open the driver door.
- **Is the DRIVER DOOR AJAR message displayed on the message center (if equipped) or the door ajar warning indicator illuminated with the driver door open?**

  YES : Go to AI5.

  NO : If not equipped with a message center, go to **Pinpoint Test O**.

  If equipped with a message center, go to **Pinpoint Test AG**.

AI4 CHECK CIRCUIT CDC30 (BU/GY) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Instrument Cluster (IC) C220
- Insert the key in to the lock cylinder.
- Measure the voltage between the instrument cluster (IC) C220-7, circuit CDC30 (BU/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to AI6.

  NO : Go to AI5.

AI5 CHECK CIRCUIT CDC30 (BU/GY) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: Ignition Switch C250

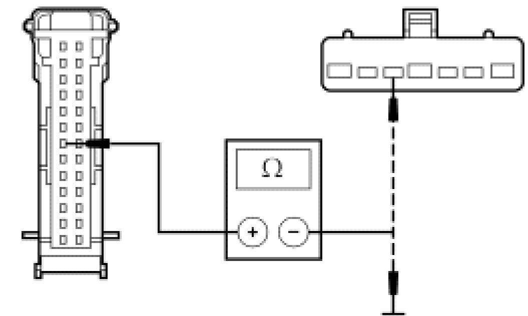

Fig. 50: Checking Circuit CDC30 (BU/GY) For Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the instrument cluster (IC) C220-7, circuit CDC30 (BU/GY), harness side and the ignition switch C250-5, circuit CDC30 (BU/GY), harness side; and between the instrument cluster (IC) C220-7, circuit CDC30 (BU/GY), harness side and ground.
- **Is the resistance less than 5 ohms between the instrument cluster (IC) and the ignition switch, and greater than 10,000 ohms between the instrument cluster (IC) and ground?**

  YES : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

AI6 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AJ: The Headlamps On Warning Chime Is Inoperative

Normal Operation

The headlamps on warning chime sounds when the driver door is opened with the ignition lock cylinder in the OFF position, the key not in the ignition lock cylinder, and the headlamp switch in the PARK or HEADLAMP positions. The smart junction box (SJB) provides the headlamps on status and the driver door ajar status to the instrument cluster (IC) over the medium speed controller area network (MS-CAN) communication bus. The autolamps feature must not be selected for the headlamps on warning chime to operate.

This pinpoint test is intended to diagnose the following:

- Instrument cluster (IC)

PINPOINT TEST AJ: THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

AJ1 CHECK THE EXTERIOR LAMPS

- Turn the headlamp switch to the PARKING LAMP position.
- **Do the parking lamps illuminate with the headlamp switch in the PARKING LAMP position?**

  YES : Go to AJ2.

  NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the exterior lamps.

AJ2 CHECK THE DOOR AJAR INDICATOR

- Key in OFF position.
- Make sure all the doors are closed.
- Key in ON position.
- While observing the message center (if equipped) or the door ajar warning indicator, open the driver door.
- **Is the DRIVER DOOR AJAR message displayed on the message center (if equipped) or the door ajar warning indicator illuminated with the driver door open?**

  YES : Go to AJ3.

  NO : If not equipped with a message center, go to **Pinpoint Test O**.

  If equipped with a message center, go to **Pinpoint Test AG**.

AJ3 CHECK THE INSTRUMENT CLUSTER (IC) ILLUMINATION FOR CORRECT OPERATION

- Turn the headlamp switch to the PARKING LAMP position.
- **Does the instrument cluster (IC) illumination operate correctly?**

  YES : Go to AJ4.

  NO : REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article.

AJ4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AK: The Turn Signal Left On Reminder Chime Is Inoperative

Normal Operation

The turn signal left on reminder chime sounds when the vehicle travels more than 3.2 km (2.0 miles) with the turn signal on. The smart junction box (SJB) communicates the turn signal switch status to the instrument cluster (IC) over the controller area network (CAN). The PCM communicates the odometer count data to the instrument cluster (IC) over the CAN.

This pinpoint test is intended to diagnose the following:

- Instrument cluster (IC)

PINPOINT TEST AK: THE TURN SIGNAL LEFT ON WARNING CHIME IS INOPERATIVE

AK1 CHECK THE TURN SIGNAL INDICATORS OPERATION

- Key in ON position.
- Verify the turn signal indicators operation.
- **Do the turn signal indicators operate correctly?**

  YES : Go to AK2.

  NO : Go to **Pinpoint Test Q**.

AK2 CHECK THE ODOMETER FOR CORRECT OPERATION

- Drive the vehicle and observe the odometer for correct operation.
- **Does the odometer operate correctly?**

  YES : Go to AK3.

  NO : Go to **Pinpoint Test F**.

AK3 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AL: The Chime Sounds When The Driver Door Is Ajar (No Key In Ignition And Headlamps Off)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

When the key is inserted into the ignition lock cylinder, the key-in-ignition warning switch (part of the ignition switch) closes providing voltage on circuit CDC30 (BU/GY) to the instrument cluster (IC). The voltage input signals the instrument cluster (IC) that the key is inserted. Door ajar status is communicated to the instrument cluster (IC) from the smart junction box (SJB) through the controller area network (CAN). If the instrument cluster (IC) detects that the ignition lock cylinder is in the OFF or ACC position, the key is inserted in the ignition lock cylinder, and the SJB communicates to the instrument cluster (IC) that the driver door is ajar, the key-in-ignition warning chime sounds. The SJB communicates to the instrument cluster (IC) that the exterior lamps are on and the driver door is opened. The headlamps on warning chime sounds when the driver door is opened with the ignition lock cylinder in the OFF position, the key not in the ignition lock cylinder, and the multifunction switch in the PARKING LAMP or HEADLAMP positions.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition warning switch (part of the ignition switch)
- Instrument cluster (IC)

PINPOINT TEST AL: THE CHIME SOUNDS WHEN THE DRIVER DOOR IS AJAR (NO KEY IN IGNITION AND HEADLAMPS OFF)

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

AL1 CHECK THE EXTERIOR LAMPS

- Verify the exterior lamps operate correctly.
- **Do the exterior lamps operate correctly?**

  YES : Go to AL2.

  NO : REFER to **EXTERIOR LIGHTING** article.

AL2 CHECK THE IGNITION SWITCH

- Key in OFF position.
- Remove the key from the ignition lock cylinder.
- Disconnect: Instrument Cluster (IC) C220

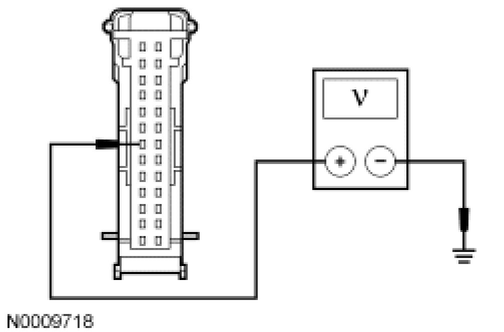

Fig. 51: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-7, circuit CDC30 (BU/GY), harness side and ground.
- **Is any voltage present?**

  YES : Go to AL3.

  NO : Go to AL4.

AL3 CHECK CIRCUIT CDC30 (BU/GY) FOR A SHORT TO VOLTAGE

- Disconnect: Ignition Switch C250

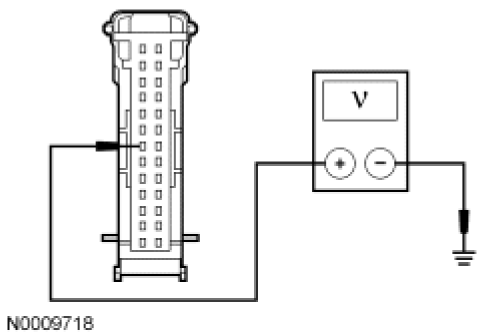

Fig. 52: Checking Circuit CDC30 (BU/GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the instrument cluster (IC) C220-7, circuit CDC30 (BU/GY), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

AL4 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins

    - pushed-out pins
  - Connect the instrument cluster (IC) connector and make sure it seats correctly.
  - Operate the system and verify the concern is still present.
  - **Is the concern still present?**

    YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

    NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AM: The Safety Belt Warning Chime Does Not Operate Correctly/The Belt-Minder® Feature Does Not Operate Correctly

Normal Operation

The instrument cluster (IC) receives the safety belt and Belt-Minder® requests from the restraints control module (RCM) over the high speed controller area network (HS-CAN). The safety belt warning chime sounds for approximately 6 seconds when the driver safety belt is not fastened and the ignition lock cylinder is turned from the OFF/LOCK or ACC to the ON or START position.

The Belt-Minder® feature supplements the safety belt warning function and is enabled after the safety belt warning is complete. The Belt-Minder® reminds the driver that the driver or passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster (IC) once the vehicle speed has exceeded 5 km/h (3 mph), and remains active for 5 minutes from the time it is started. While activated, the Belt-Minder® alternates the chime and indicator from on for 6 seconds to off for 30 seconds.

NOTE: Make sure that the safety belt/Belt-Minder® chime operation is verified with the vehicle moving at least 5 km/h (3 mph).

This pinpoint test is intended to diagnose the following:

- Safety belt warning indication concern
- Belt-Minder® deactivated
- Speedometer concern
- Instrument cluster (IC)

PINPOINT TEST AM: THE SAFETY BELT WARNING CHIME IS INOPERATIVE/THE BELT-MINDER® FEATURE DOES NOT OPERATE CORRECTLY

AM1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION

  - Key in OFF position.
  - With the ignition switch in the OFF position and the key in the ignition lock cylinder, open the LH front door and observe the key-in-ignition warning chime operation.
  - **Does the key-in-ignition warning chime operate correctly?**

    YES : Go to AM2.

NO : Go to AM6.

AM2 CHECK THE SAFETY BELT WARNING INDICATOR FOR CORRECT OPERATION

- Key in ON position.
- Buckle then unbuckle the LH front safety belt.
- Verify the safety belt warning indicator illuminates with the safety belt unbuckled and turns off when buckled.
- **Does the safety belt warning indicator operate correctly?**

  YES : Go to AM3.

  NO : Go to **Pinpoint Test L**.

AM3 CHECK THE SPEEDOMETER OPERATION

- Drive the vehicle and verify that the speedometer is operating correctly.
- **Does the speedometer operate correctly?**

  YES : Go to AM4.

  NO : Go to **Pinpoint Test F**.

AM4 CHECK THE BELT-MINDER® CONFIGURATION

- Verify that the Belt-Minder® is activated or configured on for the seating position in question. Refer to **Belt-Minder® Deactivating/Activating** to configure without a scan tool.
- **Is the Belt-Minder® activated for the seating position in question?**

  YES : Go to AM5.

  NO : ACTIVATE the Belt-Minder® for the seating position in question. REFER to **Belt-Minder® Deactivating/Activating**. TEST the system for normal operation.

AM5 CHECK FOR CORRECT RCM OPERATION

- Disconnect all the RCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the RCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new RCM. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

AM6 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect the instrument cluster (IC) connector.
- Check for:
  - corrosion
  - damaged pins

    - pushed-out pins
- Connect the instrument cluster (IC) connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster (IC). REFER to **Instrument Cluster (IC)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

GENERAL PROCEDURES

VEHICLE DEMAGNETIZING

NOTE:	During demagnetizing, the demagnetizer coil is pulled towards the vehicle. Place a cloth over the vehicle roof to protect the vehicle surface if contact occurs. Make sure the cloth covers the front third and the entire width of the roof.

NOTE:	The demagnetizing process requires the use of a demagnetizing coil commonly used by television repair technicians to demagnetize television tubes.

NOTE:	To demagnetize, use a constant circular motion over the vehicle roof. Do not turn off the demagnetizer while sweeping the vehicle roof to prevent remagnetizing ferrous materials contained in the vehicle.

NOTE:	During the demagnetizing process, make sure the phenolic surface of the tool (the side opposite the handle) is closest to the vehicle surface.

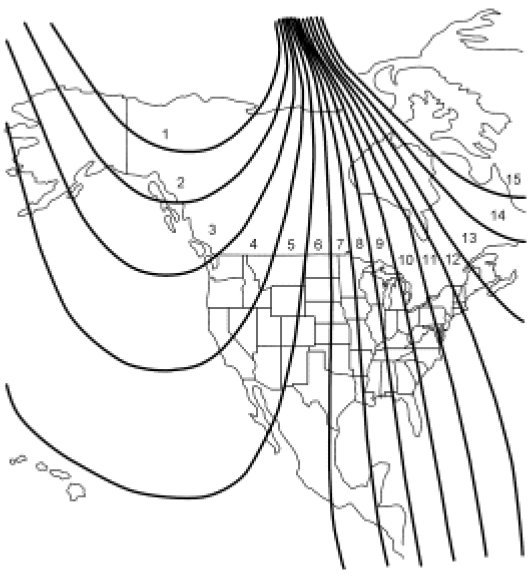
1. Demagnetize the front third of the vehicle roof.
    1. Turn on the demagnetizer at least 1 m (3 ft) away from the vehicle.
    2. Holding the demagnetizer no more than 2.5 cm (1 in) from the vehicle roof and starting on the passenger side, demagnetize the front third of the vehicle roof closest to the windshield using a constant circular motion. Keep the circle radius within 30 cm (12 in) while sweeping across the entire surface of the vehicle roof closest to the windshield. Continue the circular motion 4 times.
    3. After the fourth pass and without stopping, move the demagnetizer at least 1 m (3 ft) away from the vehicle.
    4. Turn the demagnetizer off.
2. Carry out the Compass Zone Adjustment procedure. For additional information, refer to **Compass Zone Adjustment**.
3. Carry out the Compass Calibration Adjustment procedure. For additional information, refer to **Compass Calibration**.

COMPASS ZONE ADJUSTMENT

1. Turn the ignition switch to the ON position.
2. Start the engine.

NOTE: The top of the message center must be blank. Do not select Trip, DTE, or AFE.

3. Press the message center switch INFO button repeatedly until the compass and the odometer are displayed in the message center.
4. Determine which magnetic zone you are in for your geographic location.



A0055128

Fig. 53: Compass Calibration Zone Map
Courtesy of FORD MOTOR CO.

5. Press and hold the RESET button until RESET FOR ZONE is displayed in the message center.
6. Release the RESET button and slowly press the RESET button down again.
7. Press the SETUP button repeatedly until the correct zone setting for your geographic location is displayed.
8. Press and release the RESET button to exit the zone setting mode and lock your individual zone.

COMPASS CALIBRATION

NOTE: For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater, A/C, map lamps, wipers, etc.)

and make sure all doors are closed.

1. Start the vehicle.
2. Press the RESET button until RESET FOR CAL/INFO TO EXIT is displayed in the message center display.

NOTE: This will take up to 3 circles to complete calibration.

3. Slowly drive the vehicle in a circle at no more than 5 km/h (3 mph) until SLOW CIRCLES TO CALIBRATE changes to CALIBRATION COMPLETED in the message center.
4. The compass is now calibrated.

BELT-MINDER® DEACTIVATING/ACTIVATING

Preparation

NOTE: The Belt-Minder® deactivating/activating can also be carried out using the scan tool.

1. Apply the parking brake before deactivating/activating the safety Belt-Minder®.
2. Place the gear selector lever in PARK (P) (automatic transaxle) or NEUTRAL (N) (manual transaxle).
3. Place the ignition switch in the OFF position.
4. Close all the vehicle doors.
5. Unbuckle the driver and the front passenger safety belts.

Deactivating/Activating

NOTE: The driver and front passenger Belt-Minder® are deactivated/activated independently.

1. Turn the ignition lock cylinder to the ON position (do not start the engine).
2. Wait until the safety belt warning lamp turns off (approximately 1 minute).

NOTE: Step 3 must be completed within 50 seconds after the safety belt warning indicator turns off.

3. For the seating position being disabled, at a moderate speed, buckle then unbuckle the safety belt 9 times, ending with the safety belt in the unbuckled state. After this step the safety belt warning indicator illuminates for 3 seconds.
4. Within 10 seconds of the safety belt warning indicator turning on, at a moderate speed, buckle then unbuckle the safety belt.
    - This disables the safety Belt-Minder® feature for that seating position, if it is currently enabled. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds.

- This enables the safety Belt-Minder® feature for that seating position, if it is currently disabled. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds, followed by 3 seconds with the indicator off, then the safety belt warning indicator flashes 4 times per second for 3 seconds again.

5. After confirmation, the deactivation/activation procedure is complete.

REMOVAL AND INSTALLATION

INSTRUMENT CLUSTER (IC)

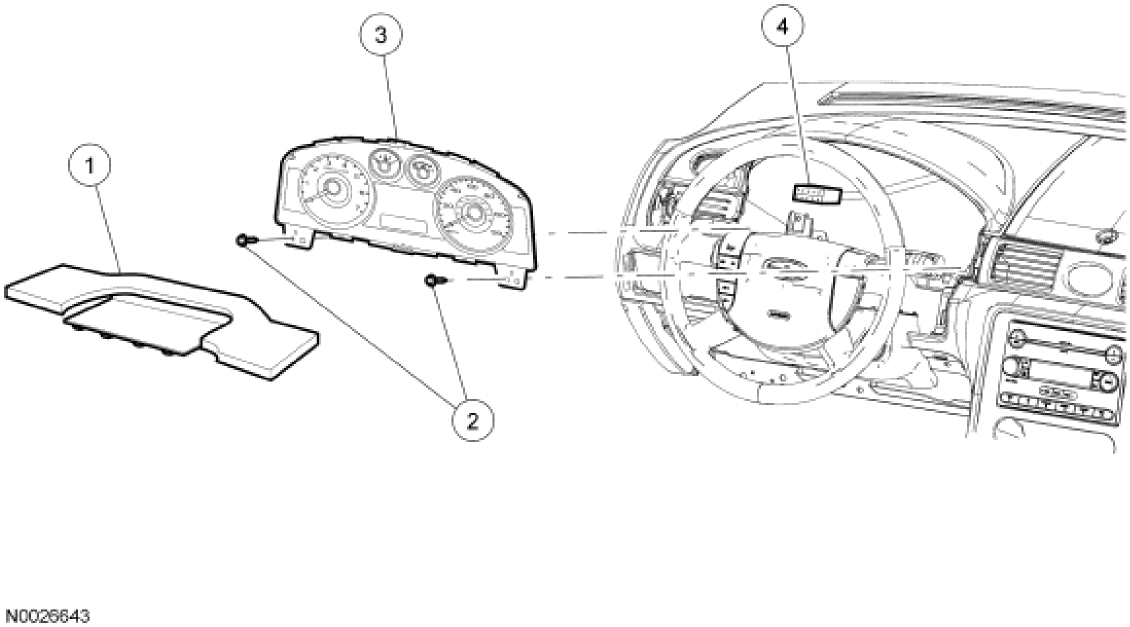


Fig. 54: Exploded View Of Instrument Cluster (IC) - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	54044D70	Instrument cluster (IC) finish panel
2	W705314	Instrument cluster (IC) screws (2 required)
3	10849	Instrument cluster (IC)
4	-	Instrument cluster (IC) electrical connector (part of 14401)

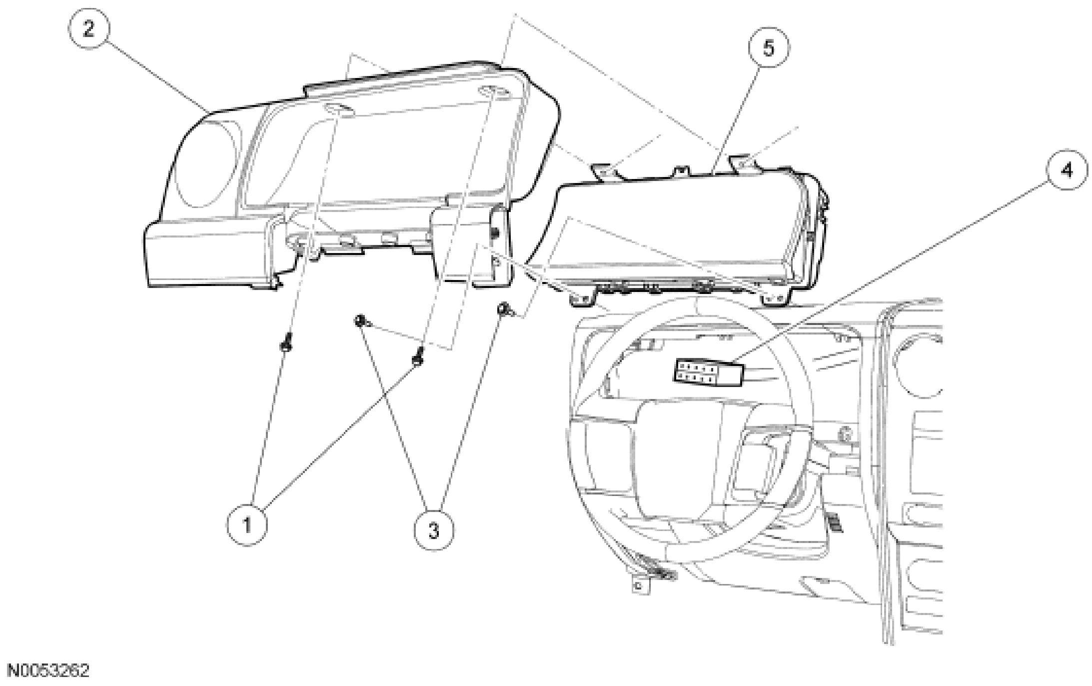

Fig. 55: Exploded View Of Instrument Cluster (IC) - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W70534	Instrument cluster (IC) finish panel screws (2 required)
2	54044D70	Instrument cluster (IC) finish panel
3	W705314	Instrument cluster (IC) screws (2 required)
4	-	Instrument cluster (IC) electrical connector (part of 14401)
5	10849	Instrument cluster (IC)

REMOVAL

All vehicles

1. If installing a new instrument cluster (IC), upload the module configuration to the scan tool. For additional information, refer to **MODULE CONFIGURATION** article, programmable module installation (PMI).
2. Tilt the steering column to the lowest position.

   MKZ

3. Remove the 2 instrument cluster (IC) finish panel screws and the instrument cluster (IC) finish panel.
4. Remove the 2 screws and the instrument cluster (IC).

- Disconnect the electrical connector.

Fusion, Milan

NOTE: **The instrument cluster (IC) finish panel is held in place by spring clips located on the finish panel.**

5. Remove the instrument cluster (IC) finish panel.

NOTE: **The top of the instrument cluster (IC) is a snap fit to the instrument panel. To ease removal of the instrument cluster (IC) insert a suitable tool between the instrument panel and the top of the instrument cluster (IC) and use a slight outward movement until the top of the instrument cluster (IC) is released. The instrument cluster (IC) can now be rotated outwards.**

6. Remove the 2 screws and the instrument cluster (IC).
   - Disconnect the electrical connector.

INSTALLATION

MKZ

1. Position the instrument cluster (IC) in the instrument panel.
   - Connect the electrical connector.
   - Install the 2 screws.
2. Position the instrument cluster (IC) finish panel and install the 2 screws.

Fusion, Milan

NOTE: **Position the bottom portion of the instrument cluster (IC) on the instrument panel locator pins first then rotate the top of the instrument cluster (IC) into position.**

3. Position the instrument cluster (IC) in the instrument panel.
   - Connect the electrical connector.
   - Install the 2 screws.
4. Install the instrument cluster (IC) finish panel.

All vehicles

5. If a new instrument cluster (IC) was installed, download the instrument cluster (IC) configuration information from the scan tool into the new instrument cluster (IC). For additional information, refer to **MODULE CONFIGURATION** article, PMI.

NOTE: If a new instrument cluster (IC) is installed, updated, or re-configured, the instrument cluster and the powertrain control module (PCM) require a parameter reset to allow the instrument cluster (IC) and the PCM to recognize each other. Failure to carry out the parameter reset to the instrument cluster (IC) and the PCM may result in a no start condition.

6. If a new instrument cluster (IC) was installed, updated or reconfigured, carry out the parameter reset procedure. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

NOTE: The vehicles integrated keys (or standard passive anti-theft system [PATS] keys) must be programmed to the new instrument cluster.

7. If a new instrument cluster (IC) was installed, program the integrated keys. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

INSTRUMENT CLUSTER (IC) LENS

REMOVAL AND INSTALLATION

1. Remove the instrument cluster (IC). For additional information, refer to **Instrument Cluster (IC)**.
2. Remove the screw.

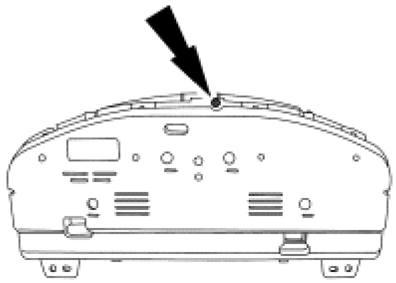

Fig. 56: Locating Instrument Cluster Lens Screw
Courtesy of FORD MOTOR CO.

3. Release the 8 tabs and remove the lens.

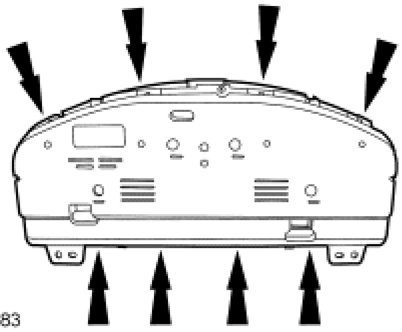

Fig. 57: Locating Instrument Cluster Lens Tabs
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

MESSAGE CENTER SWITCH

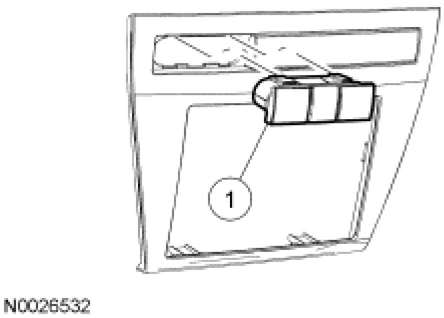

Fig. 58: Exploded View Of Message Center Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	10D889	Message center switch

REMOVAL AND INSTALLATION

1. Remove the instrument panel center finish panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Press the retaining tabs and remove the message center switch.

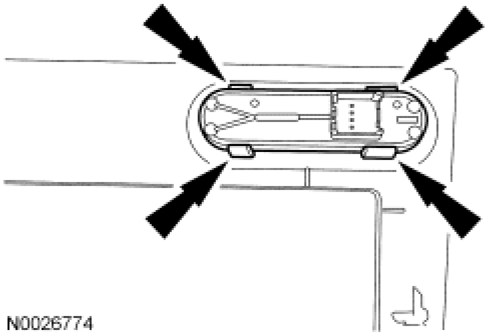

Fig. 59: Locating Message Center Switch Retaining Tabs
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

1. For additional information, refer to the procedures.

INSTRUMENT PANEL

REMOVAL AND INSTALLATION

1. Turn the steering wheel to the straight-ahead position and turn the ignition switch to the OFF position.
   - Remove the key.
2. Depower the supplemental restraint system (SRS). For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

3. Remove the floor console. For additional information, refer to **Console - Floor**.
4. Remove the selector lever or the gearshift lever. For additional information, refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article or **MANUAL TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
5. Remove the LH and RH instrument panel side finish panels.
6. Remove the RH and LH weatherstrips from the front door openings near the instrument panel.
7. Remove the RH and LH A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
8. Remove the RH and LH lower cowl panels.
9. If equipped, remove the RH lower instrument panel insulator.
10. Disconnect the 2 electrical connectors located at the LH lower cowl.

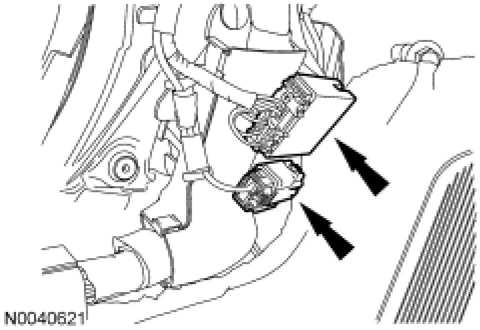

Fig. 6: Locating Electrical Connectors
Courtesy of FORD MOTOR CO.

11. Remove the small gray connector and the large black connector from the Smart Junction Box (SJB).

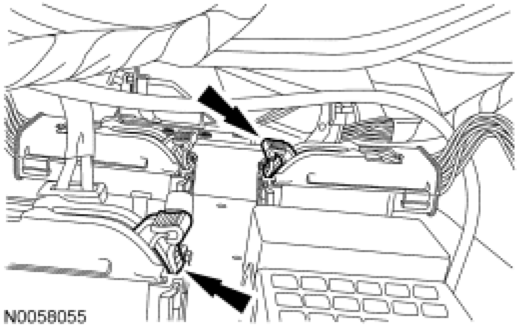

Fig. 7: Locating Black Connector
Courtesy of FORD MOTOR CO.

12. Remove the 2 screws and position the hood release handle aside.

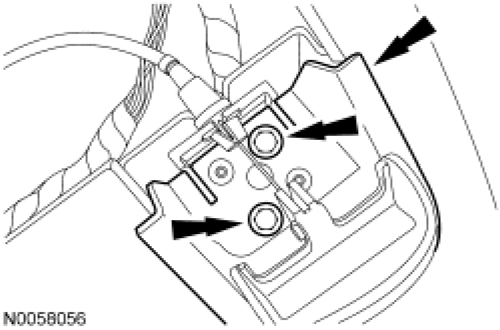

Fig. 8: Locating Hood Latch Release Handle
Courtesy of FORD MOTOR CO.

13. Disconnect the bulkhead electrical connector and the antenna cable located at the RH lower cowl.

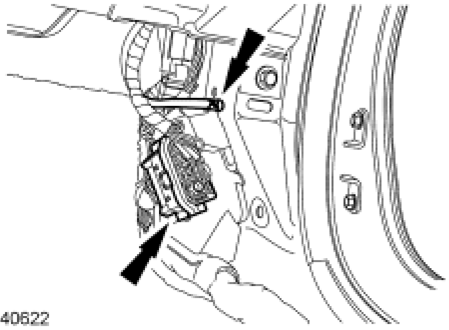

Fig. 9: Locating Bulkhead Electrical Connector And Antenna Lead-In Cable
Courtesy of FORD MOTOR CO.

14. Fully lower the glove compartment door and disconnect the 2 A/C electrical connectors.

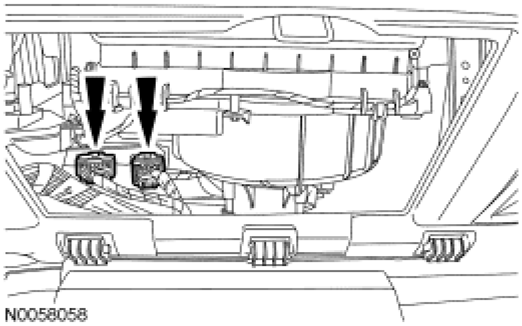

Fig. 10: Locating A/C Electrical Connectors
Courtesy of FORD MOTOR CO.

15. Disconnect the 2 electrical connectors and retainers located on the floor between the 2 front seats.

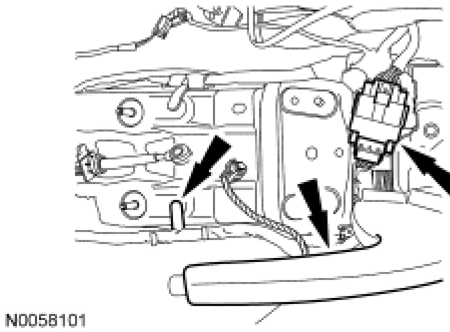

Fig. 11: Locating Electrical Connector
Courtesy of FORD MOTOR CO.

16. Remove the 2 nuts and position the steering column pinch bolt cover aside.

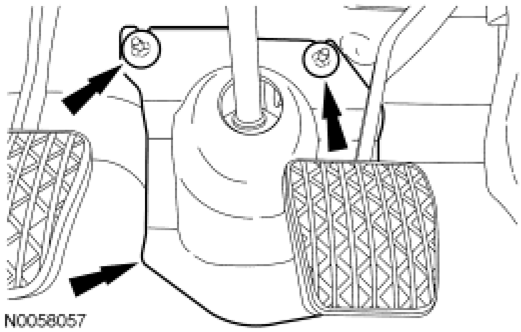

Fig. 12: Locating Steering Column Pinch Bolt Cover
Courtesy of FORD MOTOR CO.

17. Remove and discard the steering column shaft-to-steering column bolt.
    - To install, use a new steering column shaft-to-steering column bolt and tighten to 25 Nm (18 lb-ft).

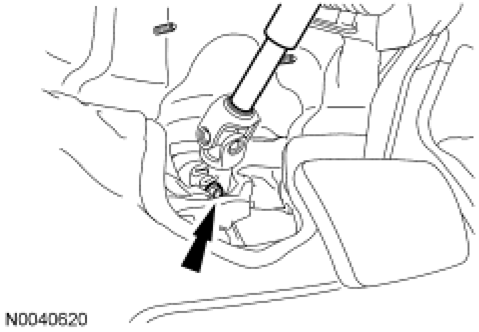

Fig. 13: Locating Steering Column Pinch Bolt
Courtesy of FORD MOTOR CO.

NOTE: **Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring may result. If there is evidence that the shaft has rotated, the clockspring must be removed and**

recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE: Index-mark the steering column shaft position to the steering gear for reference during installation.

18. Detach the upper steering column shaft from the steering column.
19. Remove the instrument cluster finish panel.
20. Remove the instrument cluster.
    - Remove the 2 screws.
    - Remove the instrument cluster.
        - Disconnect the electrical connector.

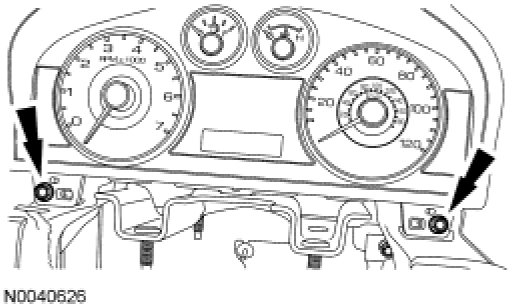

Fig. 14: Locating Instrument Cluster Screws
Courtesy of FORD MOTOR CO.

21. Through the instrument cluster opening, remove the 2 instrument cluster opening bolts.
    - To install, tighten to 18 Nm (159 lb-in).
22. Remove the 2 instrument panel lower bolts.
    - To install, tighten to 8 Nm (71 lb-in).

NOTE: To avoid damaging the instrument panel, the aid of an assistant is required to carry out this step.

23. Remove the instrument panel.
    - Remove the 3 instrument panel side bolts.
    - To install, tighten to 18 Nm (159 lb-in).
24. To install, reverse the removal procedure.

INSTRUMENT PANEL UPPER SECTION

REMOVAL AND INSTALLATION

NOTE: Fusion shown, Milan and MKZ similar.

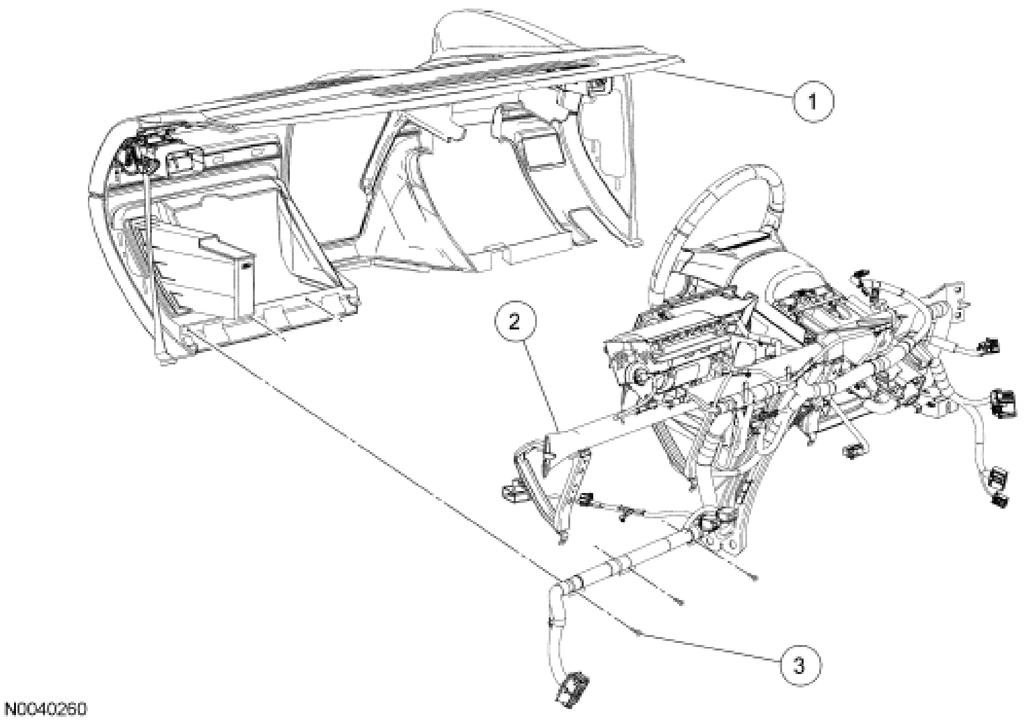

Fig. 15: Exploded View Of Instrument Panel Upper Section - All vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04320	Instrument panel upper section
2	04545	In-vehicle cross beam
3	W707607	Wire harness screw (13 required)

1. Remove the center instrument panel finish panel. For additional information, refer to **Instrument Panel Finish Panel - Center**.

   NOTE: To avoid damaging the in-vehicle cross beam or the instrument panel upper section, spread a suitable covering over the bench on which to place the instrument panel.

   NOTE: Place the instrument panel on the bench and support it upright so that the screws are accessible from the rear.

2. Remove the instrument panel. For additional information, refer to **Instrument Panel**.
3. Remove the steering wheel. For additional information, refer to **STEERING COLUMN** article.
4. Remove the passenger air bag. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

5. Remove the audio unit. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
6. Disconnect the Data Link Connector (DLC) from the lower LH instrument panel.
7. Remove the headlamp switch. For additional information, refer to **EXTERIOR LIGHTING** article.

NOTE: **To avoid damaging the instrument panel upper section, the aid of an assistant is required to carry out this step.**

NOTE: **Do not twist or bend the instrument panel upper section when removing it from the vehicle.**

8. Remove the instrument panel upper section.
   - Remove the 13 wire harness screws and remove the instrument panel upper section.
9. To install, reverse the removal procedure.

INSTRUMENT PANEL FINISH PANEL - CENTER

REMOVAL AND INSTALLATION

Fusion, Milan

1. Using a suitable tool, gently pry out the upper center instrument panel finish panel to disengage the clips.
2. Remove the upper center instrument panel finish panel.
   - Disconnect the electrical connectors.
3. Using a suitable tool, gently pry out the lower center instrument panel finish panel to disengage the clips.
4. Remove the lower center instrument panel finish panel.
   - Disconnect the electrical connectors.

MKZ

5. Remove the floor console finish panel.
6. Remove the lower center instrument panel finish panel screw beneath the ash tray and the lower center instrument panel finish panel.
   - Disconnect the electrical connectors.
7. Remove the 2 upper center instrument panel finish panel lower screws.

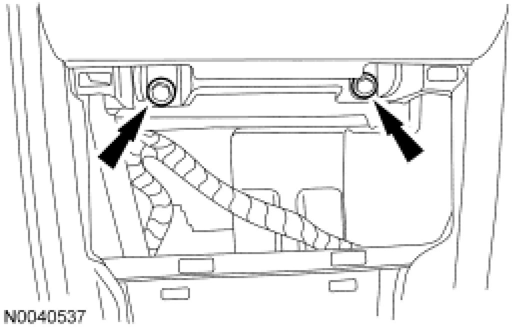

Fig. 16: Locating Upper Center Instrument Panel Finish Panel Lower Screws
Courtesy of FORD MOTOR CO.

8. Remove both center instrument panel registers. For additional information, refer to **CLIMATE CONTROL** article.
9. Working through the center instrument panel register openings, remove the 2 upper center instrument panel finish panel upper screws.
10. Remove the upper center instrument panel finish panel.
    - Disconnect the electrical connectors.

All vehicles

11. To install, reverse removal procedure.

STORAGE COMPARTMENT - UPPER

REMOVAL AND INSTALLATION

1. Remove the instrument panel finish panel.
2. Remove the 2 upper storage compartment screws and remove the upper storage compartment.
3. To install, reverse the removal procedure.

CONSOLE - FLOOR

NOTE: Fusion, Milan shown, MKZ similar.

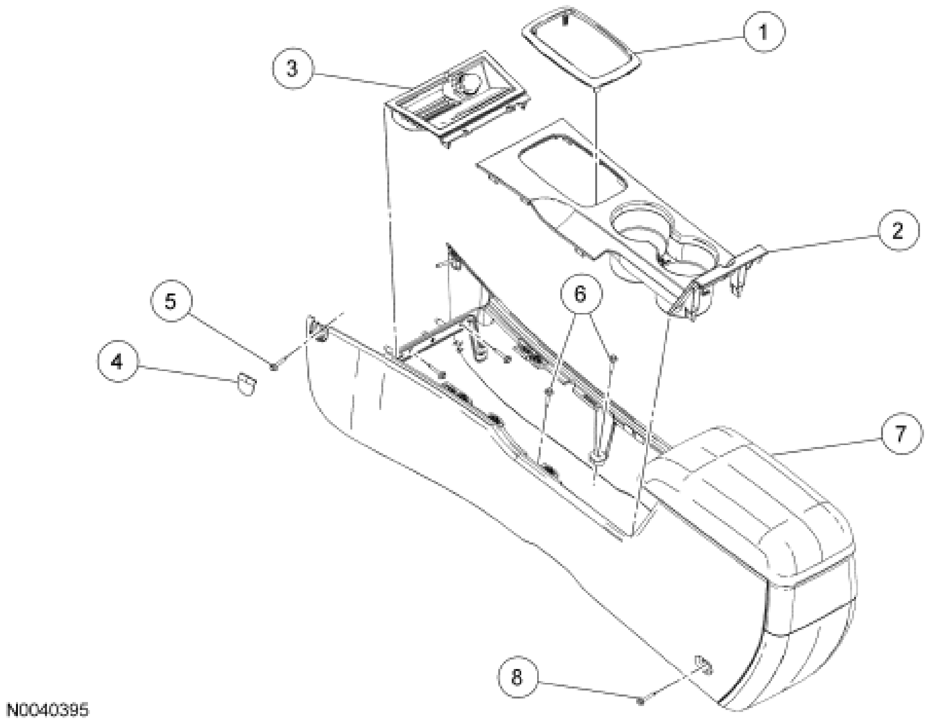

Fig. 17: Exploded View Of Floor Console
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	061A16	Selector lever trim ring
2	045A76	Floor console finish panel
3	-	Floor console utility tray
4	672A40	Floor console bolt cover (2 required)
5	W711401	Floor console bolt (2 required)
6	W709955	Floor console center bolts (2 required)
7	045A36	Floor console
8	W711401	Floor console rear bolt (2 required)

REMOVAL AND INSTALLATION

All vehicles

1. Position the front seats forward and remove the 2 floor console rear bolts.
2. Position the front seats rearward.
3. If equipped, pull the parking brake handle upward.

Fusion, Milan

4. If equipped with an automatic transmission, remove the selector lever trim ring.

All vehicles

5. If equipped with a manual transmission, remove the gearshift knob.
6. Open the storage compartment door.
7. Remove the floor console finish panel.
    - Disconnect the electrical connectors.

Fusion, Milan

8. Remove the utility tray.
    - Disconnect the electrical connector.
    - Disconnect the audio jack connector.
9. Remove the 2 floor console bolt covers.
10. Remove the 2 floor console bolts.

MKZ only

11. Remove the LH and RH floor console trim panels.

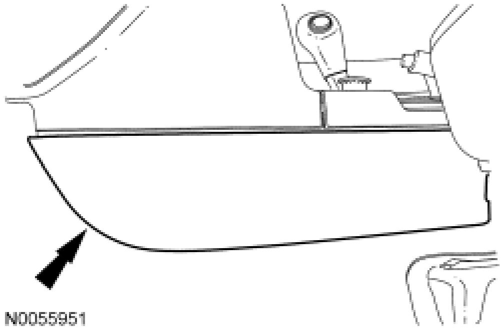

Fig. 18: Identifying Console Side Finish Panels
Courtesy of FORD MOTOR CO.

12. Remove the 2 floor console-to-instrument panel bolts (one each side).

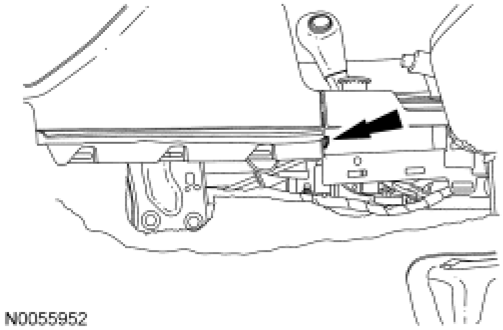

Fig. 19: Identifying Console-To-Instrument Panel Bolts
Courtesy of FORD MOTOR CO.

All vehicles

13. Remove the 4 floor console bolts and remove the floor console.
14. To install, reverse the removal procedure.

CONSOLE - OVERHEAD

REMOVAL AND INSTALLATION

NOTE: Fusion shown, Milan and MKZ similar.

1. Open the overhead console compartment door.

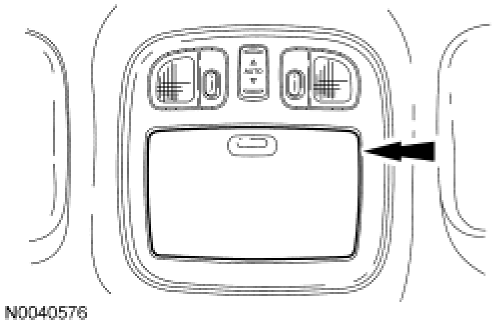

Fig. 20: Locating Overhead Console Compartment Door
Courtesy of FORD MOTOR CO.

2. From inside the compartment, remove the 2 screws.
3. Remove the overhead console.
   - Disconnect the electrical connectors.
4. To install, reverse the removal procedure.

POWER POINT

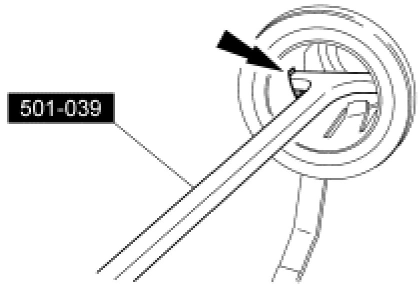
Special Tools

Illustration	Tool Name	Tool Number
	Remover, Power Point Socket	501-039 or equivalent

REMOVAL

NOTE: Power point cover may differ depending on location.

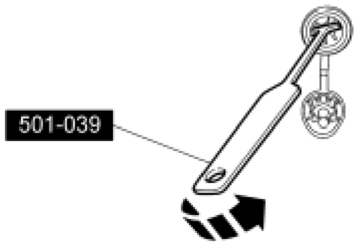
1. Open the power point cover.
2. Install the Power Point Socket Remover in one of the power point socket slots.



N0061767

Fig. 21: Installing Special Tool (501-039) In Power Point Socket Slot
Courtesy of FORD MOTOR CO.

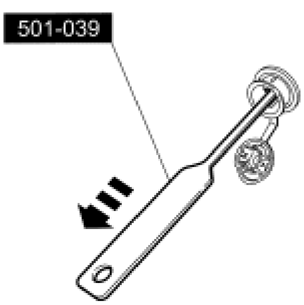
3. Position the Power Point Socket Remover so that it engages in the adjacent slot.



N0061768

Fig. 22: Positioning Special Tool (501-039) To Engage In Adjacent Slot
Courtesy of FORD MOTOR CO.

4. Using the Power Point Socket Remover, pull the power point socket out of the retainer.



N0061769

Fig. 23: Pulling Power Point Socket Out Of Retainer
Courtesy of FORD MOTOR CO.

5. Disconnect the electrical connector.

INSTALLATION

1. Connect the electrical connector.
2. Slide the power point socket into the retainer.

2008 ENGINE PERFORMANCE

Intake Air Distribution & Filtering - 3.5L - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Air cleaner assembly bolts	5	-	44
Air cleaner outlet pipe-to-air cleaner cover clamp	5	-	44
Air cleaner outlet pipe-to-throttle body clamp	5	-	44
Intake air resonator nuts	15	11	-

DESCRIPTION AND OPERATION

INTAKE AIR DISTRIBUTION AND FILTERING

The air intake system consists of the:

- air cleaner inlet.
- air cleaner element.
- mass air flow (MAF) sensor.
- air cleaner outlet and resonator assembly.

The air intake system:

- cleans intake air with a replaceable, dry-type air cleaner element.
- measures airflow and air temperature with the MAF sensor.

DIAGNOSTIC TESTS

INTAKE AIR DISTRIBUTION AND FILTERING

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

INTAKE AIR SYSTEM COMPONENTS - EXPLODED VIEW

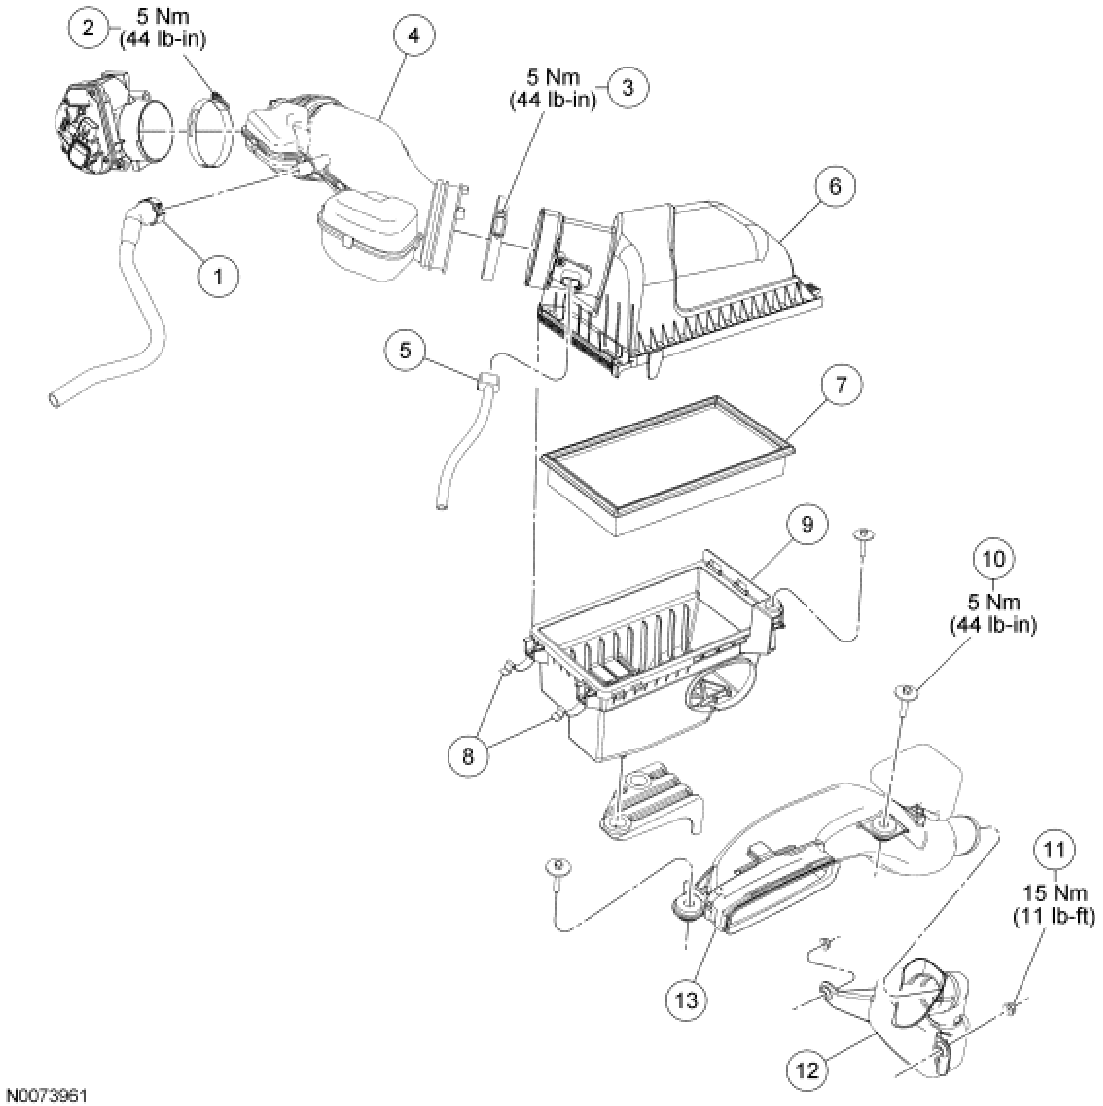


Fig. 1: Exploded View Of Intake Air System Components With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	6758	Crankcase vent tube
2	9C632	Air cleaner outlet pipe-to-throttle body clamp
3	9C632	Air cleaner outlet pipe-to-air cleaner cover clamp
4	9B659	Air cleaner outlet pipe
5	14A464	Mass air flow (MAF) sensor electrical connector
6	-	Air cleaner housing cover (part or 9600)
7	9601	Air cleaner element

8	9628	Air cleaner housing-to-air cleaner cover clamps
9	9600	Air cleaner housing
10	W710317	Air cleaner bolt (3 required)
11	W520413	Intake air resonator nut (2 required)
12	9F763	Intake air resonator
13	9A675	Intake air pipe

1. For additional information, refer to the procedures.

AIR CLEANER

REMOVAL AND INSTALLATION

1. Disconnect the mass air flow (MAF) sensor electrical connector and wiring harness retainer.
2. Loosen the clamp and disconnect the air cleaner outlet pipe from the air cleaner.
   - To install, tighten to 5 Nm (44 lb-in).
3. Remove the 3 bolts from the air cleaner assembly.
   - To install, tighten to 5 Nm (44 lb-in).
4. Separate the 2 air cleaner feet from the rubber grommets and the air cleaner inlet pipe and remove the air cleaner assembly.

NOTE: **Make sure that the 2 air cleaner feet are seated into the rubber grommets under the air cleaner assembly.**

NOTE: **The air cleaner outlet pipe should be securely sealed to prevent unmetered air from entering the engine.**

5. To install, reverse the removal procedure.

AIR CLEANER OUTLET PIPE

REMOVAL AND INSTALLATION

1. Disconnect the crankcase vent tube from the air cleaner outlet pipe.
2. Loosen the air cleaner outlet pipe-to-air cleaner cover clamp.
   - To install, tighten to 5 Nm (44 lb-in).
3. Loosen the air cleaner outlet pipe-to-throttle body clamp.
   - Remove the air cleaner outlet pipe.
   - To install, tighten to 5 Nm (44 lb-in).

NOTE: **The air cleaner outlet pipe should be securely sealed to prevent unmetered air from entering the engine.**

4. To install, reverse the removal procedure.

INTAKE AIR RESONATOR

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the LH fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
3. Remove the 2 nuts and the air intake resonator.
    - To install, tighten to 15 Nm (11 lb-ft).

NOTE: **Make sure that the air cleaner inlet pipe is securely seated to the intake air resonator.**

4. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Interior Lighting - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

INTERIOR LIGHTING

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The interior lighting system consists of the following components:

- SJB
- Instrument panel dimmer switch
- Interior/map lamps
- Luggage compartment lamp
- Vanity mirror lamps
- Puddle lamps (if equipped)
- Door ajar switches
- Luggage compartment lid ajar switch
- Ambient lighting module (if equipped)
- Ambient lighting switch (if equipped)

The interior lighting system consists of up to 3 subsystems:

- Courtesy lamps
- Demand lamps
- Ambient lighting (if equipped)

The courtesy lamp subsystem consists of the interior dome lamps, luggage compartment lamp, and the puddle lamps (if equipped). The courtesy lamps illuminate as a system when requested by the SJB during such conditions as an open vehicle door.

The demand lamps subsystem consists of the front map lamps and the left and right vanity mirror lamps. The demand lamps illuminate individually when the vehicle occupant activates them.

Both the courtesy and the demand lamps are controlled by the SJB. The SJB sets DTCs if certain circuit failures exist with the interior lighting system.

The ambient lighting feature allows the vehicle occupant to lightly illuminate the interior of the vehicle in a variety of colors. The ambient lighting system consists of the following:

- Ambient lighting switch (located in the center console)

- Ambient lighting module (located in the center console)
- LEDs (hardwired in the ambient lighting electrical harness)
  - Located on the center console cupholder, the storage bin, and the front and rear footwells

The ambient lighting system is powered through the accessory delay relay.

DIAGNOSTIC TESTS

INTERIOR LIGHTING

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communications Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1438-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB supplies voltage to the interior lighting system. The interior lighting system illuminates the courtesy lamps to enhance visibility of the interior while a vehicle door is open or ajar, and the vehicle speed is less than 15 km/h (9 mph). The SJB controls all interior lighting functions and timing by monitoring inputs from the door ajar switches and vehicle speed.

Interior Lighting Delay

The interior lighting delay feature provides temporary illumination of the courtesy lamps after the doors are opened and then closed. The interior lighting delay feature will keep the courtesy lamps on for a period of 25 seconds. If during the 25 second delay time the SJB detects that the ignition has been turned ON, or if the vehicle is locked using the remote keyless entry (RKE) transmitter or the keyless entry keypad, the courtesy

lamp illumination will be discontinued.

Illuminated Entry

The illuminated entry feature illuminates the courtesy lamps when the ignition is off and either the RKE transmitter UNLOCK button is pressed, or the vehicle is unlocked using the keyless entry keypad. The illuminated entry feature turns the courtesy lamps off when 25 seconds have elapsed, the ignition is switched to ON, the RKE transmitter LOCK button is pressed, or the vehicle is locked using the keyless entry keypad.

Illuminated Exit

The illuminated exit feature illuminates the courtesy lamps for 25 seconds when all doors are closed and the ignition key is removed from the ignition lock cylinder. The illuminated exit feature turns the courtesy lamps off when the ignition key is inserted into the ignition lock cylinder or 25 seconds have elapsed.

Theater Lighting (MKZ Only)

The theater lighting feature ramps-up the courtesy lamps intensity over 0.7 seconds when courtesy lamp activation is requested. The theater lighting feature ramps-down the courtesy lamps intensity over 1.7 seconds when interior lighting deactivation is requested by any feature other than the panic alarm or battery saver.

Interior Lamp Arbitrator

The interior lamp arbitrator (a function of the SJB) chooses between the interior lighting, interior mode, interior lighting delay, illuminated entry, illuminated exit and battery saver to determine which feature has precedence of activating and deactivating the interior lamps. The features are prioritized as follows: battery saver, interior mode, interior lighting, interior light delay, illuminated entry, and illuminated exit.

Ambient Lighting

The ambient lighting feature provides illumination to the center console cupholder, the storage bin, and the front and rear footwells. There are a total of 7 LED locations. The ambient lighting feature is powered by the accessory delay relay, which allows the ambient lighting feature to be used independent of the parking lamps status.

The ambient lighting module provides voltage and ground to the LEDs. There are 3 different color LEDs (red, blue, and green) housed within each LED assembly. By illuminating various color combinations, the LEDs are able to produce 7 different colors of ambient light. The ambient lighting switch is an input to the ambient lighting module. With each press of the switch, the ambient lighting module cycles through a different color variation or turns the ambient lighting feature off. The module retains the last color setting between uses.

Battery Saver

The battery saver is internal to the SJB and provides automatic shutoff of the demand lamps (vanity lamps, map lamps and glove compartment lamp) and courtesy lamps after a period of 30 minutes (10 minutes if the lights are on due to a door ajar) has elapsed in order to save battery voltage. A timer in the SJB starts when the ignition is turned to the OFF position. When the time-out period for the lamps has elapsed, the voltage is automatically shutoff to the lamps by the battery saver.

To activate the battery saver feature, one of the following events must occur:

- The ignition is transition out of the OFF position
- Any door is opened
- The luggage compartment lid is opened
- The UNLOCK button of the RKE transmitter is pressed
- The keyless entry keypad is used to unlock the vehicle

Field-Effect Transistor (FET) Protection (MKZ Only)

The SJB utilizes a protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. The circuit then resets after an ignition cycle or customer demand of the function (switching the component on, battery saver being energized). When an excessive circuit load occurs several times, a continuous DTC is stored and the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC clears and the circuit function returns.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Courtesy lamps • Map lamps • Luggage compartment lamp • Vanity lamps • Glove compartment lamp • Ambient lighting switch (if equipped)	• Smart junction box (SJB) fuse 3 (15A) • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool release software.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
    - Check the VCM connection to the vehicle.
    - Check the scan tool connection to the VCM.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - Verify the ignition key is in the ON position.
    - Verify the scan tool operation with a known good vehicle.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
    - If the scan tool responds with no communication with the SJB, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The courtesy lamps are inoperative	• Fuse • Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test A**.
• An individual courtesy lamp is inoperative	• Wiring, terminals or connectors • Interior lamp	• Go to **Pinpoint Test B**.
• The courtesy lamps stay on continuously	• Wiring, terminals or connectors • Door ajar switch • Luggage compartment lid ajar switch • Instrument panel dimmer switch • SJB	• Go to **Pinpoint Test C**.
• The courtesy lamps do not turn on with one door open	• Wiring, terminals or connectors • Door ajar switch • SJB	• Go to **Pinpoint Test D**.
• The courtesy lamps do not turn on with the luggage compartment lid open	• Wiring, terminals or connectors • Luggage compartment lid ajar switch • SJB	• Go to **Pinpoint Test D**.
• The demand lamps are inoperative	• Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test E**.
• An individual demand lamp is inoperative	• Wiring, terminals or connectors • Interior lamp	• Go to **Pinpoint Test F**.
• The illuminated entry is inoperative when using the remote keyless entry (RKE) transmitter	• RKE system concern • SJB	• Go to **Pinpoint Test G**.

• The battery saver does not deactivate after time-out	• Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test H**.
• The puddle lamps are inoperative	• Wiring, terminals or connectors • Exterior mirror	• Go to **Pinpoint Test I**.
• The courtesy lamps are inoperative from the instrument panel dimmer switch	• Dimmable back lighting illumination system concern • Wiring, terminals or connectors • Instrument panel dimmer switch • SJB	• Go to **Pinpoint Test J**.
• The ambient lighting is inoperative	• Wiring, terminals or connectors • Ambient lighting switch • Ambient lighting module	• Go to **Pinpoint Test K**.
• An individual ambient lighting LED is inoperative/does not operate correctly	• Ambient lighting harness	**NOTE:** **The LEDs are not serviceable separate from the harness.** • INSTALL a new ambient lighting harness. TEST the system for normal operation.
• The ambient lighting does not cycle through all color combinations	• Wiring, terminals or connectors • Ambient lighting switch • Ambient lighting module	• Go to **Pinpoint Test L**.

Pinpoint Tests

Pinpoint Test A: The Courtesy Lamps Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

Power is supplied to the courtesy lamps through the smart junction box (SJB) fuse 3 (15A), which supplies voltage to the courtesy lamps relay, the demand lamps relay (Fusion, Milan only), and the demand lamps field-effect transistor (FET) (MKZ only). When any door is opened, the ajar switch opens, signaling the SJB to activate the courtesy lamps. The SJB monitors the ajar circuits, and based on the ajar status, the SJB will supply voltage to the courtesy lamps on circuit CLN26 (BU). Ground for the courtesy lamps is supplied through circuit GD139 (BK/YE) or GD126 (BK/WH).

- DTC B2499 (Courtesy Lamp Output Failure) - sets when the FET output has been disabled due to an over-current fault on circuit CLN26 (BU). This continuous DTC applies to MKZ only, and it can only be cleared once the fault has been repaired and the on-demand self-test is re-run.

This pinpoint test is intended to diagnose the following:

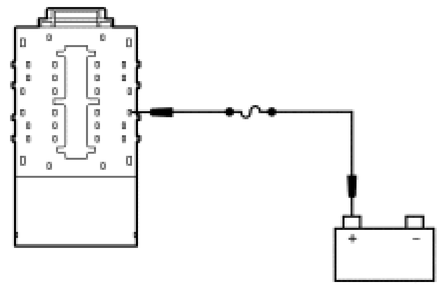
- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST A: THE COURTESY LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK CIRCUIT CLN26 (BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280e



N0038704

Fig. 1: Checking Circuit CLN26 (BU) For Open
Courtesy of FORD MOTOR CO.

NOTE: If the fuse fails, repair circuit CLN26 (BU) for a short to ground. For MKZ, clear the DTCs and repeat the self-test after the repair.

- Connect a fused jumper wire between the SJB C2280e-16, circuit CLN26 (BU), harness side and battery positive.
- **Do the courtesy lamps illuminate?**

YES : REMOVE the jumper wire. VERIFY the SJB fuse 3 (15A) is OK. If OK, go to A3. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

NO : REMOVE the jumper wire. Go to A2.

A2 CHECK CIRCUIT CLN09 (YE/GN) FOR A SHORT TO GROUND

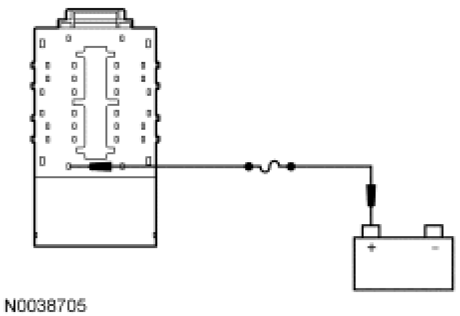


Fig. 2: Checking Circuit CLN09 (YE/GN) For A Short To Ground
Courtesy of FORD MOTOR CO.

NOTE: If the fuse fails, repair circuit CLN09 (YE/GN) for a short to ground.

- Connect a fused jumper wire between the SJB C2280e-2, circuit CLN09 (YE/GN), harness side and battery positive.
- Operate the demand lighting on one of the interior lamps.
- **Does the demand lighting operate correctly?**

  YES : REMOVE the jumper wire. VERIFY the SJB fuse 3 (15A) is OK. If OK, go to A3. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

  NO : REMOVE the jumper wire. Go to A4.

A3 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.
- Disconnect: Front Interior Lamp C930

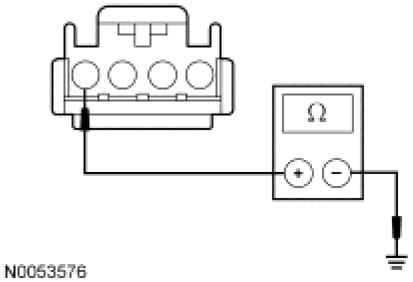

Fig. 3: Checking Circuit GD139 (BK/YE) For An Open - Vehicles With An Overhead Console
Courtesy of FORD MOTOR CO.

- Measure the resistance between the front interior lamp C930-1, circuit GD139 (BK/YE), harness

side and ground.

- **Is the resistance less than 5 ohms?**

  YES : REPAIR circuit CLN26 (BU) for an open. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

A4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: An Individual Courtesy Lamp Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Luggage Compartment Lid Release for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides voltage to the courtesy lamps on circuit CLN26 (BU). The courtesy lamps are grounded through circuit GD139 (BK/YE). The luggage compartment lamp is also on the courtesy lamp circuit. Circuit CLN26 (BU) provides voltage to the luggage compartment lamp, and the lamp is grounded through circuit GD139 (BK/YE).

For a concern with the puddle lamps, go to **Pinpoint Test I**.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior lamp

PINPOINT TEST B: AN INDIVIDUAL COURTESY LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK THE COURTESY LAMP

- Key in OFF position.
- Disconnect: Suspect Interior Lamp
- Operate the courtesy lamps by opening the LF door.
- Measure the voltage between the suspect courtesy lamp, harness side as follows:

Location	Connector-Pin/ Circuit	Connector-Pin/ Circuit
Front interior lamp	C930-3 CLN26 (BU)	C930-1 GD139 (BK/YE)
Rear interior lamp	C901-1 CLN26 (BU)	C901-2 GD139 (BK/YE)
Luggage compartment lamp	C4198-1 CLN26 (BU)	C4198-2 GD139 (BK/YE)

- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new interior lamp for the suspect lamp. REFER to **Interior Lamp - Front** or **Interior Lamp - Rear**. TEST the system for normal operation.

  NO : Go to B2.

B2 CHECK CIRCUIT CLN26 (BU) FOR VOLTAGE

- Measure the voltage between the suspect courtesy lamp, harness side and ground as follows:

Location	Connector-Pin	Circuit
Front interior lamp	C930-3	CLN26 (BU)
Rear interior lamp	C901-1	CLN26 (BU)
Luggage compartment lamp	C4198-1	CLN26 (BU)

- **Is the voltage greater than 10 volts?**

  YES : REPAIR circuit GD139 (BK/YE) for the lamp in question. TEST the system for normal operation.

  NO : REPAIR circuit CLN26 (BU) for the lamp in question. TEST the system for normal

operation.

Pinpoint Test C: The Courtesy Lamps Stay On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Luggage Compartment Lid Release for schematic and connector information.

Normal Operation

When any door or the luggage compartment lid is open, the ajar switch opens the monitored circuit to the smart junction box (SJB). The SJB monitors the ajar switches and the instrument panel dimmer switch, and based on the input, the SJB supplies voltage to the courtesy lamps on circuit CLN26 (BU).

DTC Description	Fault Trigger Conditions
B1320 - Driver Door Ajar Circuit Open	Sets during the on-demand self-test if an open is detected in the LF door ajar circuit.
B1328 - Passenger Door Ajar Circuit Open	Sets during the on-demand self-test if an open is detected in the RF door ajar circuit.
B1331 - Decklid Ajar Rear Door Circuit Failure	Sets during the on-demand self-test if an open is detected in the luggage compartment lid circuit.
B1336 - Door Ajar RR Circuit Open	Sets during the on-demand self-test if an open is detected in the RR door ajar circuit.
B1572 - Door Ajar LR Circuit Open	Sets during the on-demand self-test if an open is detected in the LR door ajar circuit.
B1688 - Lamp Dome Input Circuit Short to Ground	Sets during the on-demand self-test if circuit CLN28 (GN/BU) has continuity to ground during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door ajar switch
- Luggage compartment lid ajar switch
- Instrument panel dimmer switch
- SJB

PINPOINT TEST C: THE COURTESY LAMPS STAY ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE SJB DTCs

NOTE: Make sure all doors (including the luggage compartment lid) are closed and that the instrument panel dimmer switch is not in the DOME LAMPS position before running the SJB on-demand self-test, or the results may not be accurate.

- Carry out the SJB on-demand self-test.
- **Are any DTCs recorded?**

  YES : For DTC B1320, B1328, B1331, B1336 or B1572, go to C2.

  For DTC B1688, go to C6.

  For all other DTCs, REFER to **DTC Charts**.

  NO : Go to C8.

C2 CHECK THE AJAR SWITCH GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: Suspect Ajar Switch
- Measure the resistance between the suspect ajar switch, harness side and ground as follows:

Location	Connector-Pin	Circuit
LH front	C525-6	GD126 (BK/WH)
RH front	C603-6	GD139 (BK/YE)
LH rear	C704-6	GD126 (BK/WH)
RH rear	C804-6	GD139 (BK/YE)
Luggage compartment	C429-1	GD171 (BK/GY)

- **Is the resistance less than 5 ohms?**

  YES : Go to C3.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C3 CHECK THE AJAR SWITCH FOR VOLTAGE

- Measure the voltage between the suspect ajar switch, harness side and ground as follows:

Location	Suspect Ajar Switch Connector-Pin	Circuit
LH front	C525-8	CPL26 (GN/VT)
RH front	C603-8	CPL31 (WH)
LH rear	C704-8	CPL36 (GN)
RH rear	C804-8	CPL39 (YE)
Luggage compartment	C429-1	CPL44 (YE/OG)

- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new latch for the ajar switch in question. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C4.

C4 CHECK THE AJAR SWITCH CIRCUIT FOR AN OPEN

- Disconnect: SJB C2280c
- Measure the resistance between the suspect ajar switch, harness side and the SJB, harness side as follows:

Location	SJB Connector-Pin	Suspect Ajar Switch Connector-Pin	Circuit
LH front	C2280c-11	C525-8	CPL26 (GN/VT)
RH front	C2280c-12	C603-8	CPL31 (WH)
LH rear	C2280c-8	C704-8	CPL36 (GN)
RH rear	C2280c-7	C804-8	CPL39 (YE)
Luggage compartment	C2280c-6	C429-1	CPL44 (YE/OG)

- **Is the resistance less than 5 ohms?**

  YES : Go to C5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK THE AJAR SWITCH OPERATION

- Connect: Suspect Ajar Switch
- Measure the resistance between the SJB, harness side and ground, while opening and closing the suspect door (or the luggage compartment) as follows:

Location	SJB Connector-Pin	Circuit
LH front	C2280c-11	CPL26 (GN/VT)
RH front	C2280c-12	CPL31 (WH)
LH rear	C2280c-8	CPL36 (GN)
RH rear	C2280c-7	CPL39 (YE)
Luggage compartment	C2280c-6	CPL44 (YE/OG)

- **Is the resistance less than 5 ohms when the suspect door (or the luggage compartment) is closed, and greater than 10,000 ohms when the suspect door (or the luggage compartment) is open?**

  YES : Go to C9.

  NO : INSTALL a new latch for the switch in question. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. CLEAR the DTCs. REPEAT the self-test.

C6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH

- Key in OFF position.
- Disconnect: Instrument Panel Dimmer Switch C2065
- Observe the courtesy lamps.
- **Are the courtesy lamps still illuminated?**

  YES : Go to C7.

  NO : INSTALL a new instrument panel dimmer switch. REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK CIRCUIT CLN28 (GN/BU) FOR A SHORT TO GROUND

- Disconnect: SJB C2280d
- Observe the courtesy lamps.
- **Are the courtesy lamps still illuminated?**

  YES : Go to C9.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C8 CHECK CIRCUIT CLN26 (BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.

- Disconnect: SJB C2280e
- Observe the courtesy lamps.
- **Are the courtesy lamps still illuminated?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to C9.

C9 CHECK FOR CORRECT SJB OPERATION

- Connect: Luggage Compartment Lid Ajar Switch C429 (if disconnected)
- Connect: Suspect Door Ajar Switch (if disconnected)
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Courtesy Lamps Do Not Turn On With One Door Open

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Door Locks for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Luggage Compartment Lid Release for schematic and connector information.

Normal Operation

When any door is open, including the luggage compartment lid, the ajar switch opens the circuit to the smart junction box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB will supply voltage to the courtesy lamps on circuit CLN26 (BU).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door ajar switch
- Luggage compartment lid ajar switch

- SJB

PINPOINT TEST D: THE COURTESY LAMPS DO NOT TURN ON WITH ONE DOOR OPEN

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK THE AJAR SWITCH PIDs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB ajar switch PIDs while opening and closing the suspect door or the luggage compartment lid as follows:

Suspect Ajar Switch	PID
LF door	D_DR_SW
RF door	P_DR_SW
LR door	LRDR_SW
RR door	RRDR_SW
Luggage compartment lid	DECKLID

- **Does the PID value agree with the ajar switch position?**

  YES : Go to D4.

  NO : Go to D2.

D2 CHECK THE DOOR AJAR SWITCH OPERATION

- Key in OFF position.
- Disconnect: Suspect Ajar Switch
- Observe the interior lamps.
- **Do the interior lamps illuminate with the suspect ajar switch disconnected?**

  YES : INSTALL a new door latch or luggage compartment lid latch for the suspect ajar switch. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. TEST the system for normal operation.

  NO : Go to D3.

D3 CHECK THE AJAR SWITCH CIRCUIT FOR A SHORT TO GROUND

- Disconnect: SJB C2280c
- Measure the resistance between the suspect ajar switch, harness side and ground as follows:

Location	Connector-Pin	Circuit

LF door	C525-8	CPL26 (GN/VT)
RF door	C603-8	CPL31 (WH)
LR door	C704-8	CPL36 (GN)
RR door	C804-8	CPL39 (YE)
Luggage compartment lid	C429-1	CPL44 (YE/OG)

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D4.

  NO : REPAIR the circuit. TEST the system for normal operation.

D4 CHECK FOR CORRECT SJB OPERATION

- Connect: Suspect Ajar Switch (If Disconnected)
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Demand Lamps Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies voltage to the demand lamps on circuit CLN09 (YE/GN). The demand lamps are grounded through circuit GD139 (BK/YE). The glove compartment lamp (MKZ only) is case grounded.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST E: THE DEMAND LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK THE OPERATION OF THE COURTESY LAMPS

- Key in ON position.
- Operate the courtesy lamps by opening the LF door.
- **Do the courtesy lamps illuminate?**

  YES : Go to E2.

  NO : Go to **Pinpoint Test A**.

E2 CHECK CIRCUIT CLN09 (YE/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280e

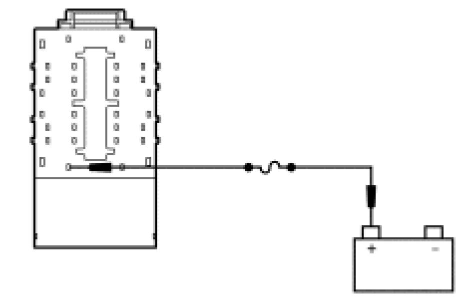

Fig. 4: Checking Circuit CLN09 (YE/GN) For An Open
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between the SJB C2280e-2, circuit CLN09 (YE/GN), harness side and battery positive.
- **Do the demand lamps illuminate?**

  YES : REMOVE the jumper wire. Go to E3.

  NO : REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.

E3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: An Individual Demand Lamp Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies voltage to the demand lamps on circuit CLN09 (YE/GN). The demand lamps are grounded through circuit GD139 (BK/YE). The glove compartment lamp (MKZ only) is case grounded.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior lamp

PINPOINT TEST F: AN INDIVIDUAL DEMAND LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

F1 CHECK CIRCUIT CLN09 (YE/GN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Demand Lamp
- Key in ON position.
- Measure the voltage between the suspect demand lamp, harness side and ground as follows:

Location	Connector-Pin	Circuit
RH vanity mirror lamp	C906-1	CLN09 (YE/GN)
LH vanity mirror lamp	C907-1	CLN09 (YE/GN)
Front interior lamp	C930-2	CLN26 (BU)

Rear interior lamp	C901-3	CLN09 (YE/GN)
Glove compartment lamp	C254-1	CLN09 (YE/GN)

- **Is the voltage greater than 10 volts?**

  YES : Go to F2.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

F2 CHECK THE GROUND CIRCUIT FOR AN OPEN

- Measure the resistance between the suspect demand lamp connector, harness side and ground as follows:

Location	Connector-Pin	Circuit
RH vanity mirror lamp	C906-2	GD139 (BK/YE)
LH vanity mirror lamp	C907-2	GD139 (BK/YE)
Front interior lamp	C930-1	GD139 (BK/YE)
Rear interior lamp	C901-2	GD139 (BK/YE)
Glove compartment lamp	Case ground	-

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new demand lamp for the suspect lamp. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test G: The Illuminated Entry Is Inoperative When Using The Remote Keyless Entry (RKE) Transmitter

Normal Operation

The illuminated entry provides interior lighting whenever the smart junction box (SJB) receives a door unlock request from the RKE transmitter. The SJB provides voltage on circuit CLN26 (BU) for the courtesy lamps.

This pinpoint test is intended to diagnose the following:

- RKE system concern
- SJB

PINPOINT TEST G: THE ILLUMINATED ENTRY IS INOPERATIVE WHEN USING THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

G1 CHECK FOR CORRECT RKE OPERATION

- Using the RKE transmitter, lock and unlock the doors.
- **Do the doors lock and unlock?**

  YES : Go to G2.

  NO : REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article to continue diagnosis of the RKE system.

G2 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test H: The Battery Saver Does Not Deactivate After Time-Out

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides a battery saver function. The battery saver function provides automatic shutoff of the interior lamps (courtesy lamps and demand lamps) after a predetermined time has elapsed in order to save battery power.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST H: THE BATTERY SAVER DOES NOT DEACTIVATE AFTER TIME-OUT

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

H1 CHECK CIRCUIT CLN09 (YE/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280e
- Key in ON position.
- Operate the demand lamps.
- **Do the demand lamps illuminate?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to H2.

H2 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Puddle Lamps Are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides voltage to the puddle lamps through circuit CLN26 (BU) whenever the courtesy lamps are active. The puddle lamps have separate ground circuits. The LH exterior mirror is grounded through circuit GD126 (BK/WH), and the RH exterior mirror is grounded through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Exterior mirror

PINPOINT TEST I: THE PUDDLE LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

I1 CHECK THE COURTESY LAMP OPERATION

- Operate the courtesy lamps by opening the LF door.
- **Do the courtesy lamps illuminate?**

  YES : Go to I2.

  NO : Go to **Pinpoint Test A**.

I2 CHECK CIRCUIT CLN26 (BU) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Exterior Mirror
- Operate the courtesy lamps by opening the LF door.
- Measure the voltage between the suspect exterior mirror, harness side and ground as follows:

Location	Connector-Pin	Circuit
RH exterior mirror (without memory)	C625-4	CLN26 (BU)
RH exterior mirror (with memory)	C626-5	CLN26 (BU)
LH exterior mirror (without memory)	C517-4	CLN26 (BU)
LH exterior mirror (with memory)	C522-5	CLN26 (BU)

- **Is the voltage greater than 10 volts?**

  YES : Go to I3.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

I3 CHECK THE GROUND CIRCUIT FOR AN OPEN

- Measure the resistance between the suspect exterior mirror, harness side and ground as follows:

Location	Connector-Pin	Circuit
RH		

exterior mirror (without memory)	C625-6	GD139 (BK/YE)
RH exterior mirror (with memory)	C626-7	GD139 (BK/YE)
LH exterior mirror (without memory)	C517-6	GD126 (BK/WH)
LH exterior mirror (with memory)	C522-7	GD126 (BK/WH)

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror for the suspect exterior mirror. REFER to **REAR VIEW MIRRORS** article. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test J: The Courtesy Lamps Are Inoperative From The Instrument Panel Dimmer Switch

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors the instrument panel dimmer switch status on circuit CLN28 (GN/BU) to determine if the courtesy lamps are requested. Based on the instrument panel dimmer switch status, the SJB supplies voltage to the courtesy lamps through circuit CLN26 (BU).

This pinpoint test is intended to diagnose the following:

- Dimmable back lighting illumination system concern
- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB

PINPOINT TEST J: THE COURTESY LAMPS ARE INOPERATIVE FROM THE INSTRUMENT PANEL DIMMER SWITCH

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

J1 CHECK THE DIMMABLE BACK LIGHTING ILLUMINATION

- Key in ON position.
- Turn the headlamps switch to the PARKING LAMPS ON position.
- Rotate the instrument panel dimmer switch and observe the instrument cluster illumination.
- **Does the instrument cluster illumination intensity agree with the instrument panel dimmer switch position?**

  YES : Go to J2.

  NO : REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article to continue diagnosis of the dimmable back lighting illumination.

J2 CHECK THE DIMMER SWITCH

- Key in OFF position.
- Disconnect: Dimmer Switch C2065

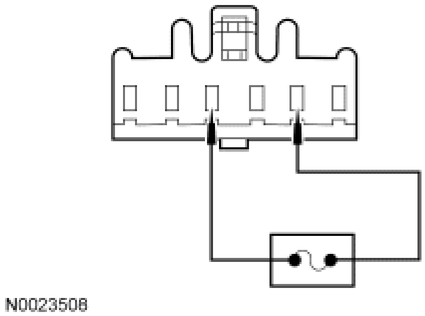

Fig. 5: Checking Dimmer Control Switch
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between the dimmer switch C2065-2, circuit CLN28 (BN/BU), harness side and the dimmer switch C2065-4, circuit CLN27 (WH/BN), harness side.
- **Do the courtesy lamps illuminate?**

  YES : INSTALL a new instrument panel dimmer switch. REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article. TEST the system for normal operation.

  NO : REMOVE the jumper wire. Go to J3.

J3 CHECK CIRCUIT CLN28 (GN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: Instrument Panel Dimmer Switch C2065
- Disconnect: SJB C2280d

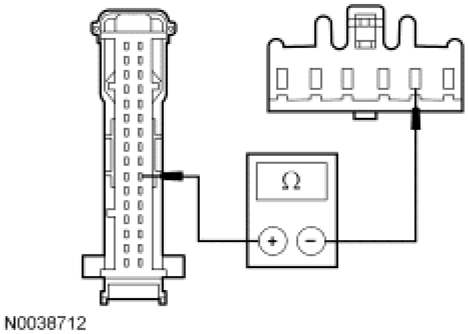

Fig. 6: Checking Circuit CLN28 (GN/BU) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-26, circuit CLN28 (GN/BU), harness side and the instrument panel dimmer switch C2065-2, circuit CLN28 (GN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to J4.

  NO : REPAIR the circuit. TEST the system for normal operation.

J4 CHECK FOR CORRECT SJB OPERATION

- Connect: Instrument Panel Dimmer Switch C2065 (If Disconnected)
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The Ambient Lighting Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The ambient lighting module and switch receive voltage from the accessory delay relay on circuit CBX07 (GN/RD), which is circuit CBP02 (GN) at the smart junction box (SJB). The ambient lighting module supplies voltage and ground to the LEDs, located in the floor console. The ambient lighting switch can cycle through 7

color combinations or turn the ambient lighting off by sending a voltage signal to the ambient lighting module through circuit CLN54 (BN/YE). There are 3 different color LEDs (red, blue, and green) housed within each LED assembly. Ground is provided to the module and switch through circuit GD116 (BK/VT), which is circuit GD908 (BK) at the module and switch.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient lighting switch
- Ambient lighting module

PINPOINT TEST K: THE AMBIENT LIGHTING IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

K1 CHECK CIRCUIT CBP08 (GY/YE)/CBX07 (GN/RD) FOR AN OPEN (TO AMBIENT LIGHTING MODULE)

- Key in OFF position.
- Disconnect: Ambient Lighting Module C3251
- Key in ON position.

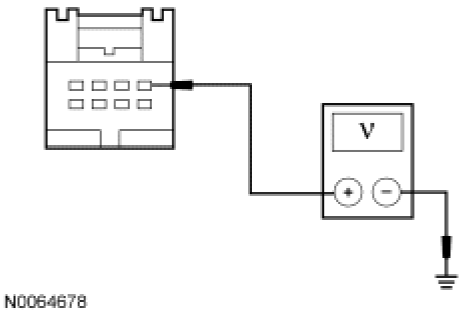

Fig. 7: Checking Circuit CBP08 (GY/YE)/CBX07 (GN/RD) For An Open (To Ambient Lighting Module)
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ambient lighting module C3251-1, circuit CBX07 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to K2.

  NO : REPAIR circuit CBX07 (GN/RD) or CBP08 (GY/YE). TEST the system for normal operation.

K2 CHECK THE INPUT FROM CIRCUIT CLN54 (BN/YE)

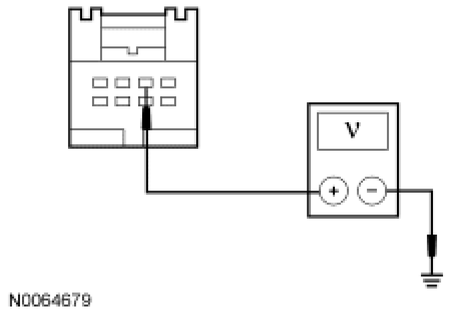

Fig. 8: Checking Input From Circuit CLN54 (BN/YE)
Courtesy of FORD MOTOR CO.

- While pressing and releasing the ambient lighting switch, measure the voltage between the ambient lighting module C3251-2, circuit CLN54 (BN/YE), harness side and ground.
- **Is the voltage greater than 10 volts with the switch pressed, and 0 volts with the switch released?**

  YES : Go to K3.

  NO : If voltage is always present, go to K4.

  If no voltage is present, go to K5.

K3 CHECK CIRCUIT GD908 (BK)/GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.

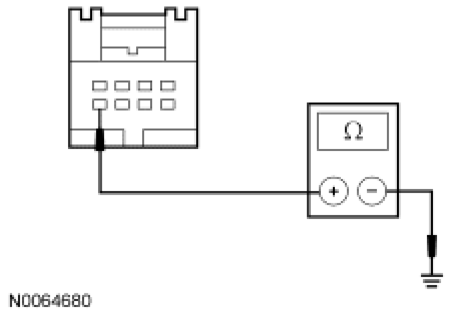

Fig. 9: Checking Circuit GD908 (BK)/GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the ambient lighting module C3251-8, circuit GD908 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to K7.

  NO : REPAIR circuit GD908 (BK) or GD116 (BK/VT). TEST the system for normal operation.

K4 CHECK CIRCUIT CLN54 (BN/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.

- Disconnect: Ambient Lighting Switch C3250
- Key in ON position.

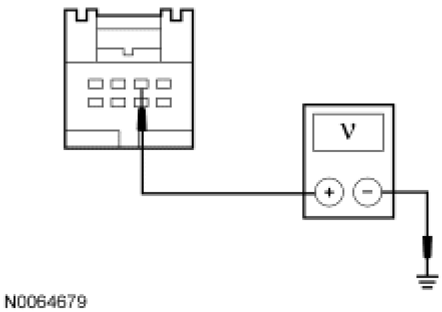

Fig. 10: Checking Circuit CLN54 (BN/YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ambient lighting module C3251-2, circuit CLN54 (BN/YE), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new ambient lighting switch. REFER to **Ambient Lighting Switch**. TEST the system for normal operation.

K5 CHECK CIRCUIT CBX07 (GN/RD) FOR AN OPEN (TO THE AMBIENT LIGHTING SWITCH)

- Disconnect: Ambient Lighting Switch C3250

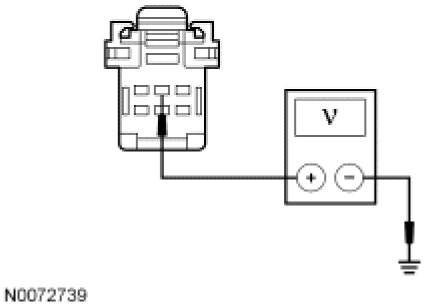

Fig. 11: Checking Circuit CBX07 (GN/RD) For An Open (To The Ambient Lighting Switch)
Courtesy of FORD MOTOR CO.

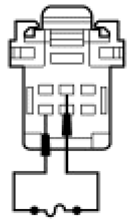
- Measure the voltage between the ambient lighting switch C3250-2, circuit CBX07 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to K6.

  NO : REPAIR the circuit. TEST the system for normal operation.

K6 CHECK THE AMBIENT LIGHTING SWITCH

- Connect: Ambient Lighting Module C3251



N0075641

Fig. 12: Checking Ambient Lighting Switch
Courtesy of FORD MOTOR CO.

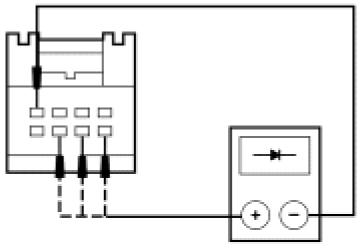
- Connect and remove a fused jumper wire between the ambient lighting switch C3250-2, circuit CBX07 (GN/RD), harness side and the ambient lighting switch C3250-6, circuit CBX07 (GN/RD), harness side.
- **Do the ambient lighting LEDs illuminate and cycle through a color change each time the jumper wire is connected and removed?**

  YES : INSTALL a new ambient lighting switch. REFER to **Ambient Lighting Switch**. TEST the system for normal operation.

  NO : REPAIR circuit CLN54 (BN/YE) for an open. TEST the system for normal operation.

K7 CHECK THE AMBIENT LIGHTING HARNESS

- Key in OFF position.



N0064681

Fig. 13: Checking Diode Circuits
Courtesy of FORD MOTOR CO.

- Check the diode circuits between the ambient lighting module, harness side as follows:

Connector-Pin/Circuit	Connector-Pin/Circuit
C3251-5 CLN45 (GN)	C3251-4 RLN44 (BN)

C3251-6 CLN45 (GN)	C3251-4 RLN44 (BN)
C3251-7 CLN44 (OG)	C3251-4 RLN44 (BN)

- **Does the meter indicate that each circuit is OK?**

  YES : Go to K8.

  NO : INSTALL a new ambient lighting harness. TEST the system for normal operation.

K8 CHECK FOR CORRECT AMBIENT LIGHTING MODULE OPERATION

- Connect: Ambient Lighting Switch C3250
- Disconnect the ambient lighting module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the ambient lighting module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ambient lighting module. REFER to **Ambient Lighting Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Ambient Lighting Does Not Cycle Through All Color Combinations

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The ambient lighting switch sends a voltage signal to the ambient lighting module on circuit CLN54 (BN/YE) when the switch is pressed. Each press of the switch either changes the color or turns the system off/on.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient lighting switch
- Ambient lighting module

PINPOINT TEST L: THE AMBIENT LIGHTING DOES NOT CYCLE THROUGH ALL COLOR COMBINATIONS

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

L1 CHECK THE INPUT FROM CIRCUIT CLN54 (BN/YE)

- Key in OFF position.
- Disconnect: Ambient Lighting Module C3251
- Key in ON position.

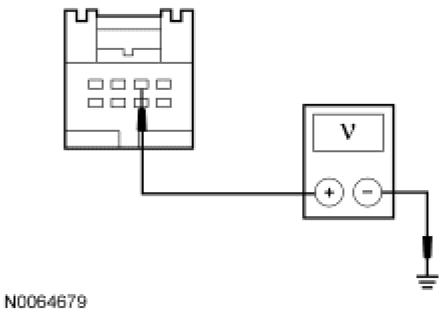


Fig. 14: Checking Input From Circuit CLN54 (BN/YE)
Courtesy of FORD MOTOR CO.

- While pressing and releasing the ambient lighting switch, measure the voltage between the ambient lighting module C3251-2, circuit CLN54 (BN/YE), harness side and ground.
- **Is the voltage greater than 10 volts with the switch pressed, and 0 volts with the switch released?**

  YES : Go to L2.

  NO : If voltage is always present, go to L3.

  If no voltage is present, go to L4.

L2 CHECK THE AMBIENT LIGHTING HARNESS

- Key in OFF position.

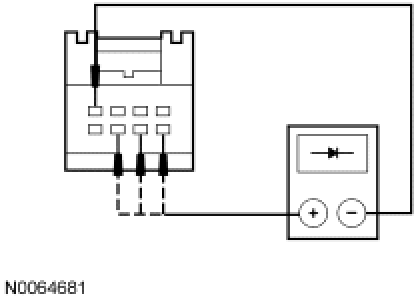

Fig. 15: Checking Diode Circuits
Courtesy of FORD MOTOR CO.

- Check the diode circuits between the ambient lighting module, harness side as follows:

Connector-Pin/Circuit	Connector-Pin/Circuit
C3251-5 CLN45 (GN)	C3251-4 RLN44 (BN)
C3251-6 CLN45 (GN)	C3251-4 RLN44 (BN)
C3251-7 CLN44 (OG)	C3251-4 RLN44 (BN)

- **Does the meter indicate that each circuit is OK?**

  YES : Go to L6.

  NO : REPAIR or INSTALL a new ambient lighting harness. TEST the system for normal operation.

L3 CHECK CIRCUIT CLN54 (BN/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Ambient Lighting Switch C3250
- Key in ON position.

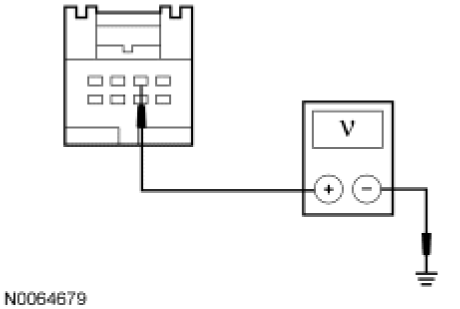

Fig. 16: Checking Circuit CLN54 (BN/YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ambient lighting module C3251-2, circuit CLN54 (BN/YE), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new ambient lighting switch. REFER to **Ambient Lighting Switch**. TEST the system for normal operation.

L4 CHECK CIRCUIT CPX07 (GN/RD) FOR AN OPEN (TO THE AMBIENT LIGHTING SWITCH)

- Key in OFF position.
- Disconnect: Ambient Lighting Switch C3250
- Key in ON position.

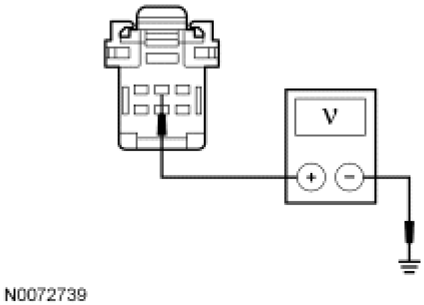

Fig. 17: Checking Circuit CPX07 (GN/RD) For An Open (To The Ambient Lighting Switch)
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ambient lighting switch C3250-2, circuit CBX07 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to L5.

  NO : REPAIR the circuit. TEST the system for normal operation.

L5 CHECK THE AMBIENT LIGHTING SWITCH

- Connect: Ambient Lighting Module C3251

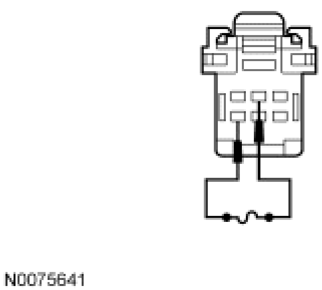

Fig. 18: Checking Ambient Lighting Switch
Courtesy of FORD MOTOR CO.

- Connect and remove a fused jumper wire between the ambient lighting switch C3250-2, circuit CBX07 (GN/RD), harness side and the ambient lighting switch C3250-6, circuit CLN54 (BN/YE), harness side.
- **Do the ambient lighting LEDs illuminate and cycle through a color change each time the jumper wire is connected and removed?**

  YES : INSTALL a new ambient lighting switch. REFER to **Ambient Lighting Switch**. TEST the system for normal operation.

NO : REPAIR circuit CLN54 (BN/YE) for an open. TEST the system for normal operation. TEST the system for normal operation.

L6 CHECK FOR CORRECT AMBIENT LIGHTING MODULE OPERATION

- Connect: Ambient Lighting Switch C3250
- Disconnect the ambient lighting module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the ambient lighting module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ambient lighting module. REFER to **Ambient Lighting Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

REMOVAL AND INSTALLATION

INTERIOR LAMP - FRONT

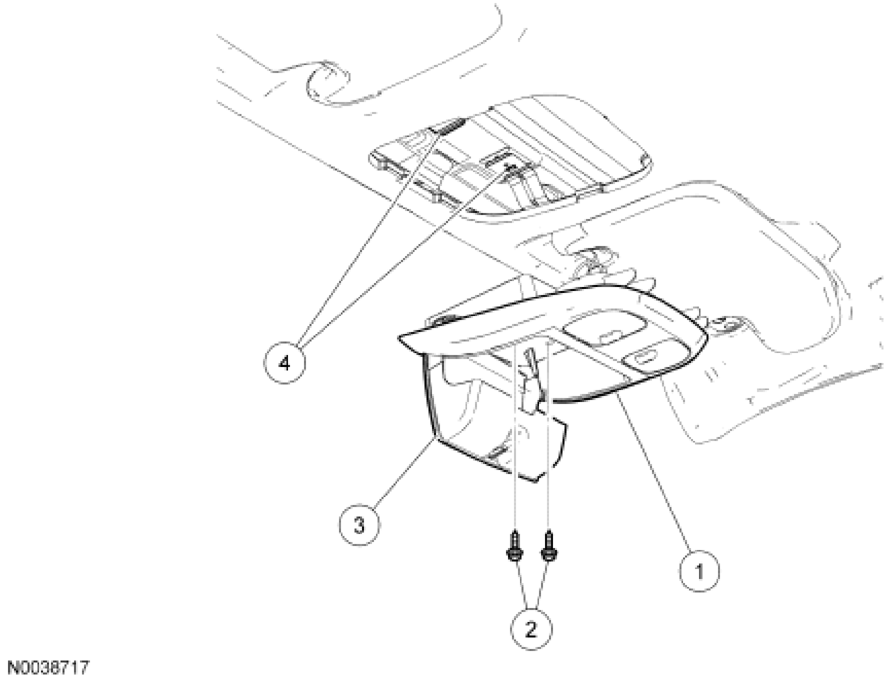

Fig. 19: Exploded View Of Front Interior Lamp
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	54519A70	Overhead console
2	-	Overhead console screws (2 required)
3	-	Overhead console storage door (part of 54519A70)
4	-	Overhead console retainer brackets

REMOVAL AND INSTALLATION

1. Open the overhead console storage door to access the screws.
   - Remove the 2 screws.
2. Pull the overhead console down and remove the console from the headliner retainer.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

INTERIOR LAMP - REAR

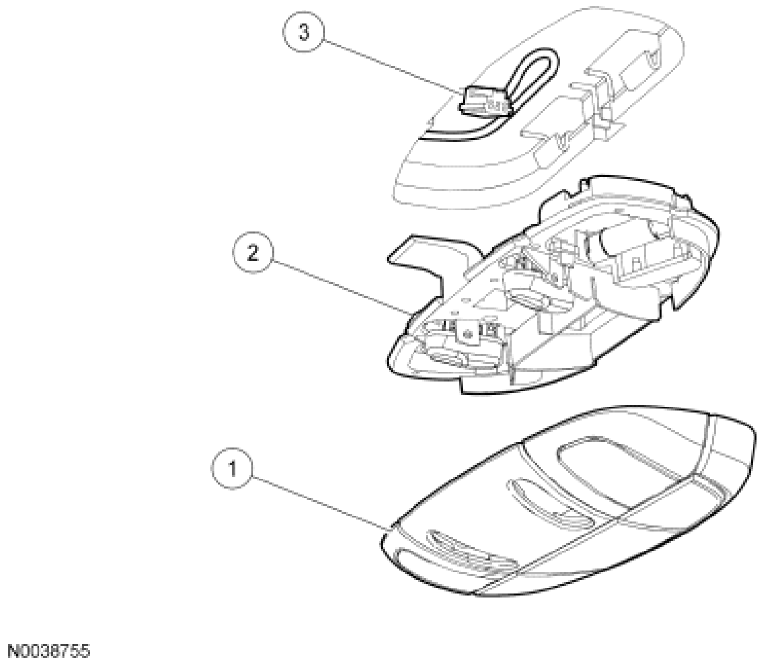

Fig. 20: Exploded View Of Rear Interior Lamp
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13783	Rear interior lamp lens
2	13776	Rear interior lamp
3	-	Rear interior lamp electrical connector

		(part of 14334)

REMOVAL AND INSTALLATION

1. Remove the rear interior lamp lens.

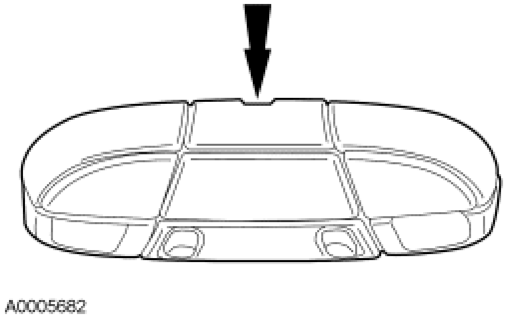

Fig. 21: Identifying Rear Interior Lamp Lens
Courtesy of FORD MOTOR CO.

2. Release the 2 retaining clips (through the access holes) and remove the rear interior lamp assembly.
   - Disconnect the electrical connector.

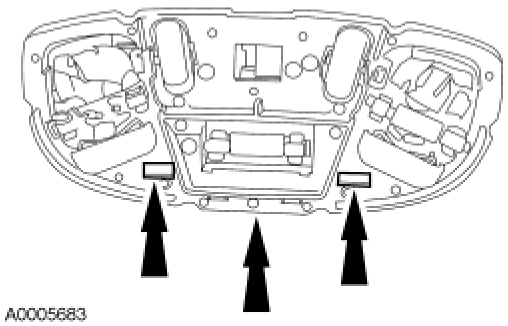

Fig. 22: Locating Electrical Connector Retaining Clips
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

AMBIENT LIGHTING MODULE

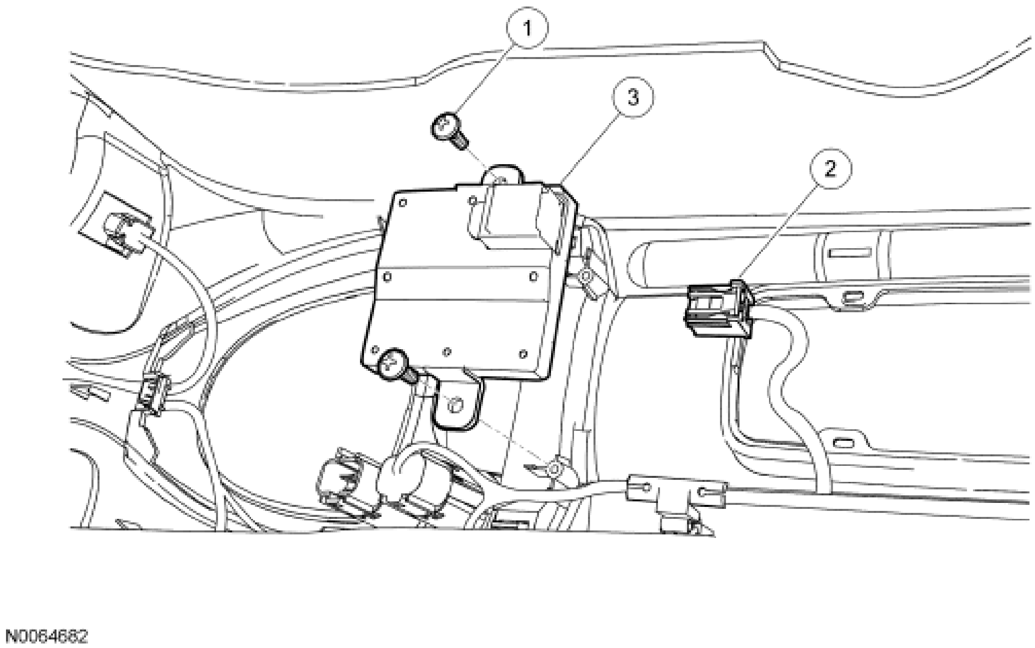

Fig. 23: Identifying Ambient Lighting Module Components
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701679	Ambient lighting module screws (2 required)
2	-	Ambient lighting module electrical connector (part of 14D375)
3	13C788	Ambient lighting module

REMOVAL AND INSTALLATION

1. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Remove the 2 screws and the ambient lighting module.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

AMBIENT LIGHTING SWITCH

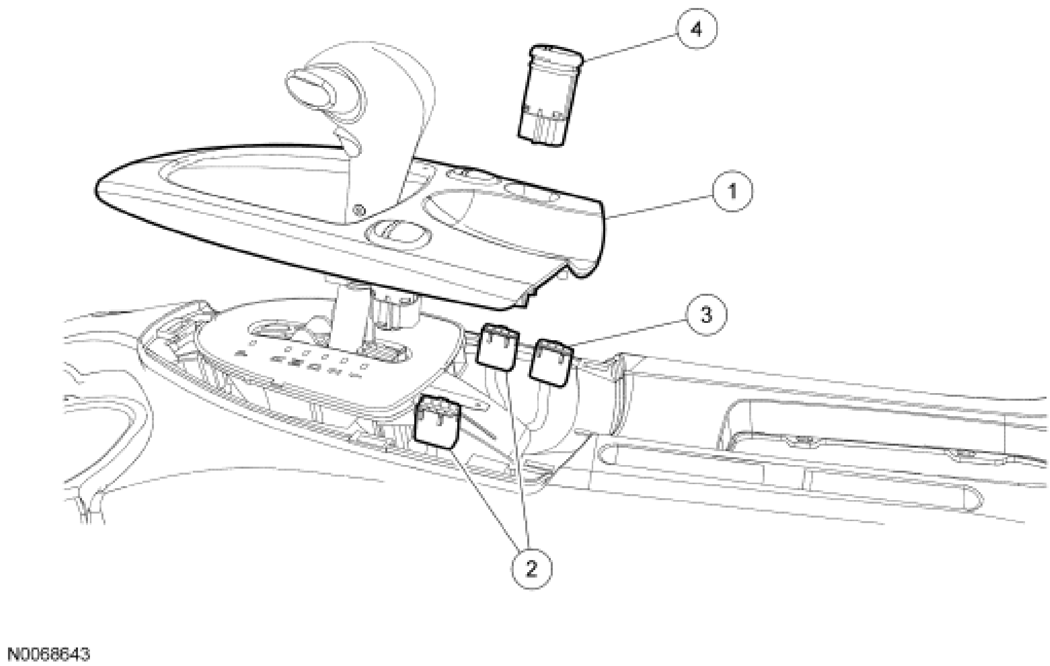

Fig. 24: Identifying Ambient Lighting Switch Components
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	044D90	Floor console trim panel
2	-	Center console electrical connectors (part of 14014)
3	-	Ambient lighting switch electrical connector (part of 14D375)
4	-	Ambient lighting switch

REMOVAL AND INSTALLATION

NOTE: The trim panel is removed by grasping the sides and pulling upward.

1. Remove the floor console trim panel.
   - Disconnect the electrical connectors.
2. Squeeze the retaining tabs and remove the ambient lighting switch.
3. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Interior Trim & Ornamentation - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in

Child seat tether anchor bolts	22	16	-
Safety belt bolt	54	40	-

REMOVAL AND INSTALLATION

INTERIOR TRIM - EXPLODED VIEW

NOTE: **Fusion shown, Milan and MKZ similar.**

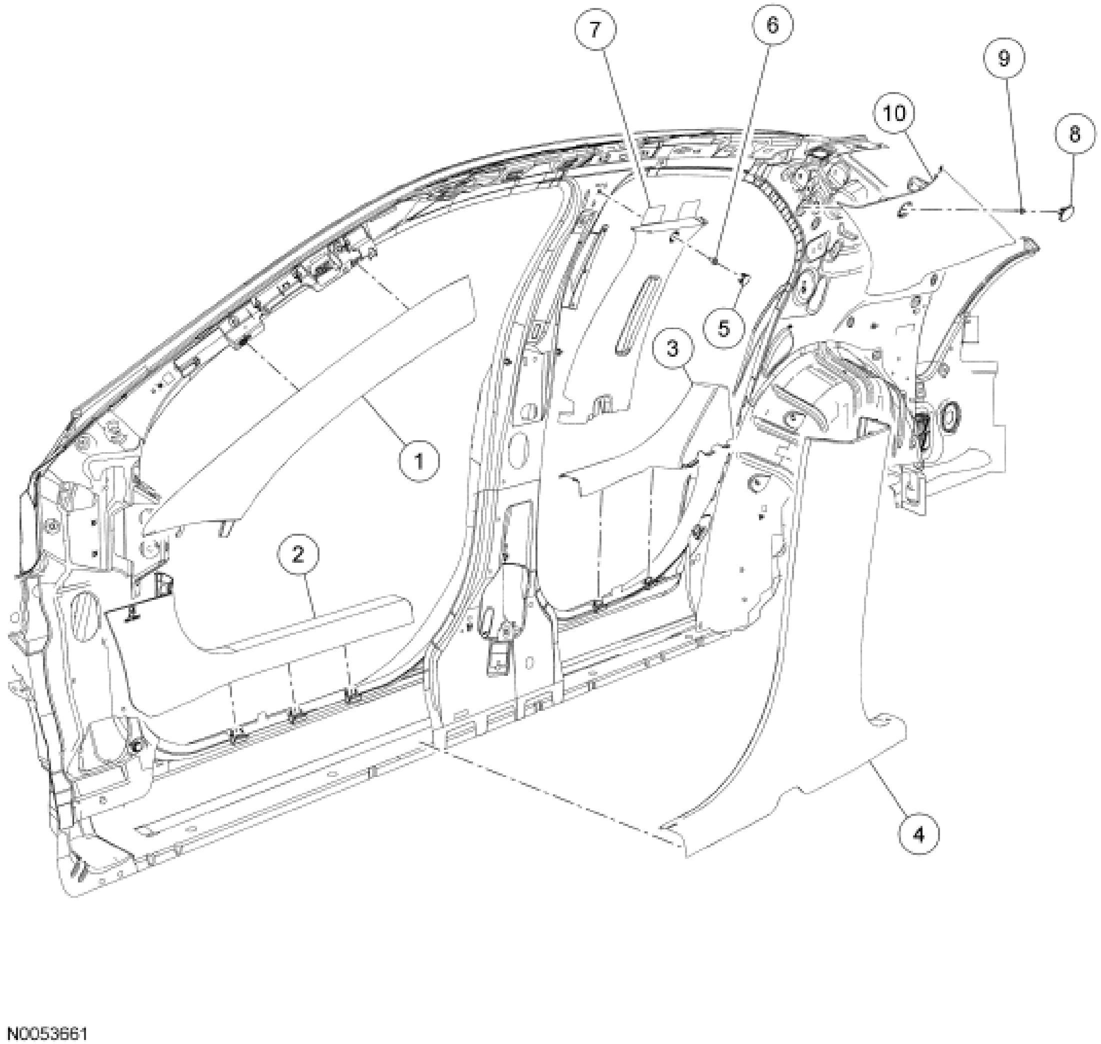

Fig. 1: Exploded View Of Interior Trim
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	03598 RH/ 03599 LH	A-pillar trim panel
2	13208 RH/ 13209 LH	Front door scuff plate
3	13228 RH/ 13229 LH	Rear door scuff plate
4	24346 RH/ 24347 LH	B-pillar lower trim panel
5	672A40A	B-pillar trim panel screw cover
6	W705604	B-pillar trim panel screw
7	24356 RH/ 24357 LH	B-pillar upper trim panel
8	672A40B	C-pillar trim panel screw cover
9	W705604	C-pillar trim panel screw
10	52018 RH/ 52019 LH	C-pillar trim panel

1. For additional information, refer to the procedures.

A-PILLAR TRIM PANEL

NOTE: This procedure is for vehicles equipped with side air curtains. On vehicles without side air curtains, the A-pillar trim panel is easier to remove and the retainers are reusable.

NOTE: The A-pillar trim panel is held in place by a clip that is snapped to the back of the panel. When installing the existing trim panel, a new clip must be installed.

NOTE: When removing the A-pillar trim panel, use a gentle side-to-side rocking motion to free the clip from the trim panel.

1. Remove the A-pillar trim panel and the clip from the sheet metal.
   - Use a new A-pillar trim panel clip when installing.
2. To install, reverse the removal procedure.
   - Align attachment clips to the holes and snap in place.

B-PILLAR TRIM PANEL

REMOVAL AND INSTALLATION

1. Position the front seats in the full forward position.

NOTE: Inspect the safety belt D-ring cover for damage. If the safety belt D-ring cover does not remain in place, install a new cover.

2. Remove the safety belt D-ring cover and remove the safety belt bolt.
   - To install, tighten to 54 Nm (40 lb-ft).
3. Position the front and rear door weatherstrips aside.
4. Remove the front door scuff plate trim panel.
5. Remove the rear door scuff plate trim panel.
6. Remove the lower B-pillar trim panel.
   - Slide the lower B-pillar trim panel down to disengage it from the upper B-pillar trim panel.
7. Remove the upper B-pillar trim panel.
   - Remove the screw cover.
   - Remove the screw.

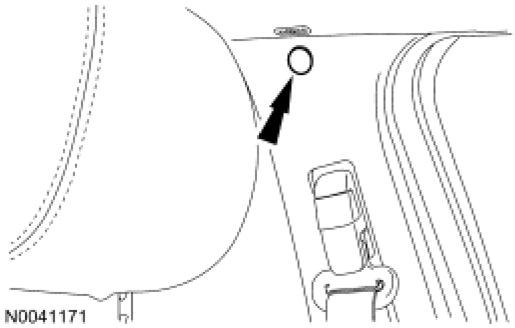

Fig. 2: Locating Screw Cover
Courtesy of FORD MOTOR CO.

8. To install, reverse the removal procedure.

C-PILLAR TRIM PANEL

REMOVAL AND INSTALLATION

1. Position the rear door weatherstrip aside.
2. Remove the screw cover.
3. Remove the screw.
4. Remove the C-pillar trim panel.
5. To install, reverse the removal procedure.

DOOR TRIM PANEL - FRONT

NOTE: Fusion shown, Milan and MKZ similar.

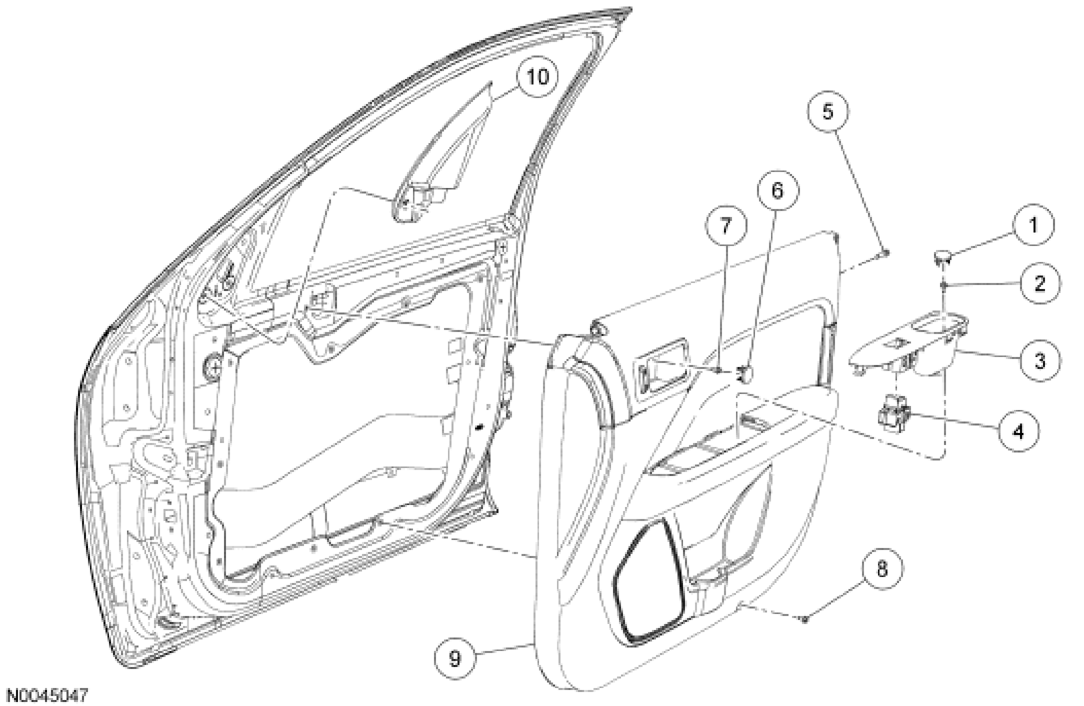

Fig. 3: Exploded View Of Front Door Trim Panel
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Front door inside handle bezel screw cover
2	W703268	Front door inside handle bezel screw
3	54266B	Front door inside handle bezel
4	14529B	Front door window switch
5	W706476	Front door trim panel upper screw
6	-	Front door handle screw cover
7	W505942	Front door handle screw
8	W706476	Front door trim panel lower screw
9	5423942	Front door trim panel
10	17K709	Front door trim sail panel

REMOVAL AND INSTALLATION

NOTE: RH side shown, LH side similar.

1. Remove the front door handle bezel screw cover.
2. Remove the front door inside handle bezel screw.
3. Remove the front door inside handle bezel.
    - Lift upward on the rear of the front door inside handle bezel.

- Disconnect the electrical connector.

4. Remove the front door handle screw cover.
5. Remove the front door handle screw.
6. Remove the front door trim panel upper screw.
7. Remove the front door trim panel lower screw.

NOTE: The back of the front door trim panel shown with the location of the front door trim panel pin-type retainers indicated.

8. Remove the front door trim panel.
   - Pull the front door trim panel outward to release the front door trim panel pin-type retainers.
   - Disconnect the electrical connector.

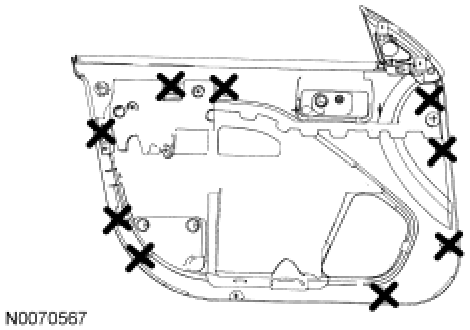

Fig. 4: Locating Front Door Trim Panel Pin-Type Retainers
Courtesy of FORD MOTOR CO.

9. To install, reverse the removal procedure.

DOOR TRIM PANEL - REAR

NOTE: Fusion shown, Milan and MKZ similar.

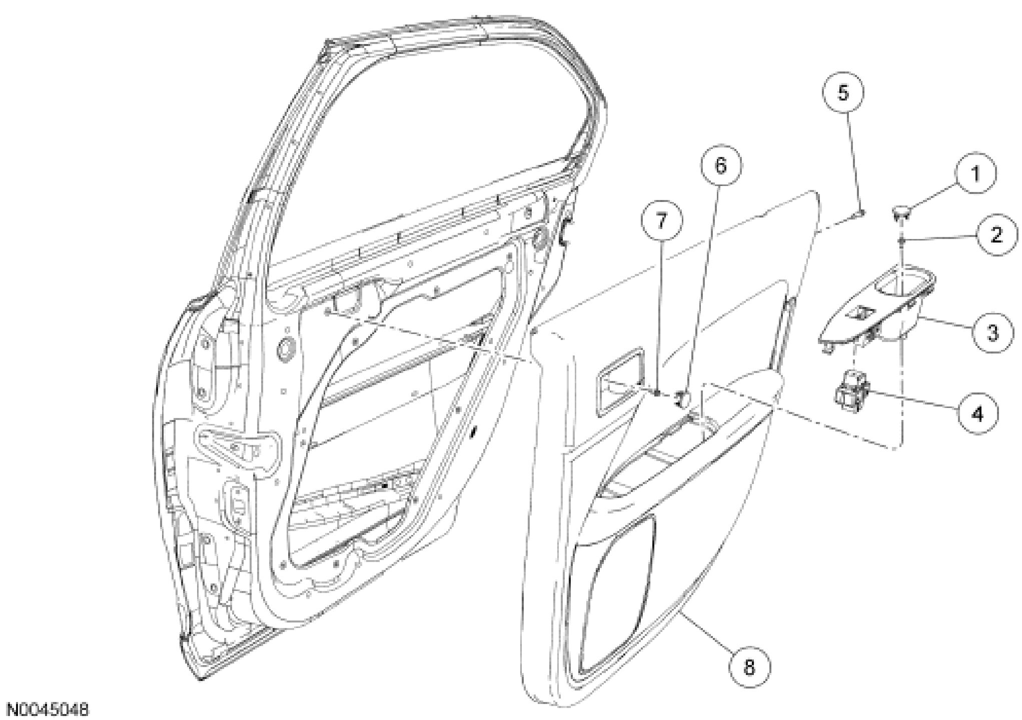

Fig. 5: Exploded View Of Rear Door Trim Panel
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Rear door inside handle bezel screw cover
2	W703268	Rear door inside handle bezel screw
3	54266	Rear door inside handle bezel
4	14529	Rear door window switch
5	W505942	Rear door trim panel upper screw
6	-	Rear door handle screw cover
7	W706476	Rear door handle screw
8	5427406	Rear door trim panel

REMOVAL AND INSTALLATION

NOTE: RH side shown, LH side similar.

1. Remove the rear door inside handle bezel screw cover.
2. Remove the upper rear door inside handle bezel screw.
3. Remove the rear door inside handle bezel.
   - Lift upward on the rear of the rear door inside handle bezel.
   - Disconnect the electrical connector.
4. Remove the rear door handle screw cover.

5. Remove the rear door handle screw.
6. Remove the rear door trim panel upper screw.

NOTE: **The back of the rear door trim panel shown with the location of the rear door trim panel pin-type retainers indicated.**

7. Remove the rear door trim panel.
   - Pull the rear door trim panel outward to release the rear door trim panel pin-type retainers.

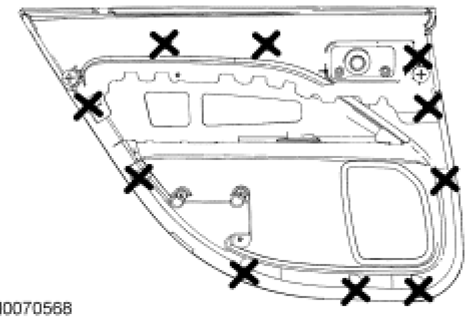

Fig. 6: Locating Rear Door Trim Panel Pin-Type Retainers
Courtesy of FORD MOTOR CO.

8. To install, reverse the removal procedure.

HEADLINER

NOTE: **Headliner with moon roof shown, headliner without moon roof similar.**

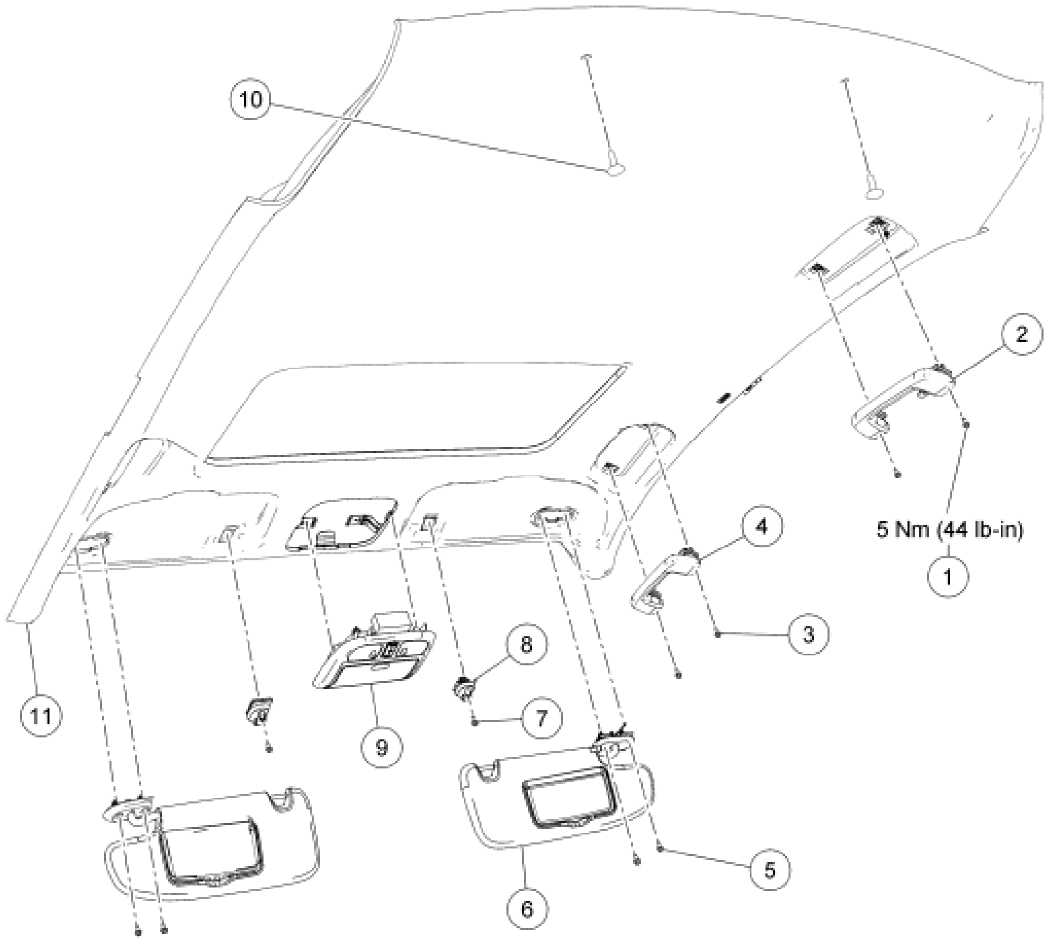

Fig. 7: Exploded View Of Headliner With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W504265	Assist handle bolt (2 required)
2	31406B RH/ 31407B LH	Rear assist handle
3	W504265	Assist handle bolt (2 required)
4	31406A RH/ 31407A LH	Front assist handle
5	W505003	Sun visor screw (2 required)
6	04104 RH/ 04105 LH	Sun visor
7	W505003	Sun visor arm clip screw
8	04132	Sun visor arm clip
9	519A70	Overhead console
10	W709571	Push pin retainer (2 required)

11	51916	Headliner

REMOVAL AND INSTALLATION

1. Remove the driver seat and rear seat cushion. For additional information, refer to **SEATING** article.
2. Position the passenger seat fully rearward and recline fully.
3. Open the 4 passenger assist handle covers.
    - Remove the bolts and remove the handles.
        - To install, tighten to 5 Nm (44 lb-in).

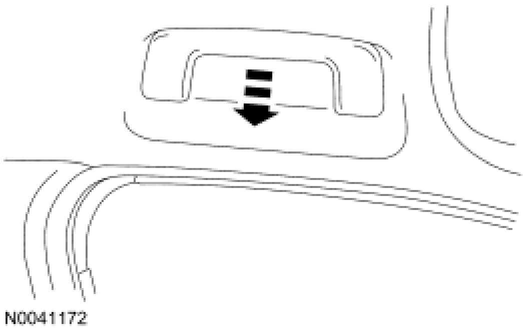

Fig. 8: Removing Handles
Courtesy of FORD MOTOR CO.

4. Remove the A-pillar trim panels. For additional information, refer to **A-Pillar Trim Panel**.
5. Disconnect the wire harness connector and the 2 pushpins.

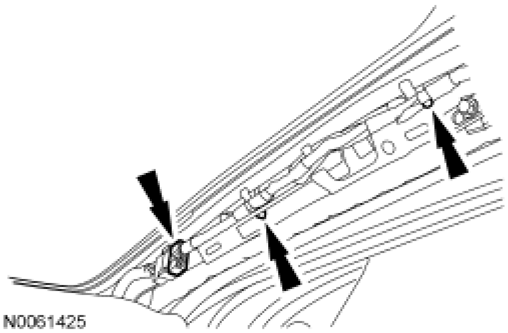

Fig. 9: Locating Wire Harness Pushpins
Courtesy of FORD MOTOR CO.

6. If equipped, disconnect the automatic dimming rear view mirror electrical connectors.

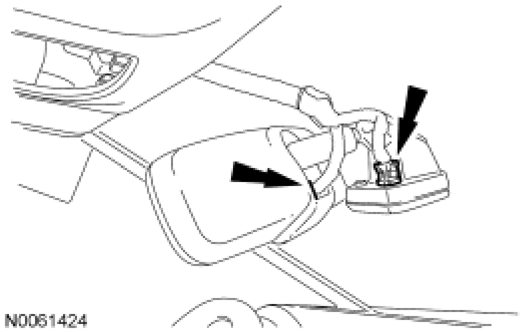

Fig. 10: Locating Rear View Mirror Electrical Connectors
Courtesy of FORD MOTOR CO.

7. Remove the B-pillar trim panels. For additional information, refer to **B-Pillar Trim Panel**.
8. Remove the C-pillar trim panels. For additional information, refer to **C-Pillar Trim Panel**.
9. Remove the overhead console.
   - Disconnect the electrical connector.
10. Remove the sun visors and the sun visor clips.
    - If equipped, disconnect the electrical connectors.
11. Remove the 2 headliner push pin retainers at the rear.
12. If equipped, position the headliner forward to gain access to disconnect the roof opening panel motor electrical connector.

NOTE: To avoid bending or crimping the headliner, an assistant is required for this step.

13. Remove the headliner through the LH rear door.
14. To install, reverse the removal procedure.

PARCEL SHELF

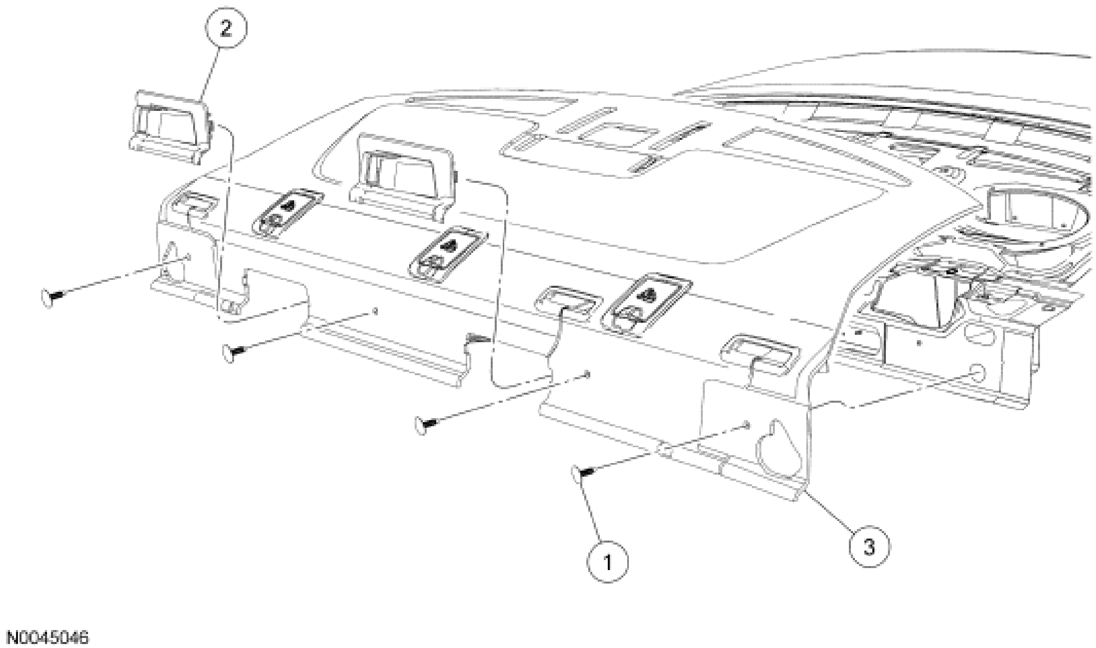

Fig. 11: Exploded View Of Parcel Shelf
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W706635	Parcel shelf push pin (4 required)
2	63874	Parcel shelf seat belt guide (2 required)
3	46668	Parcel shelf

REMOVAL AND INSTALLATION

1. Remove the C-pillar trim panels. For additional information, refer to **C-Pillar Trim Panel**.
2. Remove the rear seat bolsters. For additional information, refer to **SEATING** article.
3. Fold the rear seats down.
4. Remove the seat back latch covers.
5. Remove the high mounted stoplamp. For additional information, refer to **EXTERIOR LIGHTING** article.
6. Remove the 4 pushpins.
7. Thread the seat belts through the guides.
8. To install, reverse the removal procedure.

REMINDER INDICATOR RESET PROCEDURES

Shelby models are not equipped with the oil life monitor option.

(1)

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 1

Oil Life Reset:

1. Press the SETUP button to display PRESS SELECT TO BEGIN SYSTEM CHECK.
2. Press the SELECT button to display OIL LIFE - PRESS RESET IF NEW OIL.
3. Press and hold the RESET button until OIL LIFE SET TO 100% is displayed.

Oil Life Start Value:

1. Press the SETUP button until OIL LIFE START VALUE PRESS SELECT TO CHANGE is displayed.
2. Press and release the SELECT button until the desired start value is displayed.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 2

Oil Life Reset - Base Instrument Cluster

1. Press and release the ODO/TRIP button to toggle between the odometer and trip odometer displays.
2. Press and release the ODO/TRIP button again to toggle between the trip odometer display and the OIL LIFE XX% display.
3. Press and hold the ODO/TRIP button for approximately 2 seconds or longer until OIL LIFE 100% is displayed.
4. Press and release the ODO/TRIP button to return to the odometer display.

Oil Life Reset - Message Center Instrument Cluster

1. Press and release the SETUP button until OIL LIFE XX% RESET IF NEW is displayed.
2. Press and release the RESET button until IF NEW OIL HOLD RESET is displayed (On Freestar & Freestyle: HOLD RESET TO CONFIRM).
3. Press and hold the RESET button until OIL LIFE SET TO 100% is displayed.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 3

Oil Life Reset:

NOTE: The XXX's in the steps below represent a numeric value and displays the correct number in a percentage. For example, OIL LIFE = XXX% may display OIL LIFE = 45%.

1. Press and release the SETUP button until SYSTEM CHECK is displayed.
2. Press and release the SETUP button again to display OIL LIFE = XXX% HOLD RESET = NEW.
3. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%. "OIL LIFE SET

TO 100%" is displayed.

Oil Life Start Value:

NOTE: The oil life start value is used to reset the oil life value back to the maximum if the value was previously changed, or to lower the value by 10% increments down to 10%.

1. Press and release the SETUP button until SYSTEM CHECK is displayed.
2. Press and release the SETUP button again to display OIL LIFE = XXX% HOLD RESET = NEW.
3. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.
4. Press and release the RESET button to lower the percentage by 10% (down to 10%) for each button press or return the value to 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 4

Oil Life Reset:

1. Press and release the SETUP button twice until OIL LIFE = XXX% HOLD RESET = NEW is displayed.
2. Press and hold the RESET button for 2 seconds until OIL LIFE SET TO 100% is displayed to reset the oil life to 100%

Oil Life Start Value:

NOTE: The oil life start value is used to reset the oil life value back to the maximum if the value was previously changed, or to lower the value by 10% increments down to 10%.

1. Press and release the SETUP button twice until OIL LIFE = XXX% HOLD RESET = NEW is displayed.
2. Press and hold the RESET button for 2 seconds until OIL LIFE SET TO 100% is displayed to reset the oil life to 100%.
3. Release the RESET button then press and release the RESET button to lower the percentage by 10% (down to 10%) for each button press or return the value to 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 5

NOTE: This procedure resets the oil life telltale in the Instrument Panel Cluster (IPC), and the oil change reminder message in the message center display.

1. Turn the ignition switch to the RUN position (do not start the engine)

   NOTE: For vehicles with push-button start, press and hold the start button for two seconds without pressing the brake pedal. Do not attempt to start the engine.

2. Press the brake and accelerator pedals at the same time.
3. Keep the pedals fully depressed.
4. After three seconds, the "Service: Oil reset in prog." message will be displayed.
5. After 25 seconds, the "Service: Oil reset complete" message will be displayed.
6. Release both the accelerator and brake pedals.
7. The "Service: Oil reset complete" message will no longer be displayed.
8. Rotate the key to the OFF position.

NOTE: For vehicles with push-button start, push the start/stop switch to turn the vehicle off completely.

9. Start the vehicle. Make sure that the oil life telltale is not illuminated in the IPC, and the oil change reminder message is no longer displayed in the message center.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 6

Non-Hybrid

Oil Life Reset:

NOTE: The oil life calculation is set at a maximum of approximately 12,070 km (7,500 miles) or 180 days (non-hybrid) or 16,093 km (10,000 miles) (hybrid).

1. Press and release the SETUP button to display OIL LIFE XXX% HOLD RESET = NEW.
2. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.

NOTE: Oil Life Start Value: The oil life start value is used to reset the oil life value back to the if the value was previously changed, or to lower the value from the maximum in 10% increments down to 10%. To change oil life value to another value, proceed to next step.

3. Once "OIL LIFE SET TO XXX%" is displayed, release and press the RESET button to change the Oil Life Start Value. Each release and press will reduce the value by 10%.

Hybrid

Oil Life Reset And Oil Life Start Value

NOTE: The oil life calculation is set at a maximum of approximately 16,093 km (10,000 miles) or 12 months.

NOTE: The message center is displayed on the LH side of the speedometer and is split into several different viewing panes.

1. Press and release the SETUP button to display VEHICLE SETTINGS in the LH viewing pane of the message center.
2. Press and release the RESET button to display the next viewing pane.
3. Press and release the SETUP button to select and highlight OIL LIFE in the LH viewing pane of the message center.

NOTE: Once the RESET button is pressed, the message center highlights the currently selected oil life start value. This value can be changed or left as currently selected.

4. Press and release the RESET button to display the move to the RH viewing pane of the message center and highlight SET TO xxx%.
5. Press and release the SETUP button to highlight the desired oil life start value.

NOTE: A pop-up window appears stating HOLD RESET FOR 2 SECONDS TO CONFIRM. PRESS INFO TO CANCEL.

6. Press and release the RESET button.
7. Press and hold the RESET button for approximately 2 seconds to select and confirm the desired oil life start value.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 7

NOTE: To reset the oil service light and clear the oil change message after servicing use the following procedure:

1. Begin with the ignition off.
2. Turn the key to the accessory position for keyed vehicles and for push button start vehicles press the Start/Stop button once quickly. DO NOT attempt to start the engine.
3. Press the brake and accelerator pedals at the same time. Hold down fully for at least 20 seconds.
4. Release both the accelerator and brake pedals.
5. ENGINE OIL CHANGE DUE NEXT SERVICE and [Wrench & Oil Can icon] will display in the message center.
6. Rotate the key to the OFF position.
7. Turn the vehicle off. The message and lights will be cleared.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 8

The message center is used to program/configure various options. The message center display is located in the instrument cluster.

Use the steering wheel controls to navigate through the message center to locate the Oil Life Reset option: *Main Menu > Settings > Convenience > Oil Life Reset* .

Press the up/down arrow buttons to move up/down through the message center choices.

Press the left/right arrow buttons to move left/right through the message center choices.

- Press the left/right, up/down arrow buttons to move through the message center choices. Select SETTINGS
- Press the left/right, up/down arrow buttons to move through the message center choices. Select CONVENIENCE
- Press the left/right, up/down arrow buttons to move through the message center choices. Select OIL LIFE RESET
- Press the left/right, up/down arrow buttons to move through the message center choices. Select Percentage - 100, 90, 80, 70, 60, 50, 40, 30, 20, or 10.
- Press the OK button to select highlighted options and confirm choices/messages.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 9

To reset oil life feature, press and hold the OIL CHANGE RESET control for 5 seconds. The message center will count down for 5 seconds. If reset is successful, message center will display OIL LIFE RESET TO 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 10

NOTE: **All message reset functions are carried out using the single stem SELECT/RESET button in the Base Instrument Panel Cluster**

NOTE: **The XX's in the message center displays below represent a numeric value. For example, the message center may display OIL LIFE = 80%.**

Oil Life Reset:

NOTE: **The ENGINE OIL CHANGE SOON message will be displayed on message center when remaining engine oil life is 5% or less. The ENGINE OIL CHANGE NOW message will be displayed when engine oil life is 0%.**

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET FOR SETUP MENU.
2. **For 2007-13 Expedition and Navigator (Message Center Cluster):** Press and hold the RESET button for approximately 2 seconds until the message center displays HOLD RESET FOR SYSTEM CHECK. **For all other models (Base Instrument Cluster), go to next step.**
3. Press and release the SELECT/RESET button until the message center displays OIL LIFE XX% HOLD RESET = NEW.
4. Press and hold the SELECT/RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO 100%.
5. Press and release the SELECT/RESET button to exit the procedure.

Oil Life Start Value:

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET FOR SETUP MENU.
2. **For 2007-13 Expedition and Navigator (Message Center Cluster):** Press and hold the RESET button for approximately 2 seconds until the message center displays HOLD RESET FOR SYSTEM CHECK. **For all other models (Base Instrument Cluster), go to next step.**
3. Press and release the SELECT/RESET button until the message center displays OIL LIFE XX% HOLD RESET = NEW.
4. Press and hold the SELECT/RESET button for 2 seconds until the message center displays OIL LIFE SET TO 100%.

NOTE: The oil life start value can be lowered from 100% to 10% in 10% increments then the value starts again at 100%.

5. Continue to hold the SELECT/RESET button to lower the oil life in 10% increments from the default 100% until the message center displays OIL LIFE SET TO XX%.
6. Press and release the SELECT/RESET button to exit the procedure.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 11

Oil Life Reset:

1. Press and release the SETUP button until the message center displays PRESS RESET AT OIL CHANGE.
2. Press and release the RESET button until the message center displays HOLD RESET TO CONFIRM.
3. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.
4. Press the SETUP to exit the procedure and continue with the system check.

Oil Life Start Value:

1. Press and release the SETUP button until the message center displays PRESS RESET AT OIL CHANGE.
2. Press and release the RESET button until the message center displays HOLD RESET TO CONFIRM.
3. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.
4. Press the RESET and the SETUP buttons simultaneously for 2 seconds until the message center displays OIL LIFE XX% RESET TO ALTER.
5. Press the RESET button to lower the percentage by 10% (up to 30%) for each button press or return the value to 100%.
6. Press the SETUP to exit the procedure and continue with the system check.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 12

With Base Instrument Cluster

Oil Life & Oil Life Start Value Reset:

1. Place the ignition in the RUN position with the engine off (KOEO).
2. Press and release the TRIP/RESET button until SETUP MENU HOLD RESET is displayed.
3. Press and hold the TRIP/RESET button until RESET FOR SYS CHECK (2006 early build) or SYSTEM CHECK HOLD RESET (2006 late build and later) is displayed.
4. Release the TRIP/RESET button.
5. Press and release the TRIP/RESET button to scroll through the system check menu items until HOLD RESET IF NEW OIL is displayed.
6. Press and hold the TRIP/RESET button until OIL LIFE SET TO 100% is displayed.

NOTE: If the oil life start value was set to 100%, the next setting would be 90%. If the oil life start value was set to 10%, the next setting would be 100%

7. Release the TRIP/RESET button. The oil life is now reset.
8. To change the oil life start value, press and hold the TRIP/RESET button until the oil life display indicates the next oil life start value.
9. Repeat Step 7 for each desired 10% reduction in the oil life start value down to 10%.

With Message Center Instrument Cluster

Oil Life Reset:

NOTE: For 2008 and later vehicles, it may be possible to start with step 2.

1. Press and release the SETUP button until the message center displays PRESS RESET TO BEGIN SYSTEM CHECK.
2. Press and release the RESET button until the message center displays HOLD RESET IF NEW OIL.
3. Press and hold the RESET button for 2 seconds until the message center displays OIL CHANGE SET TO 100%.

Oil Life Start Value Reset

1. Press and release the SETUP button until the message center displays OIL LIFE START VALUE SET TO XX%.
2. Press and release the RESET button to lower the percentage by 10% (down to 10%) for each button press or return the value to 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 13

With Message Center Instrument Cluster

Oil Life Reset

1. Press and release the SETUP button until the message center displays OIL LIFE XXX% HOLD RESET = NEW OIL.

2. Press and hold the RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO XXX%.
3. Press and release the SETUP button to exit the procedure.

Oil Life Start Value

1. Press and release the SETUP button until the message center displays OIL LIFE XXX% HOLD RESET = NEW OIL.
2. Press and hold the RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO XXX%.
3. Press and release the RESET button to decrease the oil life start value (from 100% to 10%) for each 10% reduction until the desired oil life start value is displayed.
4. Press and release the SETUP button to exit the procedure.

With Base Instrument Cluster

NOTE: All message center functions are carried out using the single stem SELECT/RESET button in the Instrument Cluster (IC).

Oil Life Reset

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET FOR SETUP MENU.
2. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE XXX% HOLD RESET = NEW.
3. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE SET TO XXX%.
4. Release the SELECT/RESET button and allow the setup timer to expire to exit the procedure.

Oil Life Start Value

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET FOR SETUP MENU.
2. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE XXX% HOLD RESET = NEW.
3. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE SET TO XXX%.

   NOTE: The oil life start value reduces by 10% for each second that the SELECT/RESET button is held once the oil life start value begins decreasing.

4. Continue to hold the SELECT/RESET button until the oil life begins to decrease in value (from 100% down to 10%), continuing to hold until the desired start value is displayed.

5. Release the SELECT/RESET button and allow the setup timer to expire to exit the procedure.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 14

The message center is used to program/configure various options. The message center display is located in the instrument cluster.

Use the left steering wheel controls to navigate through the message center to locate the Oil Life Reset option. Depending on display type, follow menu path to reset: (see **Fig. 1**)

NOTE: For Fusion, MKS, MKT, MKX, MKZ , use Type 2 instructions.

- Type 1: *Main Menu > Settings > Convenience > Oil Life Reset*
- Type 2: *Main Menu > Settings > Vehicle > Oil Life Reset*

Press the up/down arrow buttons to move up/down through the message center choices.

Press the left/right arrow buttons to move left/right through the message center choices.

- Press the left/right, up/down arrow buttons to move through the message center choices. Select SETTINGS
- Press the left/right, up/down arrow buttons to move through the message center choices. Select CONVENIENCE or VEHICLE
- Press the left/right, up/down arrow buttons to move through the message center choices. Select OIL LIFE RESET
- Press the left/right, up/down arrow buttons to move through the message center choices. Select Percentage - 100, 90, 80, 70, 60, 50, 40, 30, 20, or 10.
- Press the OK button to select highlighted options and confirm choices/messages.

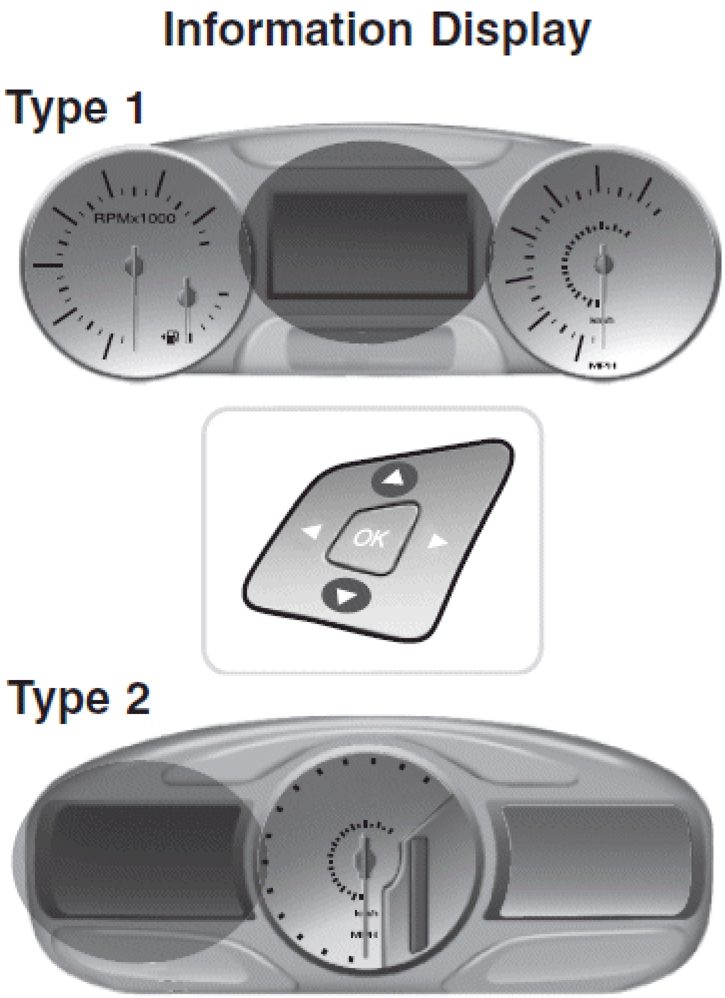

Fig. 1: Identifying Information Display Types (Edge & Flex Shown; Other Models Are Similar)
Courtesy of FORD MOTOR CO.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 15

Base Message Center

1. Press and release the SETUP button until the message center displays OIL LIFE XXX% HOLD RESET = NEW OIL.
2. Press and hold the RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO XXX%.
3. Press and release the SETUP button to exit the procedure.

NOTE: To change oil life 100% value (if equipped with this feature) to a value less than 100%, proceed to next step.

4. Once "OIL LIFE SET TO XXX%" is displayed, release and press the RESET button to change the Oil Life Start Value. Each release and press will reduce the value by 10%.

Uplevel Message Center

The message center display is located in the instrument cluster. Use the steering wheel mounted buttons to navigate through the message center to locate the Oil Life Reset option. Go to *Main Menu > Settings > Oil Life Reset* .

- Press the up/down arrow buttons to move up/down through the message center choices.
- Press the left/right arrow buttons to move left/right through the message center choices.
- Press the OK button to select highlighted options and confirm choices/messages.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 16

The warning message CHANGE OIL SOON is single cycle, non-resettable and repetitive warning messages. Single cycle warning messages will display once whenever the ignition switch is turned to ON or a fault occurs in a system and can be cleared by pressing the RESET button.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 17

1. The CHANGE OIL SOON message will be displayed on message center when remaining engine oil life is 5% or less. The OIL CHANGE REQUIRED message will be displayed when engine oil life is 0%.
2. To reset the oil monitoring system to 100%, press the STATUS control to access the System Check function. Press RESET control to reset oil percentage (%). Press and hold RESET control to change setting to 100%.
3. If reset procedure is successful, the message center will display OIL LIFE SET TO 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 18

1. The CHANGE OIL SOON warning will display on the message center when remaining engine oil life is 5% or less. The OIL CHANGE REQUIRED will display when engine oil life is 0%.
2. To reset display after oil change, press VEHICLE SETTINGS control until OIL CHANGE RESET display appears. On 1993-96 models, press OIL CHANGE RESET switch and hold for 5 seconds as message center display counts down to trigger an oil change reset. On 1997-98 models, press RESET switch for 5 seconds to reset display.
3. After a successful reset, the message center will display OIL LIFE RESET TO 100.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 19

The warning message displays once whenever the ignition switch is turned to the ON position or a fault occurs in a system and can be cleared by pressing the RESET button. Once cleared, the messages are not displayed again until the next ignition cycle.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 20

NOTE: Oil life calculation is set at a maximum of approximately 5,000 miles (8,000 kms) or 180 days.

1. Press the INFO button to cycle message to OIL CHANGE message.
2. Press the SET button to display PRESS SET FOR SYS CHCK.
3. Press and release the SET button to display OIL CHNG XXX% HOLD SET NEW.
4. Press and hold the SET button for about 2 seconds to display OIL CHANGE SET TO 100%. The oil life is now set to 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 21

NOTE: Oil life calculation is set at a maximum of approximately 7,500 miles (12,000 kms) or 180 days.

Without Message Center

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET IF NEW OIL.
2. Press and hold the SELECT/RESET button for about 2 seconds until the message center displays OIL LIFE SET TO 100%.
3. Once OIL LIFE SET TO 100% is displayed, press and hold the SELECT/RESET button for more than 2 seconds until the message center displays OIL LIFE SET TO XXX%.
4. Press and hold SELECT/RESET button to reduce the start value (10% for each button press).
5. Press and release SELECT/RESET button to exit the procedure.

With Message Center

1. From the setup menu, press and release RESET button to display HOLD RESET IF NEW OIL.
2. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.
3. The message center displays OIL LIFE SET TO 100%.
4. Once message center displays OIL LIFE SET TO 100%, release the RESET button then press and release the RESET button to reduce the start value (10% for each button press).

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 22

The oil life minder has 2-level warnings, both cleared by the RESET button. The critical one turns on the display after a period of time (if the condition is still active). Oil life minder warning can overwrite normal mode messages. Pressing RESET button acknowledges the warning.

1. Press the MODE button repeatedly until OIL LIFE XX% is displayed. XX will be between 6-100% when the oil life is okay. CHANGE OIL SOON is displayed if the oil life is 5% or less. CHANGE OIL NOW is displayed if the oil life is 0%.
2. Press and hold the MODE button for 5 seconds until RESET FOR NEW OIL LIFE is displayed. If the RESET button is not pressed, after one minute of inactivity or if the power is interrupted during the reset oil life mode, the message center resets the oil life to the original value. Press and release the RESET button. The oil life value will be reset to 100%.

CHANGE OIL SOON/OIL CHANGE REQUIRED MESSAGE - PROCEDURE 23

NOTE: See Fig. 2 to identify information display types.

Type 1 Information Display:

1. Press and release the SETUP button to display OIL LIFE XXX% HOLD RESET = NEW.
2. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.

   NOTE: Oil Life Start Value: The oil life start value is used to reset the oil life value back to the if the value was previously changed, or to lower the value from the maximum in 10% increments down to 10%. To change oil life value to another value, proceed to next step.

3. Once "OIL LIFE SET TO XXX%" is displayed, release and press the RESET button to change the Oil Life Start Value. Each release and press will reduce the value by 10%.

Type 2 Information Display:

The message center is used to program/configure various options. The message center display is located in the instrument cluster.

Use the left steering wheel controls to navigate through the message center to locate the Oil Life Reset option: *Main Menu > Settings > Vehicle > Oil Life Reset* .

Press the up/down arrow buttons to move up/down through the message center choices.

Press the left/right arrow buttons to move left/right through the message center choices.

- Press the left/right, up/down arrow buttons to move through the message center choices. Select SETTINGS
- Press the left/right, up/down arrow buttons to move through the message center choices. Select VEHICLE
- Press the left/right, up/down arrow buttons to move through the message center choices. Select OIL LIFE RESET
- Press the left/right, up/down arrow buttons to move through the message center choices. Select Percentage - 100, 90, 80, 70, 60, 50, 40, 30, 20, or 10.
- Press the OK button to select highlighted options and confirm choices/messages.

CHECK A/C (CABIN) FILTER MESSAGE

NOTE: To determine the appropriate reset procedure, refer to CHECK A/C (CABIN) FILTER MESSAGE RESET INDEX. Only vehicles listed in this index have a Check A/C (Cabin) Filter Message reset.

CHECK A/C (CABIN) FILTER MESSAGE RESET INDEX

Model & Year	Reset Procedure
LS	
2000-06	Check A/C (Cabin) Filter Message Reset - Procedure 1

CHECK A/C (CABIN) FILTER MESSAGE RESET - PROCEDURE 1

1. To reset the A/C filter monitoring system to 100%, press the STATUS control to access the System Check function. Message center will display A/C FILTER XXX% RESET FOR NEW.
2. Press and hold RESET control to change setting to 100%. Message center will now display IF NEW FILTER HOLD RESET.
3. If reset procedure is successful, the message center will display A/C FILTER LIFE SET TO 100%.

OVERHEAD WARNING LIGHTS

NOTE: To determine the appropriate reset procedure, refer to OVERHEAD WARNING LIGHTS RESET INDEX. Only vehicles listed in this index have an Overhead Warning Lights reset.

OVERHEAD WARNING LIGHTS RESET INDEX

Model & Year	Reset Procedure
Cougar	
1992-02	Overhead Warning Lights Reset - Procedure 1

OVERHEAD WARNING LIGHTS RESET - PROCEDURE 1

1. One or more of the 7 overhead lights will turn on after about 358 days or 4800 miles to indicate routine service should be performed.
2. To reset the light, hold the SELECT and UNITS buttons on the trip computer for 5 seconds. The service interval light will be illuminated, and then turn off after about 4 seconds.

SERVICE INTERVAL REMINDER LIGHT

NOTE: To determine the appropriate reset procedure, refer to SERVICE INTERVAL REMINDER LIGHT RESET INDEX. Only vehicles listed in this index have a Service Interval Reminder Light reset.

SERVICE INTERVAL REMINDER LIGHT RESET INDEX

Model & Year	Reset Procedure

Passenger Cars	
1985-89	**Service Interval Reminder Light Reset - Procedure 1**
Continental	
1990-94	**Service Interval Reminder Light Reset - Procedure 2**
Light Duty Trucks	
1985-87	**Service Interval Reminder Light Reset - Procedure 3**
Non-EEC Light Duty Trucks	
1988	**Service Interval Reminder Light Reset - Procedure 3**

SERVICE INTERVAL REMINDER LIGHT RESET - PROCEDURE 1

Every 5000 or 7500 miles, depending upon engine application, a SERVICE interval reminder light on the dash will illuminate (for approximately 30 seconds), or begin flashing, indicating an oil change is due.

To reset reminder light, turn ignition on. Simultaneously depress and hold TRIP (ODO SEL on Taurus and Sable, SYSTEM CHECK or CHECK OUT on Continental) and RESET or TRIP RESET buttons. On Probe, depress and hold SERVICE RESET button, located on speed alarm keyboard. On all models, 3 beeps will verify that reminder light has been reset.

SERVICE INTERVAL REMINDER LIGHT RESET - PROCEDURE 2

During system check sequence, the SERVICE symbol comes on and displays the number of miles to go before the next normal service. To reset the service interval reminder, press SYSTEM CHECK and RESET buttons simultaneously. The display should now show 7200 miles. Service interval reminder light has been reset.

SERVICE INTERVAL REMINDER LIGHT RESET - PROCEDURE 3

A SRI is used to indicate emission system maintenance is required. Control unit (timer) for maintenance light is located under dash, near steering column or behind glove box. Some models use a non-resettable control unit. Replace it with a resettable type. After servicing emission system, reset SRI.

1. To reset SRI, turn ignition off. Remove tape over reset hole in timer. Lightly push a small Phillips screwdriver into hole in timer unit marked RESET. With light pressure on screwdriver, turn ignition switch to RUN position.
2. Light should stay on while screwdriver is pressed down. Hold screwdriver down for approximately 5 seconds. Remove screwdriver. Light should go out within 2-5 seconds. If light does not go out, repeat step 1
3. Cycle ignition from OFF to RUN position. Light should glow for 2-5 seconds. This verifies proper reset of maintenance reminder light.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: **To determine the appropriate reset procedure, refer to TPMS RESET INDEX. Only vehicles listed in this index have a TPMS reset.**

(1) This is an Indirect TPM System. A transmitter activation tool is not required for this procedure.

(2) For 2010 models with Integrated Keyhead Transmitter (IKT) or Intelligent Access (IA) type of Remote Keyless Entry system, see TPMS Reset - Procedure 3 or 4

TPMS SENSOR TYPES

Ford Motor Company uses three different designs of TPMS sensor:

- Banded Sensor
- Valve Mounted Bolt-On Sensor
- Valve Mounted Snap-In Sensor

NOTE: Although the three different system use similar methods for communicating, the tire pressure sensors are not interchangeable.

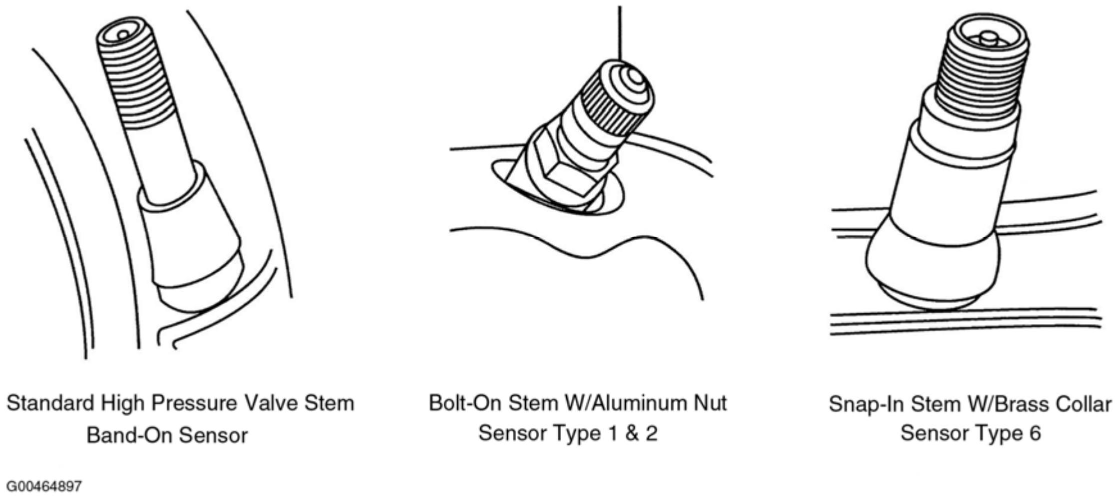

Fig. 3: Identifying Valve Stems Used With Ford TPMS Sensors

Banded Sensor

The banded (or band-on) TPMS sensor assembly consists of:

- A metal band around the center of the wheel
- A cradle or bracket to hold the sensor
- A tire pressure sensor

Valve Mounted Bolt-On Sensor

The valve mounted sensors (also known as a Schrader Valve Sensor) are one-piece "bolt-on" valve mounted sensor where the sensor and valve stem are molded together. The sensor is secured in place by a hex nut and uses a rubber grommet to prevent any leaks. This sensor was replaced by the Banded Sensor.

Valve Mounted Snap-In Sensor

Beginning in 2009 with the Escape and F-150, a two piece snap-in valve mounted sensor was used. The sensor and valve stem are separate pieces which are screwed together and can be replaced separately.

The sensor is referred to as "snap-in" because it uses a more traditional rubber valve stem for installation and does not use a hex nut fastener or rubber o-ring for attachment.

NOTE: **Snap-In Sensors MUST USE new style valve stem.**

TPMS RESET - PROCEDURE 1

NOTE: **If tire pressure sensor is replaced, it will need to be trained. The TPM system is not affected by wheel and tire rotation.**

NOTE: **As ambient temperature decreases by 6°C (10°F), tire pressure decreases 1 psi (7 kPa). Because tire pressures fluctuate with temperature changes, tire pressures must be set when tires are at outdoor ambient temperatures. If the tire pressure may drop enough to be detected by the TPM system, which will activate the low pressure warning light.**

NOTE: **When the tire pressure warning light comes on solid and message center displays "LOW TIRE PRESSURE", check the air pressure of all tires and adjust to the specified cold pressure listed on vehicle certification label (found on driver's door or door pillar). Drive the vehicle at 20 mph (32 km/h) for at least 2 minutes. If the vehicle has been stationary for more than 30 minutes, a TPM sensor Activation procedure may be needed. Make sure the warning light goes off. If the warning light stays on, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **When the tire pressure warning light flashes for 70 seconds and then remains illuminated, after bulb-check has been performed and message center displays warning messages, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the TPM system may not function properly:**

- **Low tire pressure.**
- **Tire pressure sensor is missing or damaged.**
- **Spare tire is installed as a road wheel.**
- **Incorrect tire pressure sensor is installed.**
- **Tire pressure sensor installed incorrectly.**
- **Non-OEM wheels installed (aftermarket rims).**
- **Non-OEM equipped run-flat tires installed.**
- **Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks, etc.)**

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without Radio Frequency (RF) noise and at least 3 ft. (1 m) away from any other vehicle equipped with TPM system. RF noise is generated by electrical motor and appliance operation, cellular telephones and remote transmitters, power inverters and portable entertainment equipment.

NOTE: A new tire pressure sensor is shipped in an OFF mode (or battery saver mode), and must be turned ON before it can be trained. To turn the sensor on, inflate the tire to the recommended inflation pressure and wait at least 2 minutes, then continue with the sensor training procedure.

1. Turn ignition switch to OFF position, then press and release brake pedal.
2. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
3. Press and release the brake pedal.
4. Turn ignition switch to OFF position.
5. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.

   NOTE: The horn will sound once and the tire pressure warning light will flash if train mode has been entered successfully (if equipped, the message center displays "TRAIN LF TIRE").

6. Depending on TPMS sensor type, place transmitter activation tool on the left front tire wall:
   - **Band-On Type Sensor:** Opposite (180 degrees) from the valve stem. See **Fig. 4**
   - **Valve-Mounted Type Sensor:** Near the valve stem.

   Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the Driver's Door Module (DDM).

   NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the transmitter activation tool must remain in place, in the appropriate position relative to the valve stem.

   NOTE: If a sensor does not respond to the activation tool, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

   NOTE: If the DDM does not recognize any one of the 4 tire pressure sensors during the 2 minute time limit for each sensor response, the horn will sound twice and the message center (if equipped) will display "TIRE NOT TRAINED REPEAT". The training procedure must be repeated from the beginning.

7. Within 2 minutes after the horn sounds, place transmitter activation tool on the right front tire wall, in the

appropriate position relative to the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.

NOTE: **Do not wait more than 2 minutes between training each sensor. If the wait time is more than 2 minutes the DDM will stop and the training procedure must be repeated from the beginning.**

8. When the tire training procedure is complete, the message center (if equipped) will display "TIRE TRAINING COMPLETE". For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when ignition is turned off, the training procedure was not successful.

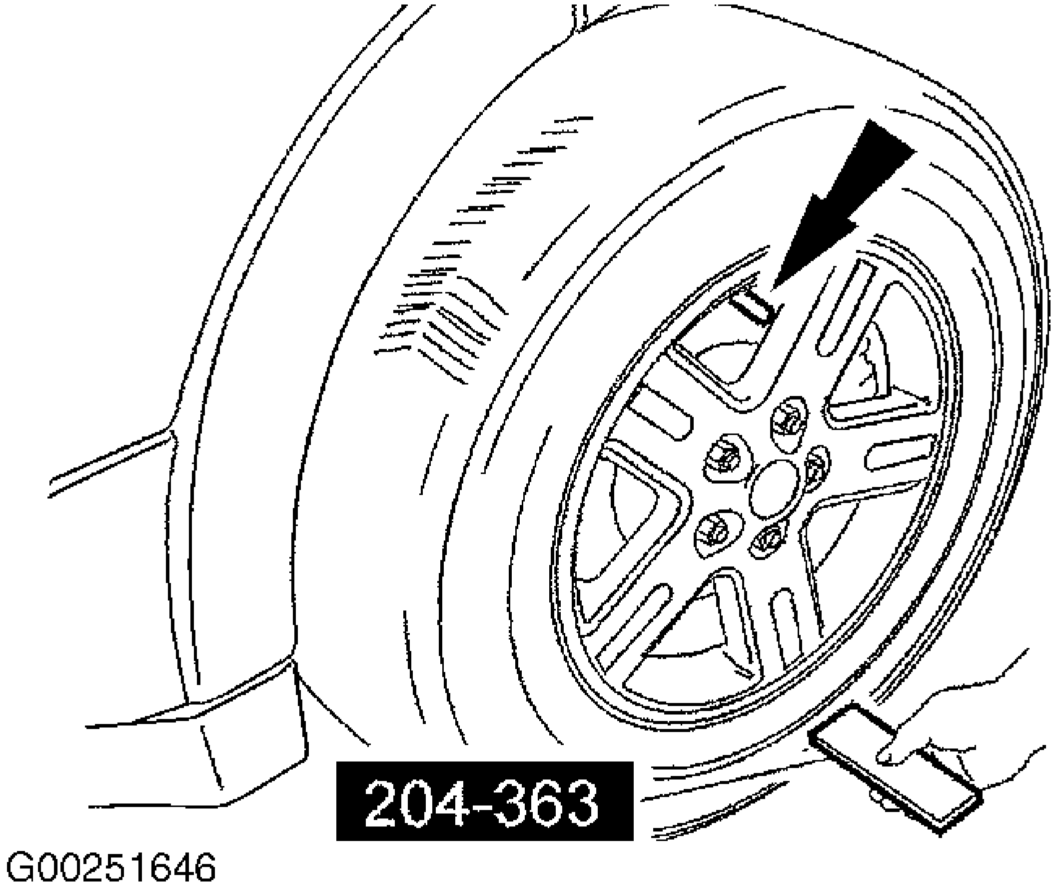

Fig. 4: Training Tire Pressure Sensors (Wheels With Band-On Sensors)
Courtesy of FORD MOTOR CO.

TPMS RESET - PROCEDURE 2

NOTE: **If vehicle is stationary overnight when outside temperature is significantly lower than daytime temperature, tire pressure may decrease about 3 psi (21 kPa) for a drop of 30°F (17°C) in ambient temperature. This pressure decrease may activate TPM warning system.**

NOTE: **Since tire pressure information is updated once every minute, it may take up to a minute for warning light to turn off after tire pressure has been adjusted. If vehicle has been parked for over 15 minutes, system information will be updated once an hour. In this case, it may take up to an hour for warning light to turn off after tire pressure has been adjusted.**

NOTE: **When the tire pressure warning light comes on solid, check the air pressure of all tires and adjust to the specified pressure listed on tire label (located on the driver's door or "B" pillar). Drive the vehicle at 20 mph (32 km/h) for at least 2 minutes. Make sure the warning light goes off. If the warning light stays on, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **When the tire pressure warning light flashes for 20-30 seconds either at start-up or while driving, check to see if a spare tire is being used. Repair as necessary. Make sure the warning light goes off. If the tires are adjusted to the appropriate pressure, spare tire is not in use, and warning light continues to flash, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

WARNING: **In the following procedure, a magnet is used. Death or serious injury can occur if magnetically sensitive devices are exposed to the relearn magnet. Magnets can affect pacemakers.**

NOTE: **The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency (RF) noise. RF noise is generated by electrical motor and appliance operation, cellular telephones and remote transmitters, power inverters and portable entertainment equipment.**

1. Turn ignition switch to OFF position.
2. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
3. Press and release the brake pedal.
4. Turn ignition switch to OFF position.
5. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle. The horn will sound once and the TPMS indicator will flash if train mode has been entered successfully (if equipped, the message center displays "TRAIN LF TIRE").
6. Place the TPM Relearn Magnet on the valve stem of the left front tire pressure sensor. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the TPMS module.
7. Within 2 minutes after the horn sounds, place the magnet on the valve stem of the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.

NOTE: **If the VSM (TPMS module is integral to VSM) does not recognize any one**

of the 4 tire pressure sensors during the tire training procedure, the horn will sound twice and the message center (if equipped) will display "TIRE NOT TRAINED REPEAT". If this occurs, procedure must be repeated.

8. When the tire training procedure is complete, the horn will sound once and the message center (if equipped) will display "TIRE TRAINING MODE COMPLETE".

TPMS RESET - PROCEDURE 3

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. **Close All Doors.**
3. Turn ignition switch to OFF position, then press and release brake pedal.
4. Using the START/STOP button, switch from OFF to ACCESSORY to RUN position 3 times, ending in RUN position.
5. Press and release the brake pedal.
6. Turn ignition switch to OFF position.
7. Using the START/STOP button, switch from OFF to ACCESSORY to RUN position 3 times, ending in RUN position.
8. Place transmitter activation tool on the left front tire wall at the valve stem. Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized.
9. Within 2 minutes after the horn sounds, place transmitter activation tool on the right front tire wall at the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.
10. When the tire training procedure is complete, the message center (if equipped) will display "TIRE TRAINING COMPLETE". For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when ignition is turned off, the training procedure was not successful.

TPMS RESET - PROCEDURE 4

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to OFF position, then press and release brake pedal.
3. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
4. Press and release the brake pedal.
5. Turn ignition switch to OFF position.
6. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle. The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.
7. Place transmitter activation tool on the left front tire wall at the valve stem. Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the DDM.

NOTE: Do not wait more than 2 minutes between training each sensor. If the wait time is more than 2 minutes the DDM will stop and the training procedure must be repeated from the beginning.

8. Within 2 minutes after the horn sounds, place transmitter activation tool on the right front tire wall at the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.
9. When the tire training procedure is complete, the message center (if equipped) will display "TIRE TRAINING COMPLETE". For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when ignition is turned off, the training procedure was not successful.

TPMS RESET - PROCEDURE 5

NOTE: After tire rotation, replacement, balancing, alignment or pressure adjustment, TPM system will need to be reset.

Vehicles With Message Center

1. To reset the system, turn ignition switch to ON position.
2. Press and hold the SETUP button and wait for the message center to display "SYSTEM CHECK".
3. Press the RESET button and wait for the message center to display "HOLD RESET TO RELEARN".
4. Continue to hold the RESET button for 3 seconds. The message "HOLD RESET TO RELEARN" and the low tire warning light will flash 3 times, indicating the reset procedure is complete.
5. If the light illuminates, reset the tire pressure to specification, then repeat procedure from step 1.
6. The system normally requires 15-20 minutes of driving in each of 3 speed ranges to learn how the tires behave after the system has been reset. However, the system will become functional in each speed range as soon as learning completes in each individual speed range.

TIRE LEARNING SPEED RANGES

Speed Range	MPH (KM/H)
Low	25-42 (40-68)
Medium	42-62 (68-100)
High	Above 62 (100)

Vehicles Without Message Center

1. To reset the system, turn ignition switch to ON position.
2. Press and hold the Trip/Odometer reset button, and wait until "TIRE RESET" or "CHECK TIRE AND RESET" is displayed in odometer display window.
3. Continue to press the button for 3 seconds, then release. After 3 seconds, the low tire pressure warning light will flash 3 times, indicating that the low tire warning system reset procedure is complete.

TPMS RESET - PROCEDURE 6

1. Drive the vehicle above 20 mph (32 km/h) for at least two minutes and then park in a location where you can easily get to all four tires and have access to an air pump.
2. Turn the ignition ON, with the engine OFF.
3. Turn the hazard flashers on then off three times. This must be accomplished within 10 seconds. If the reset mode has been entered successfully, the horn will sound once, the system indicator will flash and the message center (if equipped) will display TRAIN LEFT FRONT TIRE. If this does not occur, please try again starting at Step 2.
4. Place a transmitter activation tool on the left front tire wall at the valve stem. Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized.
5. Within 2 minutes after the horn sounds, place activation tool on the right front tire wall at the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.
6. After all four tires have been trained, remove the valve cap from the valve stem on the left front tire; decrease the air pressure until the horn sounds. The single horn chirp confirms that the sensor identification code has been learned by the module for this position. If a double horn is heard, the reset procedure was unsuccessful, and must be repeated.
7. Repeat the air pressure decrease procedure for the remaining three tires.
8. Training is complete after the horn sounds for the last tire trained (driver's side rear tire), the system indicator stops flashing, and the message center (if equipped) displays TRAINING COMPLETE.
9. Turn the ignition off. If two short horn beeps are heard, the reset procedure was unsuccessful and must be repeated.
10. Set all four tires to the recommended air pressure as indicated on the Safety Compliance Certification Label or Tire Label.
11.

VEHICLE MAINTENANCE MONITOR (VMM)

NOTE: **To determine the appropriate reset procedure, refer to VEHICLE MAINTENANCE MONITOR RESET INDEX. Only vehicles listed in this index have a Vehicle Maintenance Monitor reset.**

VEHICLE MAINTENANCE MONITOR RESET INDEX

Model & Year	Reset Procedure
Cougar	
1989-92	**Vehicle Maintenance Monitor Reset - Procedure 1**
Probe	
1990-92 (With Standard Instrument Cluster)	**Vehicle Maintenance Monitor Reset - Procedure 1**
1990-92 (With Electronic Instrument Cluster)	**Vehicle Maintenance Monitor Reset - Procedure 2**
Thunderbird	

1989-92	**Vehicle Maintenance Monitor Reset - Procedure 3**

VEHICLE MAINTENANCE MONITOR RESET - PROCEDURE 1

NOTE: For models with Standard Instrument Cluster.

1. The SERVICE light will come on approximately every 7500 miles, indicating routine service is required. The light will remain on for 3 minutes after vehicle is started.
2. To cancel the message and reset SERVICE light on 1990 models, depress and hold SERVICE RESET button until 3 beeps are sounded. This will verify that reminder light has been reset. SERVICE RESET button is located in VMM unit, in center of overhead console.
3. To cancel the message and reset SERVICE light on 1991-92 models, insert a small diameter shank into hole centered directly above VMM display lights, and press switch once.

VEHICLE MAINTENANCE MONITOR RESET - PROCEDURE 2

NOTE: For models with Electronic Instrument Cluster.

1. SERVICE INTERVAL will be displayed on system scanner every 7500 miles, indicating that routine service is due. At 7500 miles, the message will remain on for 3 minutes after vehicle is started.
2. To cancel message and reset service interval on 1990 models, press and hold ODO SEL and TRIP RESET buttons until 3 beeps are heard. Buttons are located on speed alarm keyboard.
3. To cancel message and reset service interval on 1991-92 models, press and hold SERV button until 3 tones are heard. SERV button is located on speed alarm keyboard.

VEHICLE MAINTENANCE MONITOR RESET - PROCEDURE 3

1. Turn ignition switch to ON position. Within 16 seconds of turning ignition on, insert small diameter shank into reset switch hole, and firmly push in switch. Reset switch hole is located on left side of VMM panel.
2. Keep switch depressed until left side of display stops flashing. If switch is not kept depressed until left side of display stops flashing, VMM will not be reset.

2008 MAINTENANCE INFORMATION

Maintenance Schedule - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

MAINTENANCE SCHEDULES - GASOLINE ENGINES

The maintenance schedule is designed to protect against major repairs resulting from neglect or inadequate maintenance and to prolong the life of the vehicle.

General Maintenance Information

NOTE: This is a generic maintenance schedule for all Ford, Lincoln and Mercury vehicles. There may be items listed that do not apply to all vehicles.

The Normal Schedule applies to operation of the vehicle under typical, everyday driving conditions. The maintenance frequency in this schedule typifies what the vast majority of vehicles will require. The listed services should be carried out at specified mileage, time or hours of operation, whichever occurs first. There are, however, additional services required that only the noted vehicles require.

If the vehicle is operated in one or more of the following special operating conditions, those additional services will be required. The special operating conditions are:

- Towing a trailer or using a camper or car-top carrier
- Extensive idling and/or low-speed driving for long distances as in heavy commercial use such as delivery, taxi, patrol car or livery
- Driving in dusty conditions such as unpaved or dusty roads
- Off-road operation
- Use of E85 fuel 50% of the time or greater (flex fuel vehicles only)

There are also exceptions to the Normal Schedule which will require more frequent maintenance for some components. Those exceptions are:

- Vehicle axle - maintenance and lubrication
- Police and taxi vehicles - maintenance and lubrication
- Engine oil and Motorcraft Premium Gold Coolant - time-based and mileage-based intervals
- Change brake fluid every 2 years (Class A Motorhome)

Special Operating Condition Requirements

When towing a trailer or using a camper or car-top carrier:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise

every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

- Change automatic transmission/transaxle fluid (not required on 6R60/6R75/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Replace wheel bearing grease and install new grease seals on rear wheel drive (RWD) front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change transfer case fluid every 96,000 km (60,000 mi).
- Change manual transmission fluid as required.
- Inspect and lubricate U-joints and halfshafts as required.

During extensive idling and/or low speed driving for long distances, as in heavy commercial use such as delivery, taxi, patrol car or livery:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months or 200 hours of engine operation.
- Lube front lower control arm and steering linkage ball joints with zerk fittings (if equipped) every 8,000 km (5,000 mi).
- Inspect brake system every 8,000 km (5,000 mi).
- Inspect and lubricate U-joints (if equipped) every 8,000 km (5,000 mi).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Lubricate control arm and steering ball joints (if equipped).
- Install a new fuel filter every 24,000 km (15,000 mi) (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change automatic transmission fluid (not required on 6R60/6R75/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Install new spark plugs every 96,000 km (60,000 mi).
- Change transfer case fluid every 96,000 km (60,000 mi).
- Install a new cabin air filter as required (if equipped).

When operating in dusty conditions such as unpaved or dusty roads:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect and lubricate U-joints (if equipped) every 8,000 km (5,000 mi).

- Install a new fuel filter every 24,000 km (15,000 mi) (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).
- Change automatic transmission fluid (not required on 6R60/6R75/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change rear axle lubricant every 80,000 km (50,000 mi) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 mi).
- Install a new engine air filter as required.
- Install a new cabin air filter as required (if equipped).

When operating in off-road conditions:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change automatic transmission fluid (not required on 6R60/6R75/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Change rear axle lubricant every 80,000 km (50,000 mi) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 mi).
- Install a new cabin air filter as required (if equipped).
- Inspect and lubricate U-joints and halfshafts as required.
- Inspect and lubricate steering linkage ball joints with zerk fittings as required.

Use of E85 fuel 50% of the time or greater (flex fuel vehicles only):

- Fill fuel tank with a full tank of regular unleaded fuel every 4,800 km (3,000 mi).
- Change engine oil and install a new oil filter every 8,000 km (5,000 mi), 6 months or 200 hours of engine operation.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

Checks and Services

Certain basic maintenance checks and inspections should be carried out at specified intervals. Any recognized adverse condition should be corrected as soon as possible.

Multi-Point Inspection

The following inspections are recommended at every service interval:

- Check and top off brake, coolant, manual and automatic transmission (if equipped with a underhood fluid level indicator), power steering and window washer fluids.
- Inspect tires for wear and correct air pressure, including spare tire.
- Check exhaust system for leaks, damage, loose parts and foreign material.
- Check battery performance.
- Check operation of horn, exterior lamps, turn signals and hazard warning lights.
- Check radiator, coolers, heater and air conditioning hoses.
- Inspect windshield wiper spray and wiper operation.
- Check windshield for cracks, chips and pitting.
- Inspect for oil and fluid leaks.
- Inspect engine air filter.
- Inspect halfshaft dust boots (if equipped).
- Check shocks, struts and other suspension components for leaks and damage.
- Inspect steering and linkage.
- Inspect accessory drive belt(s).
- Inspect clutch operation (if equipped).

In-Line, Service-Installed Transmission Fluid Filter

Some vehicles may be equipped with an inline, service-installed transmission fluid filter. This filter is installed in the transmission fluid cooler return line. If equipped, install a new inline filter during transmission fluid change intervals.

Maximum Oil Change Interval (Normal Schedule)

- 12,000 km (7,500 mi) or 6 months.

Maximum Oil Change Interval (Special Operating Conditions)

- 8,000 km (5,000 mi), 6 months or 200 hours of engine operation.

Engine Coolant Change Interval

- 6 years or 169,000 km (105,000 mi).
- After initial change: 3 years or 73,000 km (45,000 mi).

Monthly Checks

Check each of the following items every month:

- All interior and exterior lights for correct operation
- Tires for wear and correct air pressure, including spare tire
- Engine oil fluid level
- Windshield washer solvent fluid level

Six Month Checks

Check each of the following items at least every 6 months:

- Lap/shoulder belts and seat latches for wear and function
- External mounted spare tire is stowed correctly (tight to body)
- Power steering fluid level
- Washer spray, wiper operation and clean all wiper blades (install new wiper blades as necessary)
- Parking brake for correct operation
- Lubricate all hinges, latches, door check straps and outside locks
- Lubricate upper and lower sliding door tracks (if equipped)
- Clean sliding door contact switches (if equipped)
- Lubricate door rubber weatherstrips
- Clean body and door drain holes
- Safety warning lamps (brake, ABS, air bag, safety belt) for correct operation
- Coolant system fluid level and correct strength
- Battery connections. Clean if necessary
- Clutch fluid level, if equipped

Normal Schedule

The following check procedures should be carried out for all cars, minivan, light trucks, sport utilities, vans and four wheel drive (4WD) vehicles.

- Retighten the wheel nuts to the specified torque at 800 km (500 mi) after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).
- On vehicles equipped with dual rear wheels, retighten the wheel nuts to the specified torque at 160 km (100 mi) and again at 800 km (500 mi) of new vehicle operation or after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).

12,000 Km (7,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

24,000 Km (15,000 Mi)

- Change engine oil and install a new oil filter.
- Install a new cabin air filter (if equipped).
- Inspect steering linkage, suspension and if equipped, driveshaft and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect engine air filter.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

36,000 Km (22,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

48,000 Km (30,000 Mi)

- Change engine oil and install a new oil filter.
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift® transmission and externally mounted remote filter.
- Install a new remote filter if equipped with a TorqShift® transmission.
- Inspect automatic transmission/transaxle fluid level using the fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Install a new cabin air filter (if equipped).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new engine air filter (except Focus with partial zero emission vehicle [PZEV] engine).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.

- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect and lubricate ball joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

60,000 Km (37,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

72,000 Km (45,000 Mi)

- Change engine oil and install a new oil filter.
- Install a new cabin air filter (if equipped).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect engine air filter.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

84,000 Km (52,500 Mi)

- Change engine oil and install a new oil filter.

- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

96,000 Km (60,000 Mi)

- Change engine oil and install a new oil filter.
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift® and 4F27E transmissions.
- Install a new externally mounted remote filter element for all TorqShift® transmissions (if equipped).
- Install a new internal TorqShift® transmission fluid filter located inside the transmission bottom pan (vehicles without externally mounted remote filter only).
- Inspect automatic transmission/transaxle fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Install a new cabin air filter (if equipped).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new engine air filter.
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

108,000 Km (67,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be

done.

120,000 Km (75,000 Mi)

- Change engine oil and install a new oil filter.
- Install a new cabin air filter (if equipped).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect engine air filter.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

132,000 Km (82,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

144,000 Km (90,000 Mi)

- Change engine oil and install a new oil filter.
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift® transmission and externally mounted remote filter.
- Install a new remote filter if equipped with a TorqShift® transmission.
- Inspect automatic transmission/transaxle fluid level using the fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Install a new cabin air filter (if equipped).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).

- Install new spark plugs.
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect drive belts.
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

156,000 Km (97,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

168,000 Km (105,000 Mi)

- Change engine oil and install a new oil filter.
- Install a new cabin air filter (if equipped).
- Install a PCV valve on all cars and light trucks under 6,000 lb GVW (except 3V engines).
- Change rear axle fluid on vehicles equipped with DANA axles which use synthetic lubricants.
- Change premium gold engine coolant.
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine coolant system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect engine air filter.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).

- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

180,000 Km (112,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

192,000 Km (120,000 Mi)

- Change engine oil and install a new oil filter.
- Install a new cabin air filter (if equipped).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).
- Install a new PCV valve on all cars and light trucks over 6,000 lb GVW (except 3V engines).
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift® and 4F27E transmissions.
- Install a new externally mounted remote filter element for all TorqShift® transmissions (if equipped).
- Install a new internal TorqShift® transmission fluid filter located inside the transmission bottom pan (vehicles without externally mounted remote filter only).
- Inspect automatic transmission/transaxle fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect drive belts.
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different

front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

204,000 Km (127,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

216,000 Km (135,000 Mi)

- Change engine oil and install a new oil filter.
- Install a new cabin air filter (if equipped).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect engine air filter.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

228,000 Km (142,500 Mi)

- Change engine oil and install a new oil filter.
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

240,000 Km (150,000 Mi)

- Change engine oil and install a new oil filter.
- Change premium gold engine coolant.

- Install a new cabin air filter (if equipped).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus and Sable).
- Change automatic transmission/transaxle fluid and filter on all vehicles except 4F27E, TorqShift® without external filter (filter not required on CD4E, 6F50, AWF-21 and FNR5).
- Install a new remote filter if equipped with a TorqShift® transmission.
- Change transfer case fluid (if equipped).
- Install new front wheel bearings (if not sealed units).
- Install a new drive belt(s) (if a new belt has not been installed within the last 160,000 km [100,000 mi]).
- Inspect steering linkage, suspension and, if equipped, driveshaft, ball joints and U-joints.
- Inspect engine cooling system and hoses.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect halfshaft boots (if equipped).
- Inspect exhaust system and heat shields.
- Inspect PVC for flow (3V engines).
- Inspect and lubricate ball joints and U-joints (if equipped with zerk fittings).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Carry out multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

Exceptions To Normal Schedule

Maximum Oil Change Interval

- Normal schedule: 12,000 km (7,500 mi) or 6 months, whichever occurs first.
- Special operating conditions: 8,000 km (5,000 mi), 6 months or 200 hours of operation, whichever occurs first.

Motorcraft Premium Gold Coolant

- Change premium gold engine coolant at 6 years or 168,000 km (105,000 mi) of the vehicle's life, whichever occurs first.
- After the initial change, change coolant every 3 years or 72,000 km (45,000 mi) thereafter.

Normal Vehicle Axle Maintenance

Rear axles and transfer case/power transfer unit (PTU) units containing synthetic lubricant and light duty trucks equipped with Ford-design axles are lubricated for life. These lubricants are not to be checked or changed unless service is required, or if a leak is suspected or the axle assembly has been submerged in water.

The axle and transfer case/PTU fluid should be changed anytime they have been submerged in water. Non-synthetic rear axle lubricants should be installed new every 4,800 km (3,000 mi) or 3 months, whichever occurs first, during extended trailer tow operation above 21°C (70°F) ambient and wide open throttle (WOT) for extended periods above 72 km/h (45 mph).

The 3,000 mile lube change interval may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 4 ounces of additive friction modifier for complete refill of Traction-Lok® rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

Police and Taxi Vehicle Axle Maintenance

Install new rear axle lubricant every 160,000 km (100,000 mi). Rear axle lubricant change may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 4 ounces of additive friction modifier for complete refill of Traction-Lok® rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

Class A Motorhome

- Every 2 years - change brake fluid.

DESCRIPTION AND OPERATION

MANUAL TRANSAXLE AND CLUTCH

The transaxle and clutch system consist of the following:

- Five-speed manual transaxle

- Clutch disc
- Clutch pressure plate
- Clutch release hub and bearing
- Clutch hydraulic system
- Clutch pedal
- Flywheel

The transaxles function is to move the vehicle from a rest position to motion. The transaxle uses gears to adapt the torque to the demands of load and road conditions. It matches engine power to vehicle needs. This power is delivered from the engine's flywheel to the transaxle. The power is transmitted through a driver-operated clutch, which allows for engagement and disengagement of the engine to the transaxle.

The transaxle input shaft receives the power when the clutch is engaged. The transaxle then uses a system of gears to change the speed and torque relationship between the engine crankshaft and the transaxle differential.

The purpose of the clutch is to connect and disconnect a manually operated transaxle, and the halfshafts, from the engine. This allows starting and stopping the vehicle, shifting and changing speeds that correspond to the engine speed through gear changes.

The manual transmission has a tag to identify assemblies for repair purposes. Refer to **MANUAL TRANSAXLE/TRANSMISSION** article for the transmission tag information.

DIAGNOSTIC TESTS

MANUAL TRANSAXLE AND CLUTCH

Principles of Operation

The clutch master cylinder transmits fluid pressure to the clutch slave cylinder, which in turn moves the clutch release hub and bearing. The clutch hydraulic system uses brake fluid and has a separate reservoir. The clutch is a single-plate, dry-friction disc with a diaphragm-style spring pressure plate. The clutch disc has frictional material where it contacts the flywheel and the clutch pressure plate. The clutch pressure plate applies pressure to the clutch disc, holding it tightly against the surface of the flywheel.

In the engaged position, the clutch pressure plate diaphragm spring holds the clutch pressure plate against the clutch disc, so that the engine torque is transmitted to the input shaft. When the clutch is depressed, movement is transmitted through the clutch hydraulic system.

Inspection and Verification

CAUTION: If transaxle noise is reported, first check the fluid level. The vehicle should not be driven if the fluid level is low or damage can occur.

NOTE: Before attempting to rectify any concerns, road test the vehicle to ascertain in which system the concern falls.

NOTE: If any evaluation or inspection reveals an obvious concern, repair the vehicle.

The technician should have a thorough knowledge of transaxle/clutch operation and accepted general transaxle/clutch guidelines to detect any problems.

A gear driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Certain conditions, such as road and weather, will amplify normal vehicle noise.

The following overview is a guide to diagnose a transaxle/clutch concern:

- Verify and document the customer concern.
  - During the customer interview, if a leak was noticed or if a leak is the concern, check the transmission fluid. The vehicle should not be driven if the fluid level is low.
- Check fluid level and condition.
- Evaluation of the clutch hydraulic system.
- Evaluation of the clutch.
- Inspect gearshift mechanism.
- Road test.
- Find the cause of the problem and correct it.

Verify Customer Concern

1. Verify and document the customer concern.
   1. When was it first noticed?
   2. Did it appear suddenly or gradually?
   3. Did anything unusual occur that would coincide with it or precede it?
   4. Identify when the condition occurs:
      - Hot or cold vehicle operating conditions
      - Type of terrain
      - City/highway driving
      - Driving at a particular speed
        - coasting
        - hard acceleration
      - Shifting
        - upshifts
        - downshifts
        - in a particular gear
        - in all gears
      - Hot or cold ambient temperatures
   5. Has the transaxle/clutch been repaired before or components installed?

- Check the vehicle service record. Note any repairs.

Check Fluid Level and Condition

NOTE: The vehicle should not be driven if the fluid level is low.

An incorrect level may affect the transaxle operation and can result in transaxle damage. To correctly check and add fluid to the transaxle, refer to transaxle draining and filling in **MANUAL TRANSAXLE/TRANSMISSION** article.

A low fluid level can result in poor transaxle shifting, engagement or damage. It can also indicate a leak in one of the transaxle seals or gaskets.

1. Check the fluid condition.
    - Observe the color and the odor of the fluid. Allow the fluid to drip onto a white cloth and examine the stain. Check the fluid for contamination or metal particles.
        - Fluid should appear nearly clear, similar to clean engine oil.

Evaluation of Clutch Hydraulic System

1. Verify that the brake/clutch hydraulic fluid reservoir is filled to the correct level.
    - If the fluid level is correct, proceed to clutch check.
    - If the rear chamber fluid level is low, add fluid as necessary. Check the clutch hydraulic system for leaks and repair as necessary.

Evaluation of the Clutch

1. Depress and release the clutch pedal slowly to check if the pedal is binding. Make sure the clutch pedal can be fully depressed and is not restricted by the floor mat. Verify that the pedal return spring is present and functions correctly.
2. Measure the clutch reserve. Go to **Pinpoint Test A**.
3. With the engine idling, the parking brake on and the clutch pedal up, gently move the gearshift lever toward reverse gear until gear clash can be heard. Depress the clutch pedal slowly.
    - If the gears cease to clash (full disengage at 1 to 38.1 mm (1.5 in) from the floor), then hold the pedal at the point of disengagement and increase engine to 4,000 RPM. The clutch should remain disengaged, clutch OK.
    - Any concerns indicate a worn or damaged clutch. Repair as necessary.
4. With the engine idling, move the gearshift lever into 4th gear. Increase the RPM to 2,000 and slowly release the clutch pedal.
    - If the engine stalls, the clutch is OK.
    - If the engine does not stall, the clutch is slipping. Repair as necessary.
5. Compare the clutch evaluation results with the following table. The following list of conditions are typical faults into which clutch concerns will fall.

SYMPTOM CHART - CLUTCH

Conditions/Sources	Action
• **Clutch Slippage** ○ Clutch pedal reserve ○ Diaphragm springs ○ Clutch pressure plate ○ Clutch disc facing ○ Hardened or oiled clutch disc facing surface ○ Flywheel	Go to **Pinpoint Test A**.
• **Clutch Chatter, Rattle or Shudder** ○ Engine mounts ○ Oil on clutch disc facing ○ Diaphragm springs ○ Clutch pressure plate ○ Clutch disc facing ○ Flywheel ○ Clutch disc	Go to **Pinpoint Test B**.
• **Clutch Drag** ○ Insufficient clutch fluid ○ Air in hydraulic system ○ Clutch pedal reserve ○ Diaphragm springs ○ Clutch disc ○ Clutch disc splines ○ Oil on facing	Go to **Pinpoint Test C**.
• **Clutch Pedal Pulsation** ○ Clutch and brake pedal pivot shaft not correctly lubricated ○ Flywheel ○ Worn springs in pressure plate	Go to **Pinpoint Test D**.
• **Clutch Related Vibrations** ○ Engine component grounding against frame ○ Accessory drive belt ○ Flywheel bolts ○ Flywheel ○ Imbalance clutch pressure plate	Go to **Pinpoint Test E**.
• **Hard Shifting** ○ Insufficient clutch fluid	Go to **Pinpoint Test F**.

◦ Clutch pedal reserve ◦ Transaxle concern	
• **Excessive Noise** ◦ Clutch pedal reserve ◦ Clutch slave cylinder ◦ Pilot bearing ◦ Excessive crankshaft end play	Go to **Pinpoint Test G**.
• **Clutch System Leakage** ◦ Clutch master cylinder ◦ Clutch slave cylinder ◦ Clutch hydraulic tubes	Go to **Pinpoint Test H**.
If the clutch was the concern, REPAIR the clutch system. TEST the system for normal operation.	

Inspect the Gearshift Mechanism

1. Inspect the cables for:
    - signs of damage.
    - broken locks.
    - binding.
    - cables not fully seated or in hold-down brackets.
    - hold-down bracket nuts are loose.
    - correct routing.
    - correct adjustment.
        - If the concern is a gear(s) cannot be selected, adjust the cables. Refer to **Gearshift Cable Adjustment**.
2. Inspect the gearshift for:
    - free play in the gearshift lever (must be no more than 5 mm). This specification is for an absolute or "no load" free play.
        - If the gearshift lever free play is too great, check the gearshift cables and repair as necessary.
        - If the gearshift lever free play is OK, adjust the gearshift linkage.

Evaluation of the Transmission

1. During the road test, use the following driving methods to diagnose the problem.
    - Start the engine.
    - Evaluate the noise in NEUTRAL while the vehicle is parked.
        - Check whether the noise is present with the clutch fully disengaged (pedal fully depressed). Check to see if the pedal pulsates abnormally (for clutch diaphragm finger run out).
        - Check whether the noise is present with the gearshift in the NEUTRAL position and the clutch fully engaged (foot off pedal). With the parking brake engaged, move the gearshift

towards the 1st gear position. Apply very slight pressure and note if the gear noise level is reduced. (for gear rollover noise).

- With the clutch fully engaged (foot off pedal), check whether the noise is present as the engine speed is raised. If the noise reduces, note the engine speed at which this occurs.
- Listen for any change in noise while depressing and releasing the clutch pedal.
- Listen for any change in noise while changing the engine RPM.
- Drive the vehicle and shift through all of the gear ranges, including reverse. Listen for any change in noise in a particular gear.
- Drive the vehicle in the gear in which the noise is most noticeable. Depress the clutch pedal and leave the gear engaged. Listen for any change in noise.
- Drive the vehicle in the gear in which the noise is most noticeable. Depress the clutch pedal and shift the transmission into NEUTRAL. Release the clutch pedal and allow the vehicle to coast.

2. Compare the road test results with the following symptom chart. It is a list of conditions that are typical faults into which the transaxle will fall:

   Go to **Symptom Chart - Transaxle** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Transaxle

Symptom Chart - Transaxle

Condition	Possible Sources	Action
• Noisy in forward gears - While verifying the condition, determine whether the noise is a gear roll over noise, release bearing rub or some other transmission-related noise. Gear roll over noise, inherent in manual transmissions, is caused by the constant mesh gears turning at the engine idle speed while the clutch is engaged and the transmission is in NEUTRAL. Gear roll over noise will	• Lubricant	• ADD specified lubricant as necessary.

disappear when the clutch is disengaged or when the transmission is engaged in gear. Release bearing rub is sometimes mistaken for mainshaft bearing noise. Release bearing rub will disappear when the clutch is engaged. In the event that a bearing is damaged, the noise is more pronounced while engaged in gear under load or coast than in NEUTRAL		
	• Components grounding out on the transaxle • Component housing bolts • Bearings or gears	• CHECK for screws, bolts or other components grounding out. CORRECT as required. • CHECK the torque on the transaxle-to-clutch housing bolts and the clutch housing-to-engine block bolts. TIGHTEN the bolts to specification. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article. • INSPECT the bearings. INSPECT the gears and gear teeth for wear or damage. INSTALL new components as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Gears clash when shifting from one forward gear to another	• Clutch not fully releasing • Transaxle input shaft pilot bearing worn/damaged • Gear teeth and/or synchronizer	• INSPECT clutch release mechanism for correct operation. CHECK the clutch pedal freeplay. REFER to **Clutch Pedal Freeplay Adjustment**. • INSPECT the transaxle input shaft pilot bearing for wear and damage. REPAIR as necessary. • REPAIR or INSTALL new components as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.

	• Engine idle speed too high	• REFER to the **Introduction - Gasoline Engines** article.
• Transaxle jumps out of gear	• Excessive gearshift lever boot tension	• INSTALL a new gearshift lever boot and knob assembly. REFER to **MANUAL TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
	• Transaxle-to-engine mounting bolts	• TIGHTEN the transaxle-to-engine block bolts to specification. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Internal components	• INSPECT the synchronizer sleeves for free movement on their hubs. INSPECT the synchronizer blocking rings for widened index slots, rounded clutch teeth and a smooth internal surface. CHECK the countershaft cluster gear for excessive end play. CHECK the shift forks for worn or loose mounting on the shift rails. INSPECT the synchronizer sliding sleeve and the gear clutch teeth for wear or damage. REPAIR or INSTALL new components as necessary.
	• Gear teeth worn or damaged	• INSTALL new gears. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle will not shift into one gear - all others OK	• Manual shifting components	• REPAIR or INSTALL new components as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
	• Reversing lamp switch ball	• If REVERSE is the problem, CHECK the reversing lamp switch for the ball frozen in the extended position.
	• Internal components	• INSPECT the shift rail and fork system, the synchronizer system and the gear clutch teeth for restricted travel. REPAIR or INSTALL new components as necessary.
• Transaxle is locked in one gear and cannot be shifted out of that gear	• Internal components	• INSPECT the problem gears, the shift rails, the forks and the synchronizer for wear or damage. REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Fork on rail	• CHECK the shift rail interlock system. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle leaks	• Lubricant	• CHECK the fluid level and type.
		• IDENTIFY the leaking fluid as engine, power

	• Other components leaking	steering or transaxle fluid. REPAIR as required. REMOVE all traces of fluid on exposed transaxle surfaces. CHECK the vent for free breathing. OPERATE the transaxle and INSPECT for new leakage. REPAIR as necessary.
	• Internal components	• INSPECT for leaks at the input shaft bearing retainer seal and the shift rail expansion plug. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article. INSPECT for leaks at the transaxle case-to-clutch housing seam. INSPECT the case for sand holes or cracks. REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Fill and drain plugs	• CHECK the fill plug, the drain plug and the bore threads. REPAIR as necessary. TIGHTEN to specification. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Transaxle case bolt	• CHECK for loose or missing bolts. REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Halfshaft oil seals	• CHECK for cracked, loose or damaged RH intermediate shaft oil seal or LH halfshaft oil seal. INSTALL new seals as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Bearing failure	• Other part failure • Raceways or rollers • Lubricant	• REMOVE, CLEAN and DISASSEMBLE the transaxle, then INSTALL new bearings as necessary. (It is necessary to RESET the bearing preload if any tapered bearings are installed.) REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Vibration break up of retainer and brinelling of races • Bearing(s) • Shafts or bore • Overloading of vehicle • Incorrect preload	• DETERMINE and CORRECT the cause of the vibration. • INSTALL new components and verify correct oil dam installation. REFER to

	• Input shaft oil dam	**MANUAL TRANSAXLE/TRANSMISSION** article. CHECK for correct installation of the snap ring on the mainshaft next to the oil dam.
	• Oil baffle in the input bearing shim pack	• INSTALL new components. MAKE SURE the oil baffle is not damaged during reassembly. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Excessive noise	• Clutch disc damper damaged • Transaxle input shaft pilot bearing worn or damaged • Crankshaft end play excessive • Release bearing worn or damaged	• REMOVE the clutch disc and pressure plate. REFER to **CLUTCH** article. INSPECT the clutch disc for damage. INSPECT the transaxle input shaft and the transaxle input shaft pilot bearing for wear and damage. CHECK the crankshaft end play. Refer to the appropriate Engine article for the procedure. CHECK the clutch release hub and bearing, and guide tube for wear and damage. REPAIR all components as necessary. TEST the system for normal operation.
• Clutch rattling noise - occurs with clutch engaged, noise changes/disappears with clutch pedal depressed	• Flywheel bolts, clutch housing bolts or clutch pressure plate bolts loose	• TIGHTEN the bolts to specifications. CHECK the bolts for damage. REFER to **CLUTCH** article.
• Clutch squeaking noise - noise is heard when the clutch is operated. Vehicle		

moves slowly or creeps when the clutch is disengaged. Can also be difficult to shift into 1st and REVERSE gears	• Pilot bearing seized or damaged	• INSTALL a new pilot bearing. REFER to **CLUTCH** article.
• Clutch squeaking noise - occurs with clutch pedal depressed/released	• Worn clutch pedal shaft or bushings	• INSPECT the clutch pedal for wear or damage. REPAIR as necessary. REFER to **CLUTCH CONTROLS** article.
• Clutch whirring/rattle noise - occurs when clutch pedal is depressed	• Worn, damaged or misaligned clutch release bearing	• INSTALL a new clutch release bearing. REFER to **CLUTCH** article.
• Clutch grating/grinding noise - occurs when clutch pedal is depressed	• Clutch pressure plate fingers bent or worn	• INSPECT the clutch pressure plate release fingers. INSTALL a new pressure plate as necessary. REFER to **CLUTCH** article.
	• Contact surface of clutch release bearing worn or damaged	• INSTALL a new clutch release bearing. REFER to **CLUTCH** article.
• Clutch chatter - a small amount of noise when clutch pedal is released at initial take off	• Clutch engagement	• Acceptable operating condition.
• Clutch chatter/grabs - in some cases a shudder is felt. Occurs with clutch pedal depressed/released	• Damaged or worn powertrain/driveline mounts	• INSPECT the powertrain/drivetrain mounts. INSTALL new mounts as necessary. Refer to the appropriate Engine article for the procedure.
	• Binding or dragging plunger of the clutch master cylinder or slave cylinder	• CHECK the master and slave cylinder operation. INSPECT the components for damage or wear. INSTALL a new master or slave cylinder as necessary. REFER to **CLUTCH CONTROLS** article.
	• Grease or oil on the clutch disc facing	• CHECK the input shaft seal and rear main oil seal. REPAIR as necessary. INSTALL a new clutch disc. REFER to **CLUTCH** article.
	• Clutch disc surface	• INSPECT the clutch disc surface for a glazed, hardened or damage condition.

	glazed or damaged	CARRY OUT a disc check. INSTALL a new clutch disc as necessary. REFER to **CLUTCH** article.
	• Damaged or worn clutch pressure plate	• INSPECT the clutch pressure plate for wear or damage. INSTALL a new clutch pressure plate as necessary. REFER to **CLUTCH** article.
	• Flywheel surface damaged or glazed	• INSPECT the flywheel for damage or wear. CARRY OUT a flywheel runout check. INSTALL a new flywheel as necessary. Refer to the appropriate Engine article for the procedure.
• Clutch chatter noise - noise when clutch pedal is released at initial take off. Clutch is hard to engage and disengage	• Pilot bearing worn, damaged or not correctly aligned in bore	• INSPECT the clutch pressure plate release fingers for uneven wear, clutch components burnt or a seized pilot bearing. INSTALL a new pilot bearing as necessary. REFER to **CLUTCH** article.
• Transaxle rattling/clattering noise - occurs in NEUTRAL or in gear, at idle	• Incorrect fluid level or fluid quality	• CHECK that the transaxle is filled to the correct level and with the specified fluid. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article for the fluid type.
• Transaxle rattling/clattering noise - noise at idle in NEUTRAL	• Worn or rough reverse idler gear	• CHECK the reverse idler gear. REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Excessive backlash in gears	• CHECK the gear backlash. ADJUST as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Worn countershaft gears	• REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle whine - a mild whine at extreme speeds or high RPM	• Rotating gears/geartrain	• Acceptable noise.
• Transaxle whine - a high pitched whine, also described as a squeal	• Transaxle gears are worn (high mileage vehicle)	• Result of normal gear wear. REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
		• INSPECT the gear sets for an uneven

	• Mismatched gear sets	wear pattern on the face of the gear teeth. REPAIR as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
	• Damaged or worn transaxle bearing	• INSPECT the transaxle bearings. INSTALL new bearings as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle growling/humming - noise occurs in the forward gears. The noise is more prominent when the gear is loaded. The problem gear can be located as the noise occurs in a specific gear position	• Gear is cracked, chipped or rough	• INSPECT the transaxle gears for damage or wear. INSTALL new gears as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle hissing - noise in NEUTRAL or in forward gears. As bearings wear or break up, the noise changes to a thumping noise	• Damaged or worn bearings	• INSPECT the transaxle bearings. INSTALL new bearings as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle knocking/thudding - noise at low speeds in forward gears	• Bearings with damaged balls or rollers or with pitted and spalled races	• INSPECT the transaxle bearings. INSTALL new bearings as necessary. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.
• Transaxle rumble/growl - noise at all speeds in forward gears, more pronounced in a heavy acceleration condition	• Damaged or worn transaxle bearing or gears (high mileage vehicles)	• CHECK transaxle fluid for excessive metal particles. REPAIR as necessary.

Pinpoint Tests

Pinpoint Test A: Clutch Slippage

Normal Operation

The clutch is designed to transfer the power from the engine to the transaxle, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transaxle.

This pinpoint test is intended to diagnose the following:

- Clutch pedal
- Clutch pedal pivot

PINPOINT TEST A: CLUTCH SLIPPAGE

A1 INSPECT THE CLUTCH LINKAGE

- Key in OFF position.
- Apply the parking brake.
- Depress and slowly release the clutch pedal.
- **Does the clutch pedal release without binding?**

  YES : Go to A2.

  NO : INSPECT the clutch pedal for wear or damage. REPAIR as necessary. REFER to **CLUTCH CONTROLS** article.

A2 TEST CLUTCH SLIPPAGE

- Apply the parking brake.
- Start engine and engage 4th gear.
- Run the engine at approximately 2,000 RPM.
- Release clutch pedal slowly.
- **Does the engine stall when the clutch pedal is fully released?**

  YES : The clutch is not slipping. VERIFY customer concern.

  NO : Go to A3.

A3 MEASURE THE CLUTCH RESERVE

- Apply the parking brake.
- Start the engine.
- With the clutch pedal up, gently move the shift lever toward the REVERSE gear position.
- Hold the lever in position when gear clash can be heard.
- Slowly depress the clutch pedal.

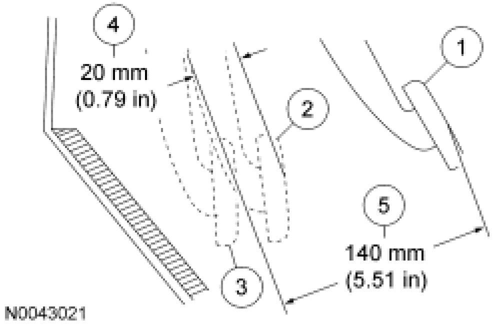

Fig. 1: Identifying Pedal Positions
Courtesy of FORD MOTOR CO.

- Stop and hold the clutch pedal when the gear clash stops. Measure the distance from when gear clash stops to the pedal fully depressed position. The difference between the measurement taken when the gear clash stopped and the measurement taken at the downstop is the clutch reserve.

Item	Pedal Position
1	Gear clash begins
2	Gear clash ends
3	Clutch pedal downstop
4	Clutch pedal disengagement stroke
5	Pedal stroke

- **Is the clutch reserve within specification?**

  YES : Clutch pedal reserve is OK. INSPECT the clutch pressure plate and clutch disc for wear or damage. INSTALL new components as necessary.

  NO : ADJUST the clutch pedal freeplay to specification. REFER to **Clutch Pedal Freeplay Adjustment**.

Pinpoint Test B:Clutch Chatter, Rattle or Shudder

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Engine or transmission mounts
- Clutch disc
- Clutch pressure plate
- Flywheel
- Pilot bearing
- Input shaft

PINPOINT TEST B: CLUTCH CHATTER, RATTLE OR SHUDDER

B1 CHECK THE ENGINE OR TRANSMISSION MOUNTS

- Inspect all the engine and transmission mounts for looseness or damage.
- **Are any of the engine or transmission mounts loose or damaged?**

  YES : TIGHTEN or INSTALL new engine mounts or transmission mounts. TEST the system for normal operation.

  NO : Go to B2.

B2 INSPECT THE PRESSURE PLATE BOLTS

- Inspect the pressure plate-to-flywheel bolts.
- **Are any of the pressure plate-to-flywheel bolts loose?**

  YES : TIGHTEN or INSTALL new bolts. REFER to **CLUTCH** article. TEST the system for normal operation.

  NO : Go to B3.

B3 INSPECT THE PRESSURE PLATE

- Remove the clutch pressure plate.
- Inspect the clutch pressure plate for wear or damage.
- **Are any signs of damage present on the clutch pressure plate?**

  YES : INSTALL a new clutch pressure plate. REFER to **CLUTCH** article. TEST the system for normal operation.

  NO : Go to B4.

B4 CHECK THE CLUTCH DISC

NOTE: **If the internal damper of the clutch disc is damaged or contaminated with grease or oil, it will sound similar to a "transmission rattle".**

- Check the clutch disc for wear or damage.
- **Is the clutch disc OK?**

  YES : Go to B5.

  NO : INSTALL a new clutch disc. REFER to **CLUTCH** article. TEST the system for normal operation.

B5 INSPECT THE FLYWHEEL

- Inspect the flywheel for wear or damage.
- **Is the flywheel OK?**

  YES : Go to B6.

  NO : REPAIR or INSTALL a new flywheel as necessary. REFER to **CLUTCH** article. TEST the system for normal operation.

B6 INSPECT THE INPUT SHAFT

- Inspect the input shaft for signs of wear or damage.
- **Are any signs of wear or damage present on the input shaft?**

  YES : INSTALL a new input shaft. REFER to **MANUAL TRANSAXLE/TRANSMISSION** article.

  NO : VERIFY the customer concerns.

Pinpoint Test C: Clutch Drag

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Fluid level
- Clutch pedal free play
- Clutch pressure plate
- Clutch pedal
- Clutch disc contamination

PINPOINT TEST C: CLUTCH DRAG

C1 CHECK THE FLUID LEVEL

- Key in OFF position.
- Inspect the fluid level in the brake master cylinder reservoir.
- **Is the fluid level within the MAX and MIN level marks?**

  YES : Go to C2.

  NO : ADD brake fluid and CHECK for leaks in the clutch and brake systems.

C2 CHECK CLUTCH PEDAL HEIGHT

- Measure the distance from the upper surface of the clutch pedal to the floor.
- **Is the clutch pedal height 210-216 mm (8.27-8.50 in)?**

YES : Go to C3.

NO : ADJUST the clutch pedal height. REFER to **Clutch Pedal Freeplay Adjustment**.

C3 CHECK THE CLUTCH PEDAL FREE PLAY

- Press the clutch pedal lightly by hand.
- Measure the distance the clutch pedal travels.
- **Is the clutch pedal travel within 5-13 mm (0.20-0.51 in)?**

YES : Go to C4.

NO : BLEED the clutch. REFER to **Clutch System Bleeding**.

C4 CHECK THE CLUTCH PRESSURE PLATE AND THE DIAPHRAGM SPRING

- Remove the transaxle. Refer to **MANUAL TRANSAXLE/TRANSMISSION** article.
- Inspect the clutch pressure plate for wear and the diaphragm spring for even diaphragm height. Refer to **Clutch Pressure Plate Check**.
- **Are there any signs of contamination or wear to the clutch pressure plate or diaphragm spring?**

YES : INSTALL a new clutch pressure plate. REFER to **CLUTCH** article.

NO : INSPECT the clutch disc for damage or excessive runout. REFER to **Clutch Disc Check**.

Pinpoint Test D: Clutch Pedal Pulsation

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Clutch disc
- Clutch pressure plate
- Flywheel

PINPOINT TEST D: CLUTCH PEDAL PULSATION

D1 CHECK THE CLUTCH PEDAL PULSATION

- Start engine.
- With the transmission in NEUTRAL, slowly press the clutch pedal.
- **Does the clutch pedal pulsate while being pressed?**

YES : Go to D2.

NO : VERIFY customer concern.

D2 INSPECT THE PRESSURE PLATE BOLTS

- Inspect the pressure plate-to-flywheel bolts.
- **Are any of the pressure plate-to-flywheel bolts loose?**

  YES : TIGHTEN or INSTALL new bolts. REFER to **CLUTCH** article. TEST the system for normal operation.

  NO : Go to D3.

D3 INSPECT THE CLUTCH PRESSURE PLATE

- Remove the clutch pressure plate. Refer to **CLUTCH** article.
- Inspect the clutch pressure plate for wear or damage.
- **Are there any signs of damage present on the clutch pressure plate?**

  YES : INSTALL a new clutch pressure plate. REFER to **CLUTCH** article. TEST the system for normal operation.

  NO : Go to D4.

D4 INSPECT THE CLUTCH DISC

- Check the clutch disc for wear or damage.
- **Is the clutch disc OK?**

  YES : Go to D5.

  NO : INSTALL a new clutch disc. REFER to **CLUTCH** article. TEST the system for normal operation.

D5 INSPECT THE FLYWHEEL

- Inspect the flywheel for wear or damage.
- **Is flywheel OK?**

  YES : VERIFY customer concern.

  NO : TIGHTEN or INSTALL a new flywheel as necessary. REFER to **ENGINE - 2.3L** article, **ENGINE - 3.0L (4V)** article or **ENGINE - 3.5L** article. TEST the system for normal operation.

Pinpoint Test E: Clutch Related Vibrations

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission

This pinpoint test is intended to diagnose the following:

- Engine components
- Accessory drive component

- Release bearing
- Flywheel

PINPOINT TEST E: CLUTCH RELATED VIBRATIONS

E1 CHECK FOR ENGINE COMPONENT GROUNDING

- With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
- Check the engine mount interlocks for grounding.
- Check for the exhaust manifold or other engine components grounding on the body or frame.
- **Is there evidence of grounding on the body or frame?**

  YES : REPAIR any components as necessary.

  NO : Go to E2.

E2 CHECK FOR ACCESSORY DRIVE VIBRATIONS

- Remove the accessory drive belt and check for vibration.
- **Does the vibration stop when the accessory drive belts are removed from the engine?**

  YES : REFER to **ACCESSORY DRIVE - 2.3L** article to diagnose the accessory drive belt components.

  NO : Go to E3.

E3 CHECK FOR RELEASE BEARING NOISE

- Key in START position.
- Press and hold the clutch pedal.
- **Is a whirring, grating or grinding noise present only when the pedal is pushed?**

  YES : INSTALL a new clutch slave cylinder. REFER to **CLUTCH CONTROLS** article.

  NO : Go to E4.

E4 INSPECT THE FLYWHEEL

- Remove the transaxle. Refer to **MANUAL TRANSAXLE/TRANSMISSION** article.
- Inspect for loose flywheel bolts.
- Check for an excessively burnt or severely cracked contact surface.
- Inspect the flywheel runout. Refer to **Flywheel Runout Check**.
- **Is the flywheel OK?**

  YES : Go to E5.

  NO : TIGHTEN or INSTALL a new flywheel. REFER to **ENGINE - 2.3L** article, **ENGINE - 3.0L (4V)** article or **ENGINE - 3.5L** article.

E5 CHECK FOR PRESSURE PLATE IMBALANCE

CAUTION: Failure to support the engine correctly could result in damage to the vehicle.

- Support the engine securely.

- Operate the engine with the transaxle removed.
- **Is the vibration still present?**

  YES : REFER to **NOISE, VIBRATION AND HARSHNESS** article to diagnose the engine vibration concern.

  NO : INSTALL a new clutch pressure plate. REFER to **CLUTCH** article.

Pinpoint Test F: Hard Shifting

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Transmission fluid level
- Clutch hydraulic fluid level
- Clutch pressure plate
- Shift linkage

PINPOINT TEST F: HARD SHIFTING

F1 CHECK THE FLUID LEVEL

- Key in OFF position.
- Inspect the fluid level in the brake master cylinder reservoir.
- **Is the fluid level within the MAX and MIN level marks?**

  YES : Go to F2.

  NO : ADD brake fluid and CHECK for leaks in the clutch and brake systems.

F2 CHECK THE CLUTCH PEDAL FREE PLAY

- Press the clutch pedal lightly by hand.
- Measure the distance the clutch pedal travels.
- **Is the clutch pedal travel within 5-13 mm (0.20-0.51 in)?**

  YES : REFER to **MANUAL TRANSAXLE/TRANSMISSION** article for transaxle concerns or **MANUAL TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article for gear shifter concerns.

  NO : CHECK the clutch pressure plate for damage. REFER to **Clutch Pressure Plate Check**.

Pinpoint Test G: Excessive Noise

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Internal transaxle components
- Clutch pedal
- Clutch slave cylinder
- Clutch pressure plate
- Clutch disc

PINPOINT TEST G: EXCESSIVE NOISE

G1 TRANSAXLE NEUTRAL GEAR ROLLOVER TEST

- Start the engine and let it idle.

NOTE: With the clutch pedal fully pressed, the input shaft should stop rotating.

- Press the clutch pedal.
- **Does the noise stop when the clutch pedal is pressed?**

  YES : REFER to **MANUAL TRANSAXLE/TRANSMISSION** article for transaxle concerns.

  NO : Go to G2.

G2 CHECK THE CLUTCH PEDAL FREE PLAY

- Press the clutch pedal lightly by hand.
- Measure the distance the clutch pedal travels.
- **Is the clutch pedal travel within 5-13 mm (0.20-0.51 in)?**

  YES : Go to G3.

  NO : CHECK the clutch pressure plate for damage. REFER to **Clutch Pressure Plate Check**.

G3 CHECK THE CLUTCH SLAVE CYLINDER

- Remove the transaxle. Refer to **MANUAL TRANSAXLE/TRANSMISSION** article.
- Inspect the clutch slave cylinder for wear or loss of lubrication.
- **Are there signs of wear or loss of lubrication?**

  YES : INSTALL a new clutch slave cylinder. REFER to **CLUTCH CONTROLS** article.

  NO : Go to G4.

G4 CHECK THE TORSION SPRINGS

- Inspect the torsion springs for fatigue or breakage.
- **Are there any signs of fatigue or breakage?**

  YES : INSTALL a new clutch pressure plate. REFER to **CLUTCH** article.

  NO : INSPECT the crankshaft end play. REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article.

Pinpoint Test H: Fluid Leakage

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Clutch master cylinder
- Clutch slave cylinder
- Hydraulic tubes

PINPOINT TEST H: FLUID LEAKAGE

H1 INSPECT THE CLUTCH MASTER CYLINDER

- Inspect clutch master cylinder for leakage.
- **Is the clutch master cylinder OK?**

  YES : Go to H2.

  NO : REPAIR or INSTALL a new clutch master cylinder as necessary. REFER to **CLUTCH CONTROLS** article.

H2 INSPECT THE CLUTCH SLAVE CYLINDER

- Inspect clutch slave cylinder for leaks.
- **Is the clutch slave cylinder OK?**

  YES : Go to H3.

  NO : REPAIR or INSTALL a new clutch slave cylinder as necessary. REFER to **CLUTCH CONTROLS** article.

H3 INSPECT THE SYSTEM HYDRAULIC TUBES

- Inspect clutch hydraulic tubes for loose or damaged fittings causing leakage.
- **Are the clutch hydraulic tubes OK?**

  YES : Carry out a road test to VERIFY customer complaint.

NO : REPAIR or INSTALL new components as necessary. TEST the clutch system for normal operation.

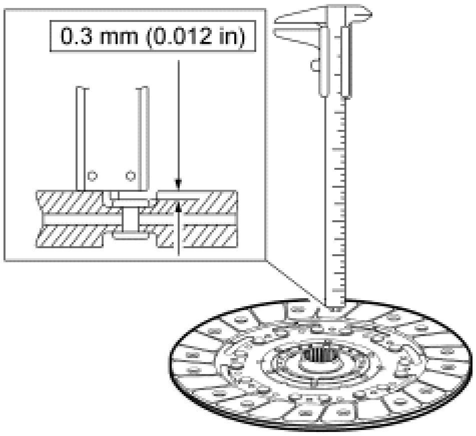
GENERAL PROCEDURES

CLUTCH DISC CHECK

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	Dial Indicator with Magnetic Base	100-D002 (D78P-4201-B) or equivalent

1. Check the clutch disc lining surface for hardening, the presence of oil or grease.
2. Check for a worn clutch disc lining. Measure the minimum allowable depth to the rivet heads with a slide caliper.
    - If the measurement is less than the minimum, install a new clutch disc.



A0092278

Fig. 2: Measuring Minimum Allowable Depth With Specifications
Courtesy of FORD MOTOR CO.

3. Check for loose clutch disc lining rivets.

- Install a new clutch disc as necessary.

4. Check the clutch disc for cracking, scoring, discoloration or other surface marks.
   - Install a new clutch disc if necessary.
5. Using the special tool, check the maximum allowable runout of the clutch disc.
   - If the runout exceeds the maximum, install a new clutch disc.

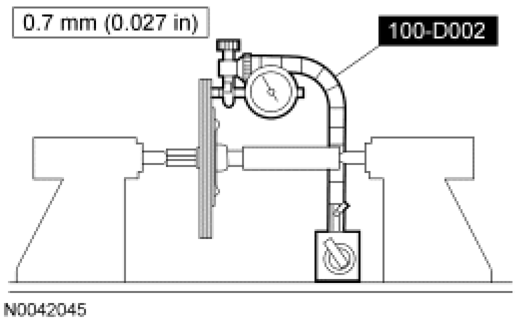


Fig. 3: Checking Maximum Allowable Runout Of Clutch Disc
Courtesy of FORD MOTOR CO.

6. Use an emery cloth to remove minor imperfections in the clutch disc lining surface.
7. Check for wear or rust on the splines. If necessary, clean them with an emery cloth.

CLUTCH PEDAL FREEPLAY ADJUSTMENT

1. Measure the clutch pedal height.
   1. If the measurement is not within specification, turn the adjustment bolt as necessary.
   2. Tighten the lock nut.
      - Recheck the measurement.

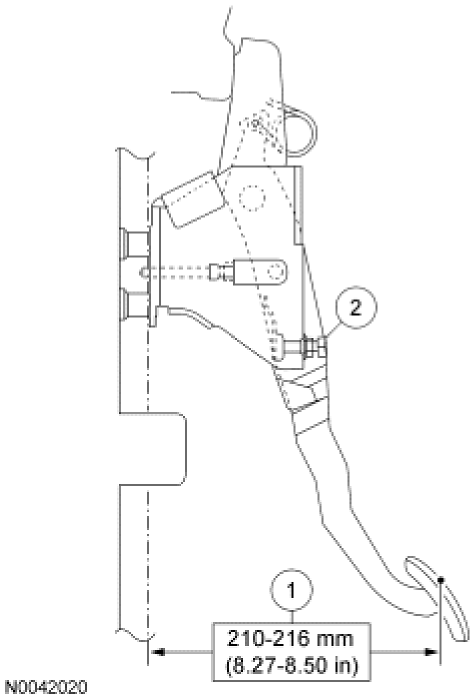

Fig. 4: Measuring Clutch Pedal Height
Courtesy of FORD MOTOR CO.

2. Measure clutch pedal free play.
    1. Depress the clutch pedal by hand until the push rod contacts the clutch master cylinder piston.
    2. If the measurement is not within specification, loosen the lock nut and turn the push rod as necessary.
        - Recheck the measurement.

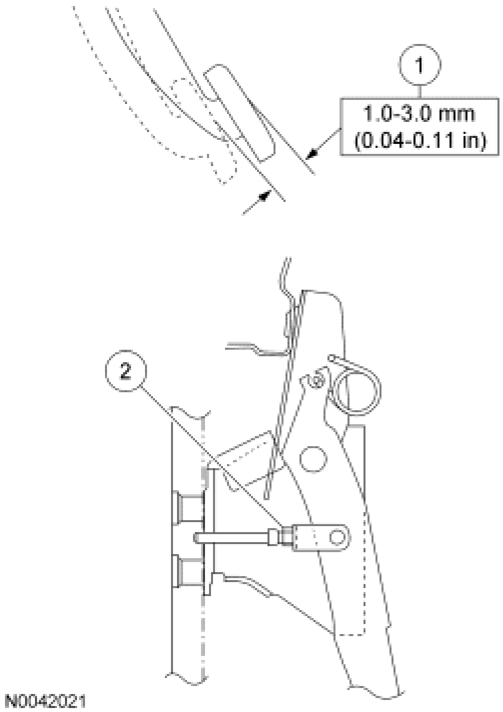

Fig. 5: Measuring Clutch Pedal Free Play
Courtesy of FORD MOTOR CO.

CLUTCH PRESSURE PLATE CHECK

1. Check the clutch pressure plate surface for scoring, cracks or discoloration.
    - Minor scratches or discoloration should be removed with a fine emery cloth.
2. Measure the flatness of the clutch pressure plate surface with a straightedge and a feeler gauge.
    - Install a new pressure plate as necessary.

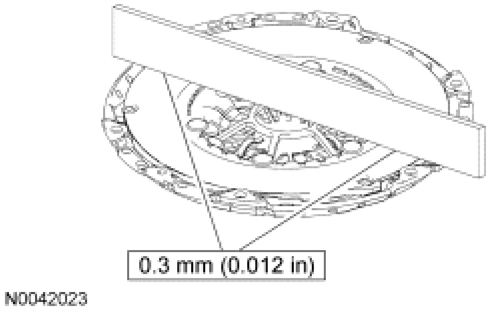

Fig. 6: Measuring Flatness Of Clutch Pressure Plate Surface With Straightedge And Feeler Gauge
Courtesy of FORD MOTOR CO.

3. Check the diaphragm spring fingers for discoloration, scoring and bent or broken segments.
4. Measure the wear of the diaphragm spring fingers.
    - Install a new pressure plate as necessary.

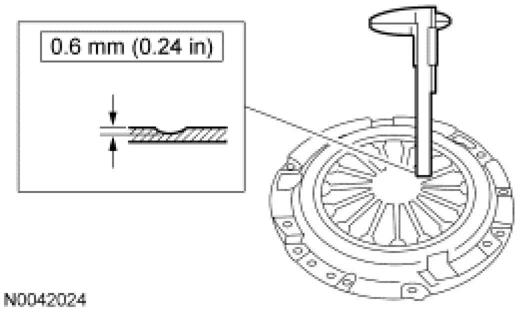

Fig. 7: Measuring Wear Of Diaphragm Spring Fingers
Courtesy of FORD MOTOR CO.

FLYWHEEL RUNOUT CHECK

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	Dial Indicator with Magnetic Base	100-D002 (D78P-4201-B) or equivalent

1. Mount the special tool so that the indicator contact point rides on the clutch disc contact surface.
2. Rotate the flywheel and check the runout.
   - If the runout exceeds the maximum allowance, install a new flywheel.

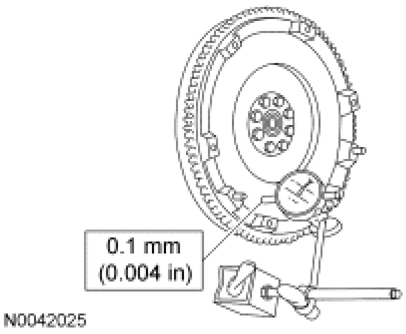

Fig. 8: Measuring Flywheel Runout
Courtesy of FORD MOTOR CO.

CLUTCH SYSTEM BLEEDING

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid	WSS-M6C62-A

PM-1-C (US); CPM-1-C (Canada)	

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with cold water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean brake fluid.
2. Slowly pump the clutch pedal to the floor several times and hold it.
3. With the clutch pedal held to the floor, loosen the bleeder screw until fluid and air are expelled from the system.

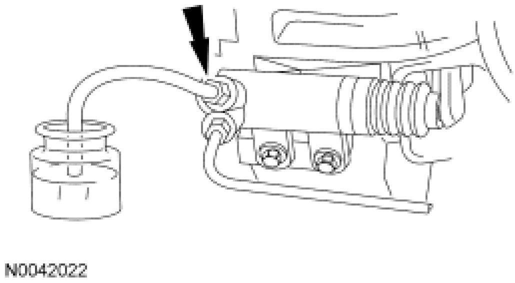

Fig. 9: Bleeding Clutch Hydraulic System
Courtesy of FORD MOTOR CO.

4. With the clutch pedal held to the floor, tighten the bleeder screw.

NOTE: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

5. Repeat Steps 2 through 4 until no air bubbles appear in the fluid.

6. Tighten the bleeder screw.
    - Tighten to 7 Nm (62 lb-in).
7. Add brake fluid to the reservoir. Fill to the level in between the MIN and MAX lines.
8. Check system for normal operation.

GEARSHIFT CABLE ADJUSTMENT

1. Set the parking brake.
2. Remove the gearshift knob and the floor console finish panel.
3. Disengage the safety lock by sliding it away from the shifter ball stud.

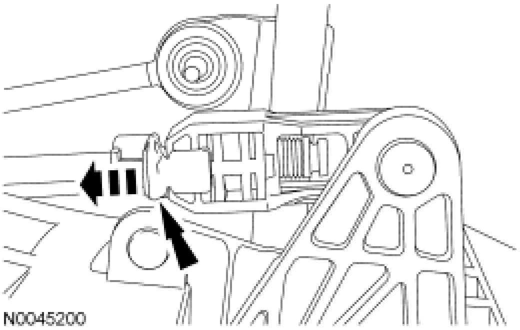

Fig. 10: Disengaging Safety Lock
Courtesy of FORD MOTOR CO.

NOTE: **If the cable lock is difficult to slide out, disconnect the shift cable from the stud, push the lock from the rear and reattach the shift cable to the ball stud.**

4. Disengage the cable lock by sliding it out from the shift cable end fitting.

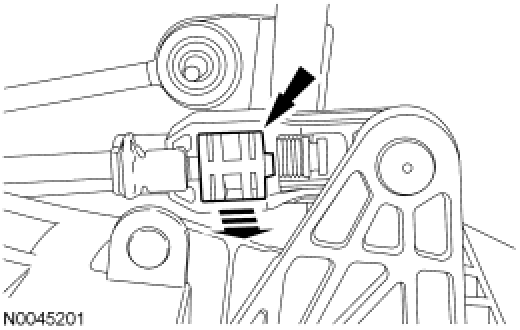

Fig. 11: Disengaging Cable Lock
Courtesy of FORD MOTOR CO.

5. Move the shift lever to the center position. With the shifter and the transmission in NEUTRAL, push the cable lock onto the cable.

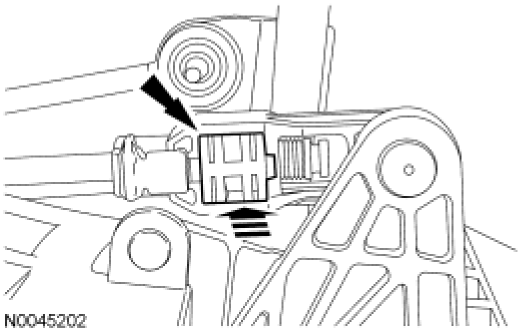

Fig. 12: Pushing Cable Lock Onto Cable
Courtesy of FORD MOTOR CO.

6. Engage the safety lock by sliding it over the primary shift cable lock.

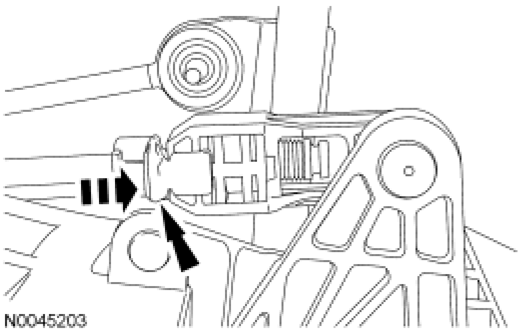

Fig. 13: Engaging Safety Lock
Courtesy of FORD MOTOR CO.

7. Install the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.

2008 ENGINE PERFORMANCE

Mode 6 - 2008 Ford - Except Diesel

INTRODUCTION

Mode 6 is designed to allow access to the results of onboard diagnostic monitoring tests of specific components/systems that are not continuously monitored. These systems include the catalytic converter, EVAP system, oxygen sensor, oxygen sensor heater, EGR system, secondary AIR system, and sometimes misfire.

Mode 6 data is output from the PCM/ECM in hexadecimal form. The $ sign indicates a hexadecimal number. Depending on the software in the scanner, the output could be displayed in hexadecimal numbers (no conversion), raw data (conversion to decimal numbers), or measurable values (applying conversion factor to raw data).

Before reading mode 6 information, ensure that the monitor for the information you are accessing has run to completion. If the monitor is not complete, the mode 6 data will not be accurate.

CATALYST MONITOR

TYPICAL MALFUNCTION THRESHOLDS:
Rear-to-front O2 sensor index ratio > 0.75 (bank monitor)
Rear-to-front O2 sensor index-ratio > 0.60 (Y-pipe monitor)
Rear-to-front O2 sensor index ratio > 0.50 for E10 to > 0.90 for E85 (flex fuel vehicles)

J1979 CATALYST MONITOR MODE $06 DATA			
Monitor ID	Test ID	Description for CAN	
$21	$80	Bank 1 index-ratio and max. limit	unitless
$22	$80	Bank 2 index-ratio and max. limit	unitless

G00152358

Fig. 1: Mode $06 Data For Catalyst Monitor
Courtesy of FORD MOTOR CO.

MISFIRE MONITOR

Typical misfire monitor malfunction thresholds:
Type A (catalyst damaging misfire rate): misfire rate is an rpm/load table ranging from 40% at idle to 4% at high rpm and loads
Type B (emission threshold rate): 1% to 2%

J1979 Misfire Mode $06 Data			
Monitor ID	Test ID	Description for CAN	
A1	$80	Total engine misfire and catalyst damage misfire rate (updated every 200 revolutions)	percent
A1	$81	Total engine misfire and emission threshold misfire rate (updated every 1,000 revolutions)	percent
A1	$82	Highest catalyst-damage misfire and catalyst damage threshold misfire rate (updated when DTC set or clears)	percent
A1	$83	Highest emission-threshold misfire and emission threshold misfire rate (updated when DTC set or clears)	percent
A1	$84	Inferred catalyst mid-bed temperature	°C
A2 – AD	$0B	EWMA misfire counts for last 10 driving cycles	events
A2 – AD	$0C	Misfire counts for last/current driving cycle	events
A2 – AD	$80	Cylinder X misfire rate and catalyst damage misfire rate (updated every 200 revolutions)	percent
A2 – AD	$81	Cylinder X misfire rate and emission threshold misfire rate (updated every 1,000 revolutions)	percent

G00152359

Fig. 2: Mode $06 Data For Misfire Monitor
Courtesy of FORD MOTOR CO.

AIR SYSTEM MONITOR

Typical AIR functional check malfunction thresholds:
On and Off Flow ratio < 0.4 (P0491 - Low Flow or, P0410 - Inlet Hose Off)
On Flow ratio > 1.6 (P2448 – Outlet Hose Off)

J1979 Secondary Air Mode $06 Data			
Mon ID	Comp ID	Description for CAN	Units
$72	$80	HO2S21 voltage for upstream flow test and rich limit	volts
$72	$81	HO2S lean timer test	
$72	$82	On Flow Ratio and limits	unitless
$72	$83	Off Flow Ratio and limits	unitless
$72	$84	Flow Ratio AF indicator and limits PETA_AF_SHIFT	unitless
$72	$85	Timer to indicate if a valid AF shift can be calculated PETA_CL_TMR	seconds

G00152360

Fig. 3: Mode $06 Data For AIR System Monitor
Courtesy of FORD MOTOR CO.

EVAP MONITOR

Typical 0.040 EVAP monitor malfunction thresholds:
P1450 (Excessive vacuum): < -8.0 in H_2O over a 30 second evaluation time or > -4. in H_2O vapor generation
P0455 (Gross leak): > -8.0 in H_2O over a 30 second evaluation time.
P0457 (Gross leak, cap off): > -8.0 in H_2O over a 30 second evaluation time after a refueling event.
P0442 (0.040" leak): > 2.5 in H_2O bleed-up over a 15 second evaluation time at 75% fuel fill. (Note: bleed-up and evaluation times vary as a function of fuel fill level and ambient air temperature)
P0442 vapor generation limit: < 2.5 in H_2O over a 120 second evaluation time

J1979 Evaporative System Mode $06 Data			
Test ID	Comp ID	Description	Units
$61	$00	Phase 0 Initial tank vacuum and minimum vacuum limit (data for P1450 – excessive vacuum)	in H_20
$62	$00	Phase 4 Vapor generation minimum change in pressure and minimum vacuum limit (data for P1450, VMV stuck open)	in H_20
$63	$00	Phase 0 Initial tank vacuum and gross leak maximum vacuum limit (data for P0455/P0457 – gross leak/cap off)	in H_20
$64	$00	Phase 2 0.040" cruise leak check vacuum bleed-up and maximum vacuum limit (data for P0442 – 0.040" leak)	in H_20
Note: Default values (0.0 in H_20) will be displayed for all the above TIDs if the evap monitor has never completed. Each TID is associated with a particular DTC. The TID for the appropriate DTC will be updated based on the current or last driving cycle, default values will be displayed for any phases that have not completed.			

G00152361

Fig. 4: Mode $06 Data For EVAP Monitor (0.040" Leak)
Courtesy of FORD MOTOR CO.

Typical 0.020 EVAP monitor malfunction thresholds:

P1450 (Excessive vacuum): < -8.0 in H_2O over a 30 second evaluation time or > -4. in H_2O vapor generation.

P0455 (Gross leak): > -8.0 in H_2O over a 30 second evaluation time.

P0457 (Gross leak, cap off): > -8.0 in H_2O over a 30 second evaluation time after a refueling event.

P0442 (0.040" leak): > 2.5 in H_2O bleed-up over a 15 sec. evaluation time at 75% fuel fill.

(Note: bleed-up and evaluation times vary as a function of fuel fill level and ambient temperature).

P0456 (0.020" leak): > 2.5 in H_2O bleed-up over a 30 sec. evaluation time at 75% fuel fill.

(Note: bleed-up and evaluation times vary as a function of fuel fill level and ambient temperature)

P0442 vapor generation limit: < 2.5 in H_2O over a 100 second evaluation time.

J1979 Evaporative System Mode $06 Data

Monitor ID	Test ID	Description for CAN	Units
$3A	$80	Phase 0 Initial tank vacuum and minimum vacuum limit (data for P1450 – excessive vacuum)	Pascals
$3A	$81	Phase 4 Vapor generation minimum change in pressure and minimum vacuum limit (data for P1450, VMV stuck open)	Pascals
$3A	$82	Phase 0 Initial tank vacuum and gross leak maximum vacuum limit (data for P0455/P0457 – gross leak/cap off)	Pascals
$3B	$80	Phase 2 0.040" cruise leak check vacuum bleed-up and maximum vacuum limit (data for P0442 – 0.040" leak)	Pascals
$3C	$80	Phase 2 0.020" idle leak check vacuum bleed-up and maximum vacuum limit (data for P0456 – 0.020" leak)	Pascals
Note: Default values (0.0 in H_20) will be displayed for all the above TIDs if the evap monitor has never completed. Each TID is associated with a particular DTC. The TID for the appropriate DTC will be updated based on the current or last driving cycle, default values will be displayed for any phases that have not completed.			

G00152362

Fig. 5: Mode $06 Data For EVAP Monitor (0.020" Leak)
Courtesy of FORD MOTOR CO.

Typical 0.020 EONV EVAP monitor malfunction thresholds:
P0456 (0.020" leak): < 0.75 in H_2O pressure build and < 0.50 in H_2O vacuum build over a 45 minute maximum evaluation time
Note: EONV monitor can be calibrated to illuminate the MIL after two malfunctions (an average of four key-off EONV tests, eight runs in all) or after a single malfunction (an average of five key-off EONV tests, five runs in all). Most new 2006 MY and later vehicles will use the five-run approach.

J1979 EONV EVAP monitor Mode $06 Data			
Monitor ID	Comp ID	Description for CAN	Units
$3C	$81	EONV Positive Pressure Test Result and Limits	in H_20
$3C	$82	EONV Negative Pressure (Vacuum) Test Result and Limits	in H_20
$3C	$83	Normalized Average of Four EONV Tests Results and Limits (where 0 = pass, 1 = fail)	unitless
Note: Default values (0.0 in H_20) will be displayed for all the above TIDs if the evap monitor has never completed. The appropriate TID will be updated based on the current or last driving cycle, default values will be displayed for any phases that have not completed.

FRONT HO2S MONITOR

Typical HO2Sresponse rate malfunction thresholds:
Voltage amplitude: < 0.5 volts

J1979 Front HO2S Mode $06 Data			
Monitor ID	Test ID	Description for CAN	
$01	$80	HO2S11 voltage amplitude and voltage threshold	Volts
$01	$01	H02S11 sensor switch-point voltage	Volts
$05	$80	HO2S21 voltage amplitude and voltage threshold	Volts
$05	$01	H02S21 sensor switch-point voltage	Volts

G00152364

Fig. 7: Mode $06 Data For Front HO2S Monitor
Courtesy of FORD MOTOR CO.

REAR HO2S MONITOR

Typical Rear HO2S functional check malfunction thresholds:
Does not exceed rich and lean threshold envelope:
Rich < 0.42 volts
Lean > 0.48 volts
> 1.1 volts for 25 seconds for over voltage test

J1979 Rear HO2S Functional Check Mode $06 Data			
Monitor ID	Test ID	Description for CAN	
$02	$01	HO2S12 sensor switch-point voltage	volts
$06	$01	HO2S22 sensor switch-point voltage	volts
$03	$01	HO2S13 sensor switch-point voltage	volts
$07	$01	HO2S23 sensor switch-point voltage	volts

G00152365

Fig. 8: Mode $06 Data For Rear HO2S Functional Check Monitor

2008 ACCESSORIES & BODY, CAB

Module Communications Network - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

COMMUNICATIONS NETWORK

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Vehicle communication utilizes both medium and high speed controller area network (CAN) communications. CAN is used for many modules to communicate with each other on a common network. CAN in-vehicle networking is a method for transferring data among distributed electronic modules using a serial data bus. Without serial networking, intermodule communication requires dedicated, point to point wiring resulting in bulky, expensive, complex, and difficult to install wiring harnesses. Applying a serial data network reduces the number of wires, thereby combining the signals on a single network. Information is sent to the individual control modules that control each function.

The vehicle has 2 module communication networks:

- Medium speed (MS) CAN
- High speed (HS) CAN

Both networks are connected to the data link connector (DLC), located under the dash. This makes diagnosis and testing of these systems easier by allowing one scan tool to be able to diagnose and control any module on both networks from one connector. The DLC can be found under the instrument panel between the steering column and the audio control module (ACM).

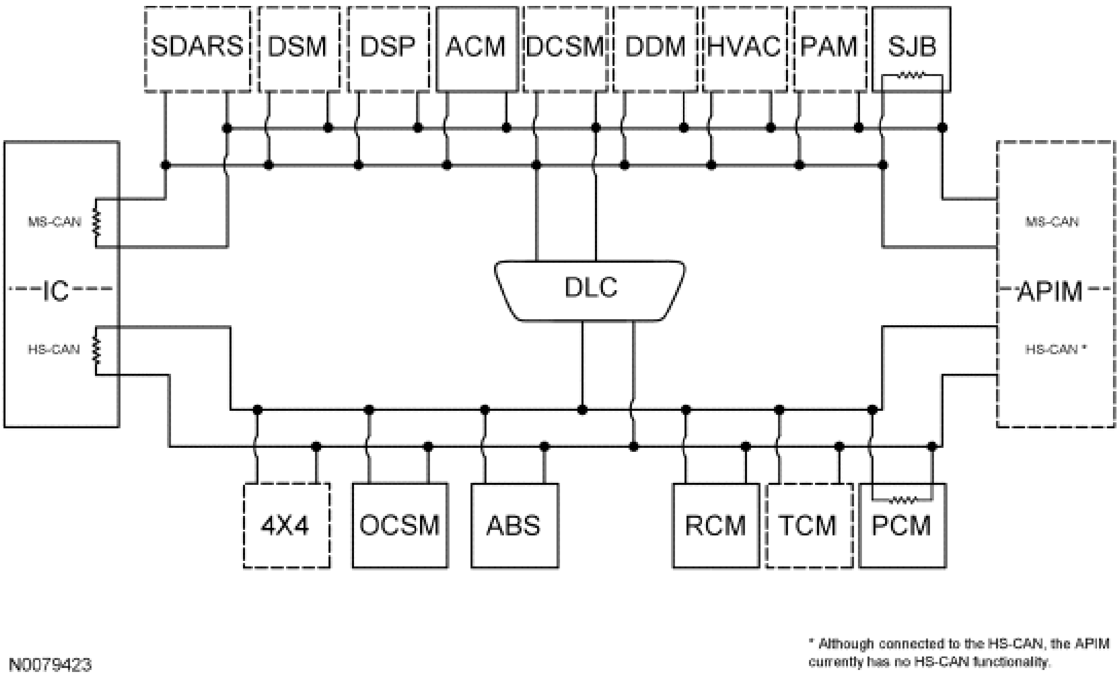

Fig. 1: Network Topology
Courtesy of FORD MOTOR CO.

Module Name	Network Type	Termination Module
Accessory protocol interface module (APIM) (if equipped)	HS-CAN MS-CAN	No No
Audio control module (ACM)	MS-CAN	No
Audio digital signal processing (DSP) module (if equipped)	MS-CAN	No
ABS module	HS-CAN	No
Driver door module (DDM) (if equipped)	MS-CAN	No
Driver seat module (DSM) (if equipped)	MS-CAN	No
Heating ventilation air conditioning (HVAC) module (if equipped)	MS-CAN	No
Dual climate control seat module (DCSM) (if equipped)	MS-CAN	No
4X4 control module (if equipped)	HS-CAN	No
Instrument cluster (IC) (gateway module)	HS-CAN MS-CAN	Yes Yes
Occupant classification system module (OCSM)	HS-CAN	No
PCM	HS-CAN	Yes
Restraints control module (RCM)	HS-CAN	No

Smart junction box (SJB)	MS-CAN	Yes
Satellite digital audio receiver system (SDARS) module (if equipped)	MS-CAN	No
Transmission control module (TCM)	HS-CAN	No

MS-CAN Operation

The MS-CAN communicates using bussed messages. The MS-CAN has an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The MS-CAN is a medium speed communication network used for the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver door module (DDM) (if equipped)
- Driver seat module (DSM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module
- Instrument cluster (IC)
- Parking aid module (PAM)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

HS-CAN Operation

The HS-CAN communicates using bussed messages. The HS-CAN uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The HS-CAN is a high speed communication network used for the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- ABS module
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- PCM
- Restraints control module (RCM)
- Transmission control module (TCM) (if equipped)
- 4X4 control module

Network Termination

The CAN uses a network termination circuit to improve communication reliability. The network termination of the CAN bus takes place inside the termination modules by termination resistors. Termination modules are located at either end of the bus network. As network messages are broadcast in the form of voltage signals, the network voltage signals are stabilized by the termination resistors. Each termination module has a 120 ohm resistor across the positive and negative bus connection in the termination module. With 2 termination modules on each network and the 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance, is 60 ohms.

Network termination improves bus message reliability by:

- stabilizing bus voltage.
- eliminating electrical interference.

Gateway Module

The IC is the gateway module, translating HS-CAN to MS-CAN and vice versa. This information allows a message to be distributed throughout both networks. The IC is the only module on this vehicle that has this ability.

DIAGNOSTIC TESTS

COMMUNICATIONS NETWORK

Special Tools

Illustration	Tool Name	Tool Number

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Vehicle communication utilizes both medium and high speed controller area network (CAN) communications. CAN is a method for transferring data among distributed electronic modules using a serial data bus.

The vehicle is equipped with 2 module communication networks:

- Medium speed (MS) CAN
- High speed (HS) CAN

MS-CAN

The MS-CAN is a medium speed communication network that uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other. The MS-CAN will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The MS-CAN may remain operational when 1 of the 2 termination resistors are not present.

The MS-CAN operates at a maximum data transfer speed of 125 Kbps for bus messages and designed for general information transfer. The network will remain operational, but at a degraded level when certain circuit faults are present. The MS-CAN may remain operational with only one termination resistor present.

The following modules are on the MS-CAN:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver door module (DDM) (if equipped)
- Driver seat module (DSM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)

- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

The following fault chart describes the specific MS-CAN failures and their resulting symptom:

MS-CAN COMMUNICATION FAULT CHART

Failure Description	Symptom
MS-CAN (+) shorted to MS-CAN (-)	No communication
MS-CAN (+) short to voltage	No communication
MS-CAN (-) short to voltage	No communication
MS-CAN (+) short to ground	No communication
MS-CAN (-) short to ground	Unreliable communication possible in all network modules
MS-CAN (+) open	Unreliable communication possible in all network modules
MS-CAN (-) open	Unreliable communication possible in all network modules
Module loss of voltage or ground	No communication
Module internal failure	No communication

HS-CAN

The HS-CAN is a high speed communication network that uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other. The HS-CAN will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The HS-CAN bus may remain operational when 1 of the 2 termination resistors are not present.

The HS-CAN operates at a maximum data transfer speed of 500 Kbps and is designed for real time information transfer and control. The network will remain operational, but at a degraded level when certain circuit faults are present. The HS-CAN may remain operational with only one termination resistor present.

The following modules are on the HS-CAN:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- PCM
- Restraints control module (RCM)

- Transmission control module (TCM)
- 4X4 control module (if equipped)

The following fault chart describes the specific HS-CAN failures and their resulting symptom:

HS-CAN COMMUNICATION FAULT CHART

Failure Description	Symptom
HS-CAN (+) shorted to HS-CAN (-)	No communication
HS-CAN (+) short to voltage	No communication
HS-CAN (-) short to voltage	No communication
HS-CAN (+) short to ground	No communication
HS-CAN (-) short to ground	Unreliable communication possible in all network modules
HS-CAN (+) open	Unreliable communication possible in all network modules
HS-CAN (-) open	Unreliable communication possible in all network modules
Module loss of voltage or ground	No communication
Module internal failure	No communication

NOTE: This chart describes the specific high speed controller area network (HS-CAN) and medium speed controller area network (MS-CAN) messages broadcast by each module, and the module(s) that receive the message.

CAN MODULE COMMUNICATION MESSAGE CHART

Broadcast Message	Originating Module	Network Type	Receiving Module(s)
ABS event in progress	ABS module	HS-CAN	• PCM • Restraints control module (RCM) • Transmission control module (TCM)
ABS/TRAC system configuration	ABS module	HS-CAN	• TCM
ABS malfunction indicator request	ABS module	HS-CAN	• Instrument cluster (IC)
A/C clutch inhibit request	TCM	HS-CAN	• PCM
A/C clutch request	Heating ventilation air conditioning (HVAC) module	MS-CAN	• IC
A/C clutch request (gateway)	IC	HS-CAN	• PCM
A/C clutch status	PCM	HS-CAN	• IC

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Battery junction box (BJB) fuse(s):

- 11 (30A) (no communication with dual climate control seat module [DCSM])
- 12 (30A) (no communication with DCSM)
- 13 (10A) (no communication with accessory protocol interface module [APIM])
- 15 (10A) (no communication with driver seat module [DSM])
- 16 (15A) (no communication with transmission control module [TCM])
- 19 (40A) (no communication with smart junction box [SJB])
- 20 (20A) (no communication with audio digital signal processing [DSP] module)
- 21 (20A) (no communication with audio DSP module)
- 23 (10A) (no communication with TCM-FNR5 transaxle, PCM)
- 23 (10A) (no communication with the PCM)
- 26 (7.5A) (no communication with the PCM)
- 42 (15A) (no communication with the PCM, 3.0L and 3.5L engines)
- 47 (15A) (no communication with the PCM, 2.3L engine)

- SJB fuse(s):
  - 12 (7.5A) (no communication with audio control module [ACM])
  - 13 (10A) (no communication with instrument cluster [IC], heating ventilation air conditioning [HVAC] module)
  - 18 (20A) (no power to scan tool, no communication with ACM)
  - 20 (7.5A) (no communication with driver door module [DDM], satellite digital audio receiver system [SDARS] module, 4X4 control module)
  - 23 (7.5A) (no communication with IC)
  - 24 (7.5A) (no communication with occupant classification system module [OCSM])
  - 25 (7.5A) (no communication with restraints control module [RCM])
  - 26 (7.5A) (no communication with TCM, PCM)
  - 27 (7.5A) (no communication with HVAC module, IC)

- 28 (10A) (no communication with ABS module, 4X4 control module, PAM)
- Data link connector (DLC)
- Wiring harness
- Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

4. If the cause is not visually evident, connect the scan tool to the DLC.

   If the scan tool does not communicate with the VCM:

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Go to **Pinpoint Test V**, to diagnose no power to the scan tool.

NOTE: During the network test, the scan tool will first attempt to communicate with the PCM, after establishing communication with the PCM, the scan tool will then attempt to communicate with all other modules on the vehicle.

5. Carry out the network test.
   - If the network test passes, retrieve and record the continuous memory DTCs and proceed to Step 6.
   - If the network test fails, go to **Symptom Chart** to identify the module not communicating.

NOTE: Follow the non-network DTC diagnostics (BXXXX, CXXXX, PXXXX) prior to the network DTC diagnostics (UXXXX).

6. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
7. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as faulty wiring or low battery voltage occurrences. Additionally, vehicle service procedures such as module reprogramming will often set network DTCs.

Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery, refer to BATTERY, MOUNTING AND CABLES article.

NOTE: **DTC U1900 will set in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module.**

COMMUNICATION NETWORK DTC CHART

DTC	Description	Source	Action
U0002	High Speed CAN Communication Bus Performance	Instrument cluster (IC)	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0020	Low Speed CAN Communication Bus Performance	IC	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0073	Control Module Communication Bus Off	Heating ventilation air conditioning (HVAC) module	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0073	Control Module Communication Bus Off	Smart junction box (SJB)	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0073	Control Module Communication Bus Off	Transmission control module (TCM)	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0100	Lost Communication With ECM/PCM	4X4 control module	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0100	Lost Communication With ECM/PCM	TCM	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0101	Lost Communication With TCM	4X4 control module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	4X4 control module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the

			network test.
U0140	Lost Communication With Body Control Module (GEM)	Audio control module (ACM)	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0140	Lost Communication With Body Control Module (GEM)	HVAC module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0140	Lost Communication With Body Control Module (GEM)	Parking aid module (PAM)	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0155	Lost Communication With Instrument Cluster Module	ACM	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0155	Lost Communication With Instrument Cluster Module	Audio digital signal processing (DSP) module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0155	Lost Communication With Instrument Cluster Module	HVAC module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0155	Lost Communication With Instrument Cluster Module	PAM	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0155	Lost Communication With Instrument Cluster Module	4X4 control module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0159	Lost Communication With Parking Assist Control Module (PAM)	ACM	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0184	Lost Communication With Radio (ACM)	Accessory protocol interface module (APIM)	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0184	Lost Communication With Radio (ACM)	DSP module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0184	Lost Communication With	Satellite digital	CLEAR the DTC. REPEAT the network test

	Radio (ACM)	audio receiver system (SDARS) module	with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0193	Lost Communication With Digital Audio Control Module (SDARS)	ACM	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	APIM	DISREGARD this DTC.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	ACM	DISREGARD this DTC.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	SDARS module	DISREGARD this DTC.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DSP module	DISREGARD this DTC.
U0197	Lost Communication With Telephone Control Module	ACM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
U0197	Lost Communication With Telephone Control Module	DSP module	DISREGARD this DTC.
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DSP module	DISREGARD this DTC.
U0238	Lost Communication With Digital Audio Control Module "D" (DSP)	ACM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
U0246	Lost Communication With Seat Control Module (DCSM)	HVAC module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module which fails the network test.
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	ACM	DISREGARD this DTC.
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	APIM	DISREGARD this DTC.
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	SDARS module	DISREGARD this DTC.
U0255	Lost Communication With Front Controls Interface Module	APIM	DISREGARD this DTC.

U0255	Lost Communication With Front Controls Interface Module	SDARS module	DISREGARD this DTC.
U0256	Lost Communication With Front Display Interface Module	APIM	DISREGARD this DTC.
U0256	Lost Communication With Front Display Interface Module	SDARS module	DISREGARD this DTC.
U0401	Invalid Data Received from ECM/PCM A	4X4 control module	RETRIEVE and FOLLOW the DTCs from the PCM.
U0402	Invalid Data Received from TCM	4X4 control module	RETRIEVE and FOLLOW the DTCs from the TCM.
U0415	Invalid Data Received from Anti-Lock Brake System (ABS) Control Module	4X4 control module	RETRIEVE and FOLLOW the DTCs from the ABS module.
U1900	CAN Communication Bus Fault-Receive Error	ABS module	Go to **Symptom Chart** for module that failed network test.
U1900	CAN Communication Bus Fault-Receive Error	Driver seat module (DSM)	Go to **Symptom Chart** for module that failed network test.
U1900	CAN Communication Bus Fault-Receive Error	IC	Go to **Symptom Chart** for module that failed network test.
U1900	CAN Communication Bus Fault-Receive Error	RCM	Go to **Symptom Chart** for module that failed network test.
U1900	CAN Communication Bus Fault-Receive Error	SJB	Go to **Symptom Chart** for module that failed network test.
U1900	CAN Communication Bus Fault-Receive Error	Occupant classification system module (OCSM)	Go to **Symptom Chart**. for module that failed network test.
U1901	CAN #2 Communication Bus Fault - Receive Error	IC	The module had an invalid network input/message from another module. RETRIEVE and FOLLOW the non-network DTCs from other modules. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.
U2013	Compass Module is not Responding	IC	RETRIEVE and FOLLOW the non-network DTCs from other modules. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
U2023	Fault Received From External Node	ABS module	The module had an invalid network input/message from another module. RETRIEVE and FOLLOW the non-network DTCs from other modules. REFER to **MULTIFUNCTION ELECTRONIC**

			MODULES article.
U2023	Fault Received From External Node	IC	The module had an invalid network input/message from another module. RETRIEVE and FOLLOW the non-network DTCs from other modules. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.
U2510	CAN - Invalid data for Vehicle Security	IC	The module had an invalid network input/message from another module. RETRIEVE and FOLLOW the non-network DTCs from other modules. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
U2511	CAN - Data Mis-Match (Receive data does not match expected)	IC	The module had an invalid network input/message from another module. RETRIEVE and FOLLOW the non-network DTCs from other modules. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The PCM does not respond to the scan tool	• Wiring, terminals or connectors • PCM	• REFER to the **Introduction - Gasoline Engines** article, pinpoint test QA before proceeding to Pinpoint Test A. If pinpoint test QA has been completed, go to **Pinpoint Test A**.
• The transmission control module (TCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • TCM	• Go to **Pinpoint Test B**.
• The ABS module does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • ABS module	• Go to **Pinpoint Test C**.
• The restraints control module (RCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • Case ground open	• Go to **Pinpoint Test D**.

	• RCM	
• The 4X4 control module (if equipped) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • 4X4 control module	• Go to **Pinpoint Test E**.
• The occupant classification system module (OCSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • OCSM	• Go to **Pinpoint Test F**.
• The instrument cluster (IC) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • IC	• Go to **Pinpoint Test G**.
• The smart junction box (SJB) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test H**.
• The heating ventilation air conditioning (HVAC) module (if equipped) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • HVAC module	• Go to **Pinpoint Test I**.
• The parking aid module (PAM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • PAM	• Go to **Pinpoint Test J**.
• The audio control module (ACM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • ACM	• Go to **Pinpoint Test K**.
• The audio digital signal processing (DSP) module not respond to the scan tool	• Fuse • Wiring, terminals or connectors • DSP module	• Go to **Pinpoint Test L**.
• The satellite digital audio receiver system (SDARS) module does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • SDARS module	• Go to **Pinpoint Test M**.
	• Fuse	

• The driver door module (DDM) does not respond to the scan tool	• Wiring, terminals or connectors • DDM	• Go to **Pinpoint Test N**.
• The driver seat module (DSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • DSM	• Go to **Pinpoint Test O**.
• The dual climate control seat module (DCSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • DCSM	• Go to **Pinpoint Test P**.
• The accessory protocol interface module (APIM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • APIM	• Go to **Pinpoint Test Q**.
• No medium speed controller area network (MS-CAN) communication, all modules are not responding	• Wiring, terminals or connectors • APIM (if equipped) • ACM • DSP module (if equipped) • DDM (if equipped) • DSM (if equipped) • DCSM (if equipped) • HVAC module (if equipped) • IC • PAM (if equipped) • SDARS module (if equipped) • SJB	• Go to **Pinpoint Test R**.
• Intermittent no medium speed controller area network (MS-CAN) communication, one or more modules are not responding during network test	• Wiring, terminals or connectors	• Go to **Pinpoint Test S**.
	• Wiring, terminals or connectors • ABS module	

• No high speed controller area network (HS-CAN) communication, all modules are not responding	• APIM (if equipped) • IC • OCSM • PCM • RCM • TCM • 4X4 control module (if equipped)	• Go to **Pinpoint Test T**.
• Intermittent no high speed controller area network (HS-CAN) communication, one or more modules are not responding during network test	• Wiring, terminals or connectors	• Go to **Pinpoint Test U**.
• No power to the scan tool	• Fuse • Wiring, terminals or connectors • Scan tool	• Go to **Pinpoint Test V**.

Pinpoint Tests

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Electronic Engine Controls - 3.5L for schematic and connector information.

Normal Operation

The PCM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the PCM.

The PCM shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- Restraints control module (RCM)
- Transmission control module (TCM) (if equipped)
- 4X4 control module (if equipped)

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

A1 POWERTRAIN CONTROL/EMISSIONS DIAGNOSIS (PC/ED) MANUAL PINPOINT TEST QA VERIFICATION CHECK

- Verify that the PC/ED pinpoint test QA has been performed.
- **Has the PC/ED pinpoint test QA been performed?**

  YES : Go to A2.

  NO : REFER to **Introduction - Gasoline Engines** article, pinpoint test QA, to diagnose no communication with the PCM.

A2 CHECK THE HS-CAN TERMINATION RESISTANCE

- Key in OFF position.

NOTE: **Failure to disconnect the battery will result in false resistance readings.**

- Disconnect the battery ground cable.

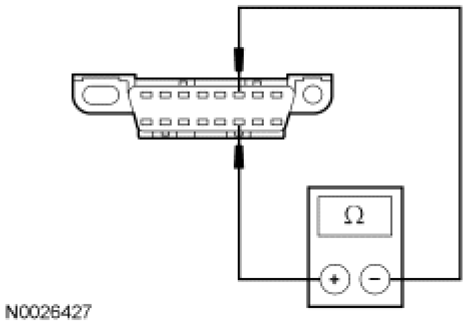

Fig. 2: Checking HS-CAN Termination Resistance

Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance between 54 and 66 ohms?**

  YES : Go to A4.

  NO : Go to A3.

A3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN

- Disconnect: PCM C175b

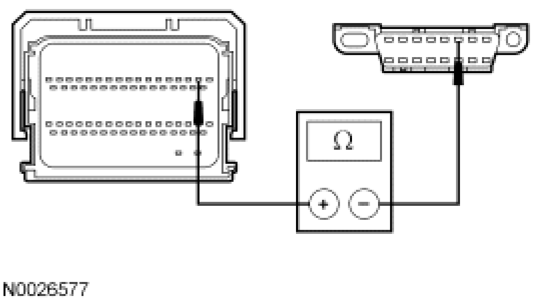

Fig. 3: Checking HS-CAN (+) Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

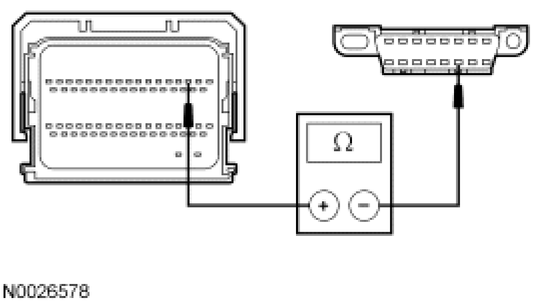

Fig. 4: Checking HS-CAN (-) Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to A4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

A4 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test B: The Transmission Control Module (TCM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Transmission Controls - 6 Speed for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Transmission Controls - FNR5 for schematic and connector information.

Normal Operation

The transmission control module (TCM) communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the TCM. The FNR5 transaxle TCM and the 6-speed transaxle TCM both communicate on the HS-CAN. Voltage for the TCM is provided by circuits CBP18 (GY/OG), SBP07 (WH/RD) and SBB16 (VT/RD). Both circuits GD120 (BK/GN) provide ground.

The TCM shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)

- PCM
- Restraints control module (RCM)
- 4X4 control module (if equipped)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- TCM

PINPOINT TEST B: THE TRANSMISSION CONTROL MODULE (TCM) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

B1 CHECK THE TCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: TCM C2352a (FNR5 Transaxle)
- Disconnect: TCM C1533 (6-Speed Transaxle)
- Key in ON position.

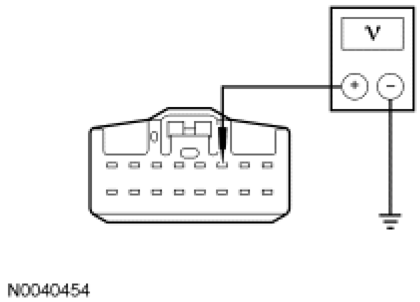

Fig. 5: Checking Power From Smart Junction Box (SJB)
Courtesy of FORD MOTOR CO.

- For FNR5 transaxles, measure the voltage between the TCM C2352a-3, circuit SBP23 (WH/RD), harness side and ground.

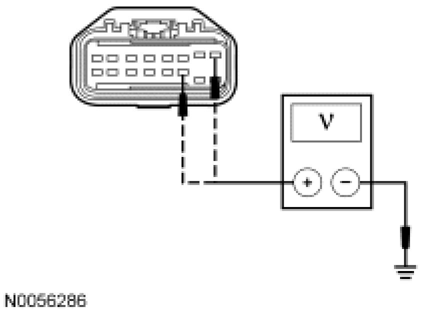

Fig. 6: Checking TCM Voltage Supply Circuits For An Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- For 6-speed transaxles, measure the voltage between the TCM C1533-1, circuit SBB16 (VT/RD), harness side and ground; and between the TCM C1533-11, circuit CBP18 (GY/OG), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to B2.

  NO : For FNR5 transaxles, VERIFY the battery junction box (BJB) fuse 23 (10A) is OK.

  For 6-speed transaxles, VERIFY the battery junction box (BJB) fuse 16 (15A) or SJB fuse 26 (7.5A), are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

B2 CHECK THE TCM GROUND(S)

- Key in OFF position.

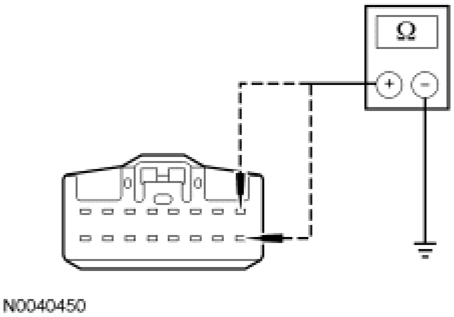

Fig. 7: Checking TCM Ground Supply Circuit For Open
Courtesy of FORD MOTOR CO.

- For FNR5 transaxles, measure the resistance between the TCM C2352a-1, circuit GD120 (BK/GN), harness side and ground; and between the TCM C2352a-9, circuit GD120 (BK/GN), harness side and ground.

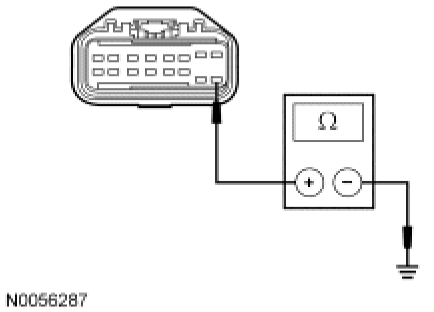

Fig. 8: Checking TCM Ground Supply Circuit For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- For 6-speed transaxles, measure the resistance between TCM C1533-9, circuit GD120 (BK/GN), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : For FNR5 transaxles, go to B3 .

  For 6-speed transaxles, go to B4 .

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

B3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE FNR5 TRANSAXLE TCM FOR AN OPEN

- Disconnect: TCM C2352b

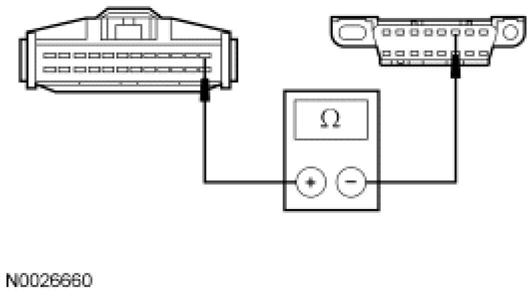

Fig. 9: Checking High Speed CAN Circuits Between DLC And TCM C2352B For Open (1 Of 2)
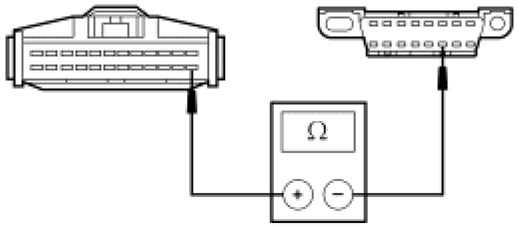
Courtesy of FORD MOTOR CO.

- Measure the resistance between the TCM C2352b-1, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.



N0026661

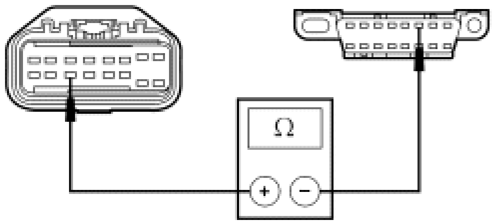
Fig. 10: Checking High Speed CAN Circuits Between DLC And TCM C2352B For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the TCM C2352b-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to B5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

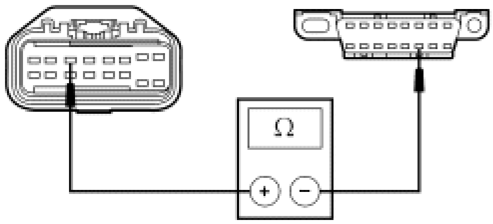
B4 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE 6-SPEED TRANSAXLE TCM FOR AN OPEN



N0026662

Fig. 11: Checking High Speed CAN Circuits Between DLC And TCM C1533 For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the TCM C1533-14, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.



N0026663

Fig. 12: Checking High Speed CAN Circuits Between DLC And TCM C1533 For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the TCM C1533-6, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to B5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

B5 CHECK FOR CORRECT TCM OPERATION

- Disconnect the TCM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the TCM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new TCM. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test C: The ABS module Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the ABS module. Voltage for the ABS module is provided by circuit CBP19 (BN/WH). Ground is provided by circuit GD123 (BK/GY).

The ABS module shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- PCM
- Restraints control module (RCM)
- Transmission control module (TCM) (if equipped)
- 4X4 control module (if equipped)

This pinpoint test is intended to diagnose the following:

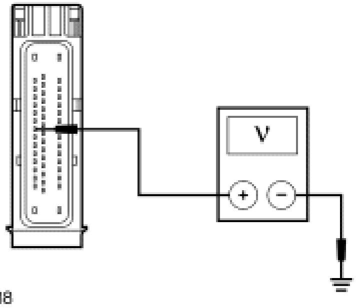
- Fuse
- Wiring, terminals or connectors
- ABS module

PINPOINT TEST C: THE ABS module DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

C1 CHECK THE ABS MODULE VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: ABS Module C135
- Key in ON position.



N0056288

Fig. 13: Checking Circuit CBP19 (BN/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the ABS module C135-8, circuit CBP19 (BN/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C2.

  NO : VERIFY the smart junction box (SJB) fuse 28 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

C2 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

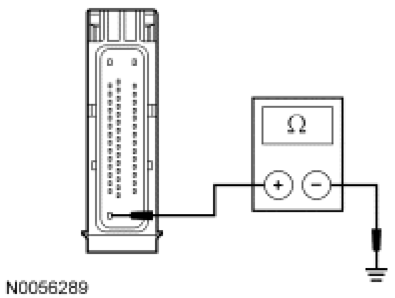


Fig. 14: Checking Circuit GD123 (BK/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the ABS module C135-16, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

C3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE ABS MODULE FOR AN OPEN

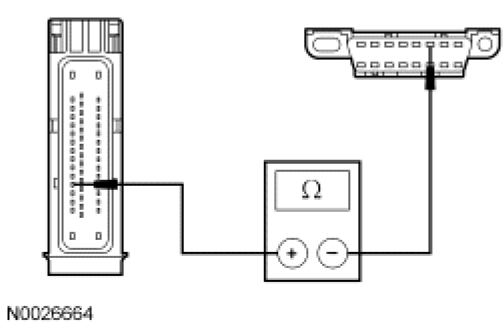

Fig. 15: Checking High Speed CAN Circuits Between DLC And ABS Module For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the ABS module C135-12, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

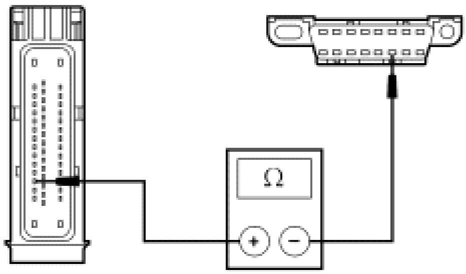

Fig. 16: Checking High Speed CAN Circuits Between DLC And ABS Module For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the ABS module C135-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

C4 CHECK FOR CORRECT ABS MODULE OPERATION

- Disconnect the ABS module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the ABS module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **VEHICLE DYNAMIC SYSTEMS** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test D: The Restraints Control Module (RCM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for

Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the RCM. Voltage for the RCM is provided by circuit CBP21 (BU/GY), and the RCM is case grounded.

The RCM shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- PCM
- Transmission control module (TCM) (if equipped)
- 4X4 control module (if equipped)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Case ground open
- RCM

PINPOINT TEST D: THE RESTRAINTS CONTROL MODULE (RCM) DOES NOT RESPOND TO THE SCAN TOOL

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough

inspection and verification before proceeding with the pinpoint test.

D1 CHECK THE RCM CONNECTION

- Key in OFF position.
- Depower the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: RCM C310a
- Disconnect: RCM C310b
- **Are RCM C310a pin 24, and RCM C310b pins 17 and 18 OK?**

  YES : Go to D2.

  NO : REPAIR the RCM connector pins as necessary. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

D2 CHECK THE RCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Deactivate the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Repower the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Key in ON position.

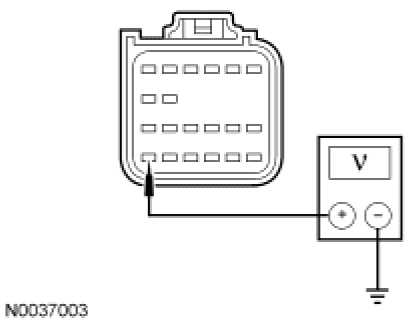

Fig. 17: Checking RCM Voltage Supply Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the RCM C310a-24, circuit CBP21 (BU/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to D3.

  NO : VERIFY the smart junction box (SJB) fuse 25 (7.5A) is OK. If OK, REPAIR the circuit. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

D3 CHECK THE RCM CASE GROUND

- Key in OFF position.
- Measure the resistance between the RCM case and a good chassis ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to D4.

NO : REPAIR the RCM case ground as necessary. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

D4 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE RCM FOR AN OPEN

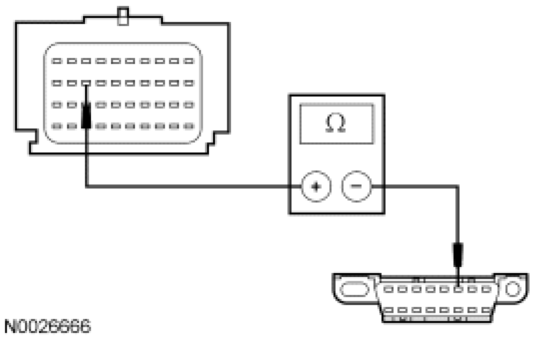

Fig. 18: Measuring Resistance Between RCM C310B-18 & DLC C251-6, Circuit VDB04 (WH/BU) & VDB04 (WH/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the RCM C310b-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

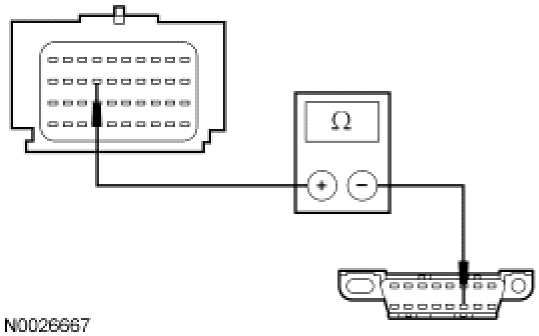

Fig. 19: Measuring Resistance Between RCM C310B-17 & DLC C251-14, Circuit VDB05 (WH) & VDB05 (WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the RCM C310b-17, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D5.

  NO : REPAIR the circuit in question. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

D5 CHECK FOR CORRECT RCM OPERATION

- Disconnect all the RCM connectors.
- Check for:

    - corrosion
    - damaged pins
    - pushed-out pins
- Connect all the RCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new RCM. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test E: The 4X4 Control Module Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, All-Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The 4X4 control module communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the 4X4 control module. Voltage to the 4X4 control module is supplied by circuits CBP19 (BN/WH) and SBP15 (WH/RD). Ground is supplied by circuit GD126 (BK/WH).

The 4X4 control module shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- PCM
- Restraints control module (RCM)
- Transmission control module (TCM) (if equipped)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- 4X4 control module

PINPOINT TEST E: THE 4X4 CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK VOLTAGE TO THE 4X4 CONTROL MODULE

- Key in OFF position.
- Disconnect: 4X4 Control Module C3253
- Key in ON position.

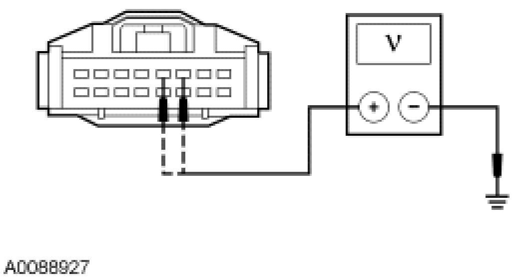

Fig. 20: Checking Voltage To 4X4 Control Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between the 4X4 control module C3253-5, circuit CBP19 (BN/WH), harness side and ground; and between the 4X4 control module C3253-6, circuit SBP15 (WH/RD), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to E2.

  NO : VERIFY the smart junction box (SJB) fuse 20 (7.5A) or 28 (10A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

E2 CHECK THE 4X4 CONTROL MODULE GROUND

- Key in OFF position.

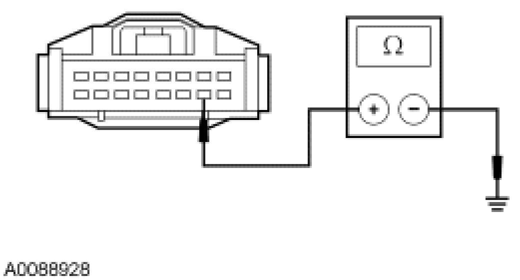

Fig. 21: Checking 4X4 Control Module Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the 4X4 control module C3253-15, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

E3 CHECK THE HS-CAN CIRCUITS BETWEEN THE 4X4 CONTROL MODULE AND THE DATA LINK CONNECTOR (DLC) FOR AN OPEN

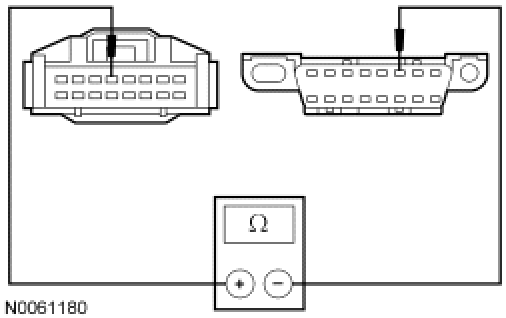

Fig. 22: Measuring Resistance Between 4WD Control Module C281-4, Circuit VDB04 (WH/BU) & DLC C251-6
Courtesy of FORD MOTOR CO.

- Measure the resistance between the 4X4 control module C3253-4, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

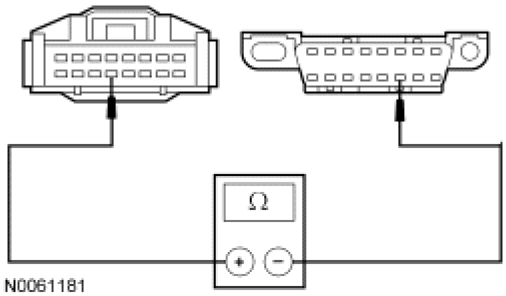

Fig. 23: Measuring Resistance Between 4WD Control Module C281-12, Circuit VDB05 (WH) & DLC C251-14
Courtesy of FORD MOTOR CO.

- Measure the resistance between the 4X4 control module C3253-12, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to E4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

E4 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect all the 4X4 control module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the 4X4 control module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test F: The Occupant Classification System Module (OCSM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The occupant classification system module (OCSM) communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the OCSM. Voltage to the OCSM is supplied by circuit CBP24 (VT/GN). Ground is supplied by circuit GD127 (BK/BU).

The OCSM shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- PCM
- Restraints control module (RCM)
- Transmission control module (TCM) (if equipped)
- 4X4 control module (if equipped)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- OCSM

PINPOINT TEST F: THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DOES NOT RESPOND TO THE SCAN TOOL

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

F1 CHECK THE OCSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: OCSM C3159
- Deactivate the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Repower the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Key in ON position.

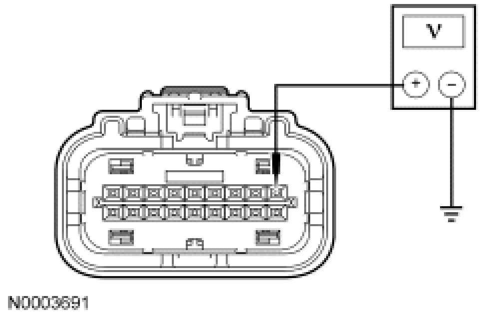

Fig. 24: Checking OCSM Voltage Supply Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the OCSM C3159-1, circuit CBP24 (VT/GN), harness side and

ground.

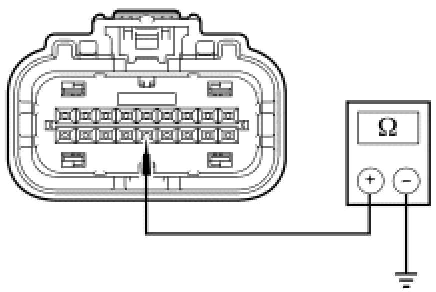
- **Is the voltage greater than 10 volts?**

  YES : Go to F2.

  NO : VERIFY the smart junction box (SJB) fuse 24 (7.5A) is OK. If OK, REPAIR the circuit. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

F2 CHECK THE OCSM GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.



N0003692

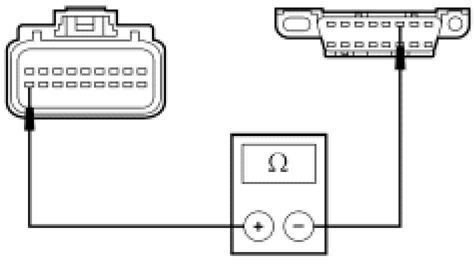
Fig. 25: Checking OCSM Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the OCSM C3159-14, circuit GD127 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F3.

  NO : REPAIR the circuit. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

F3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE OCSM FOR AN OPEN



N0026670

Fig. 26: Measuring Resistance Between OCSM C3159-18 & DLC C251-6, Circuit VDB04 (WH/BU) & VDB04 (WH/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the OCSM C3159-18, circuit VDB04 (WH/BU), harness side and

the DLC C251-6, circuit VDB04 (WH/BU), harness side.

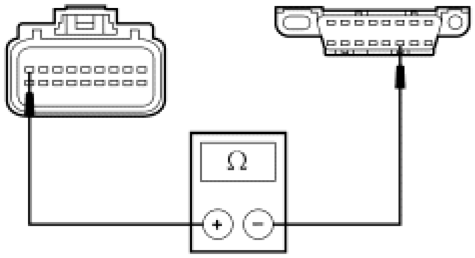


Fig. 27: Measuring Resistance Between OCSM C3159-9 & DLC C251-14, Circuit VDB05 (WH) & VDB05 (WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the OCSM C3159-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to F4.

  NO : REPAIR the circuit. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

F4 CHECK FOR CORRECT OCSM OPERATION

- Disconnect the OCSM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the OCSM connector and make sure it seats correctly.
- Verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new OCSM. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. REACTIVATE the SRS. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test G: The Instrument Cluster (IC) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for

Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster (IC) communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the HS-CAN connection to the IC and circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the MS-CAN connection to the IC. Voltage for the IC is provided by circuits CBP23 (BN/YE), SBP07 (WH/RD) and CBP20 (YE/VT). Circuit GD116 (BK/VT) provides ground.

The IC shares the HS-CAN with the following modules:

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- PCM
- Restraints control module (RCM)
- Transmission control module (TCM) (if equipped)
- 4X4 control module (if equipped)

The IC shares the MS-CAN with the following modules:

- APIM (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- IC

PINPOINT TEST G: THE INSTRUMENT CLUSTER (IC) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

G1 CHECK THE HS-CAN TERMINATION RESISTANCE

- Key in OFF position.

NOTE: **Failure to disconnect the battery will result in false resistance readings.**

- Disconnect the battery ground cable.
- Disconnect the scan tool cable from the data link connector (DLC).

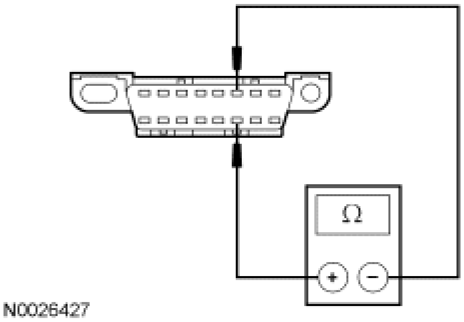

Fig. 28: Checking HS-CAN Termination Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance between 54 and 66 ohms?**

  YES : Go to G2.

  NO : Go to G4.

G2 CHECK THE INSTRUMENT CLUSTER (IC) VOLTAGE SUPPLY

- Disconnect: IC C220
- Connect the battery ground cable.
- Key in ON position.
- Measure the voltage between the IC, harness side and ground as follows:

IC Connector-Pin	Circuit
C220-6	CBP23 (BN/YE)
C220-19	SBP07 (WH/RD)
	CBP20

C220-20	(YE/VT)

- **Are the voltages greater than 10 volts?**

  YES : Go to G3.

  NO : VERIFY the smart junction box (SJB) fuses 13 (10A), 23 (7.5A), or 27 (7.5A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

G3 CHECK THE IC GROUND CIRCUITS

- Key in OFF position.
- Measure the resistance between the IC, harness side and ground as follows:

IC Connector-Pin	Circuit
C220-9	GD116 (BK/VT)
C220-10	GD116 (BK/VT)

- **Are the resistances less than 5 ohms?**

  YES : Go to G5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

G4 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE IC FOR AN OPEN

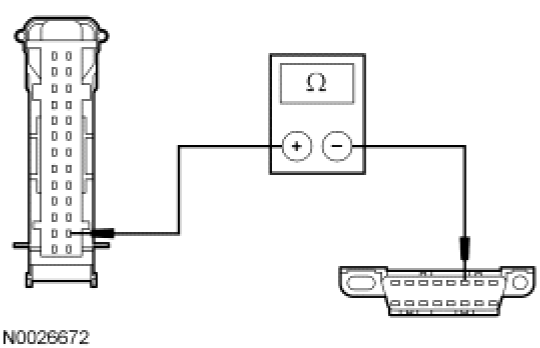

Fig. 29: Measuring Resistance Between IC C220-15 & DLC C251-6, Circuit VDB04 (WH/BU) & VDB04 (WH/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-15, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

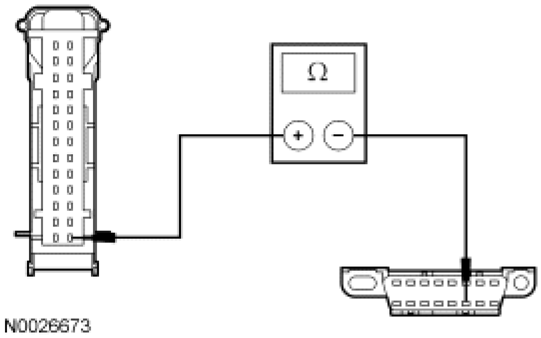

Fig. 30: Measuring Resistance Between IC C220-14 & DLC C251-14, Circuit VDB05 (WH) & VDB05 (WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-14, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to G5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

G5 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE INSTRUMENT CLUSTER (IC) FOR AN OPEN

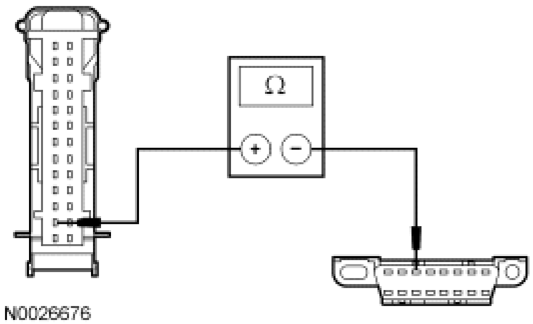

Fig. 31: Measuring Resistance Between IC C220-2 & DLC C251-3, Circuit VDB06 (GY/OG) & VDB06 (GY/OG)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-2, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

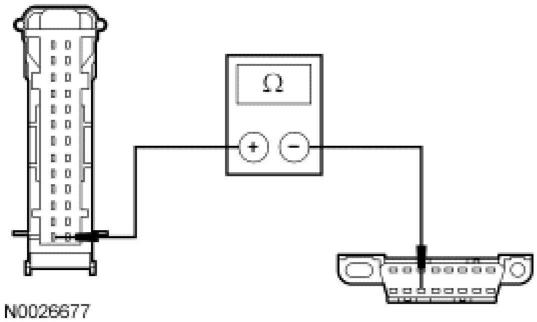

Fig. 32: Measuring Resistance Between IC C220-1 & DLC C251-11, Circuit VDB07 (VT/OG) & VDB07 (VT/OG)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to G6.

  NO : REPAIR the circuit in question. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

G6 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test H: The Smart Junction Box (SJB) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Grounds for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Distribution/SJB for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Normal Operation

The smart junction box (SJB) communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the SJB. Voltage for the SJB is provided by circuit SBB19 (BU/RD). Circuit GD116 (BK/VT) provides ground.

The SJB shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST H: THE SMART JUNCTION BOX (SJB) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

H1 CHECK THE SJB VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a
- Key in ON position.

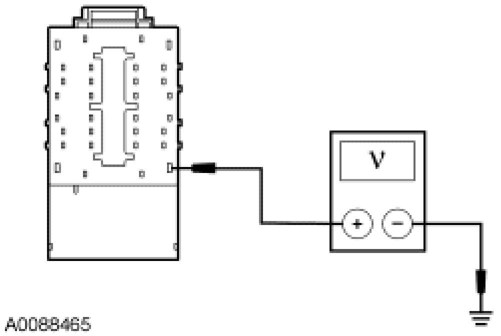

Fig. 33: Checking SJB Voltage Supply Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the SJB C2280a-4, circuit SBB19 (BU/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to H2.

  NO : VERIFY the battery junction box (BJB) fuse 19 (40A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

H2 CHECK THE SJB GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280d

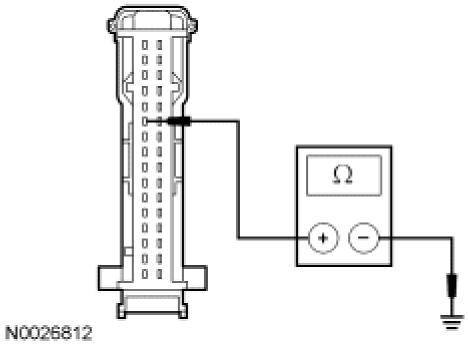

Fig. 34: Checking SJB Ground Circuit GD116 (BK/VT) For An Open
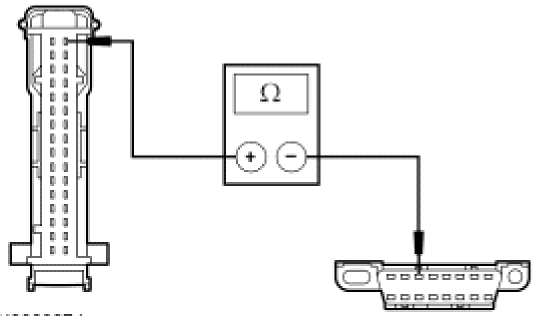
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-6, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to H3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

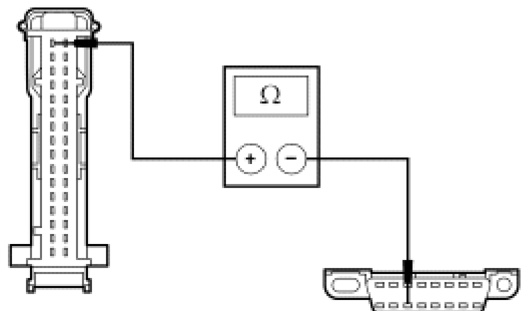
H3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE SJB FOR AN OPEN



N0026674

Fig. 35: Checking Medium Speed CAN Circuits Between DLC And SJB For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-17, circuit VDB06 (GY/OG) , harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.



N0026675

Fig. 36: Checking Medium Speed CAN Circuits Between DLC And SJB For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to H4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

H4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES**

article. CLEAR the DTCs. REPEAT the network test with the scan tool.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test I: The Heating Ventilation Air Conditioning (HVAC) Module Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

The vehicle may be equipped with either a single-zone or dual-zone automatic HVAC module or a manual (non-HVAC) climate control system. This test diagnoses the HVAC module systems. Voltage for the HVAC module is provided by circuits CBP20 (YE/VT) and SBP07 (WH/RD). Circuit GD116 (BK/VT) provides ground.

The HVAC module shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- HVAC module

PINPOINT TEST I: THE HEATING VENTILATION AIR CONDITIONING (HVAC) MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

I1 CHECK THE HVAC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module C228a (Single-Zone) or C2356a (Dual-Zone)
- Key in ON position.
- Measure the voltage between the HVAC module C228a-26 (single-zone) or HVAC module C2356a-26 (dual-zone), circuit SBP07 (WH/RD) circuit CBP20 (YE/VT), harness side and ground.

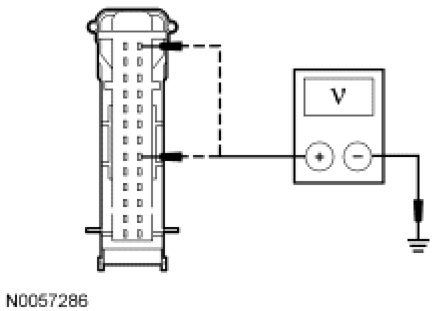


Fig. 37: Checking HVAC Voltage Supply Circuits For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the HVAC module C228a-19 (single-zone) or HVAC module C2356a-19 (dual-zone), circuit CBP20 (YE/VT), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to I2.

  NO : VERIFY smart junction box (SJB) fuses 13 (10A) or 27 (7.5A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

I2 CHECK THE HVAC GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

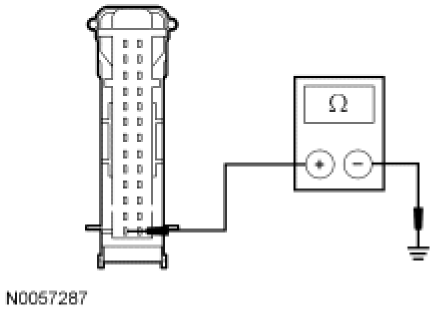

Fig. 38: Checking HVAC Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the HVAC module C228a-1 (single-zone) or C2356a-1 (dual-zone), circuit GD116 (BK/VT) and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to I3.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

I3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE HVAC MODULE FOR AN OPEN

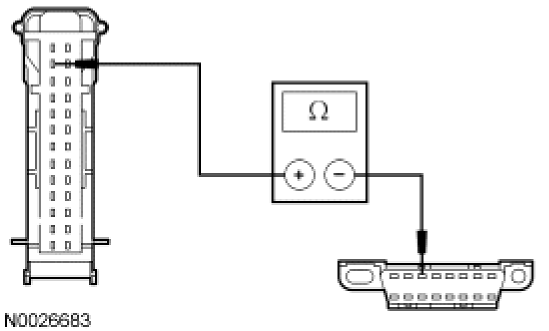

Fig. 39: Checking Medium Speed CAN Circuits Between DLC And EATC Module Or DATC Module For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the HVAC module C228a-12 (single-zone) or C2356a-12 (dual-zone), circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

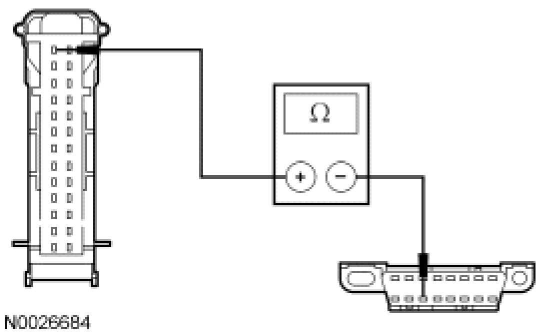

Fig. 40: Checking Medium Speed CAN Circuits Between DLC And EATC Module Or DATC Module For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the HVAC module C228a-13 (single-zone) or C2356a-13 (dual-zone), circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to I4.

  NO : REPAIR the circuit as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

I4 CHECK FOR CORRECT HVAC MODULE OPERATION

- Disconnect all the HVAC module connectors.

- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the HVAC module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test J: The Parking Aid Module (PAM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking Aid for schematic and connector information.

Normal Operation

The parking aid module (PAM) communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the PAM. Voltage for the PAM is provided by circuit CBP35 (YE/GY). Circuit GD133 (BK) provides ground.

The PAM shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- PAM

PINPOINT TEST J: THE PARKING AID MODULE (PAM) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

J1 CHECK THE PAM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: PAM C4014
- Key in ON position.

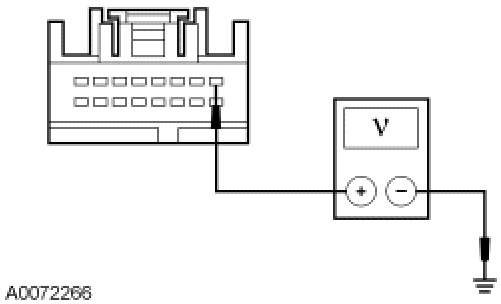

Fig. 41: Checking PAM Voltage Supply Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PAM C4014-1, circuit CBP19 (BN/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J2.

  NO : VERIFY the smart junction box (SJB) fuse 28 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

J2 CHECK THE PAM GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

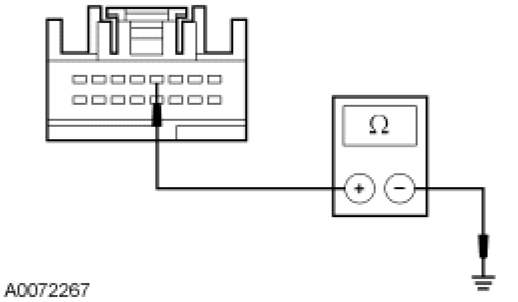

Fig. 42: Checking PAM Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-4, circuit GD171 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to J3.

  NO : REPAIR the circuit. TEST the system for normal operation.

J3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE PAM FOR AN OPEN

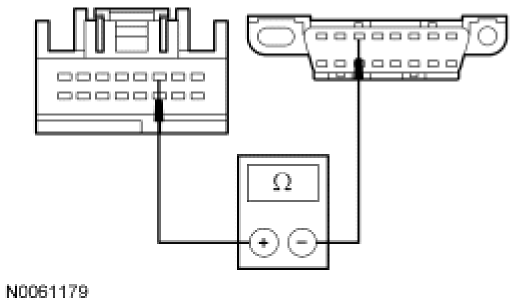

Fig. 43: Measuring Resistance Between Parking Aid Module C4014-3, Circuit VDB06 (GY/OG) & DLC C251-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-3, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

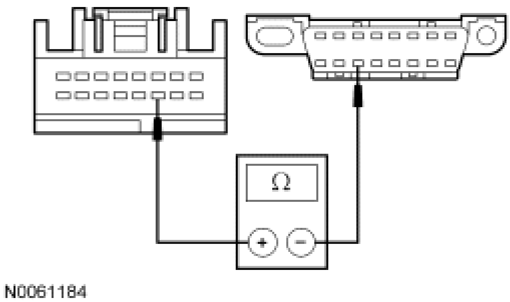

Fig. 44: Measuring Resistance Between Parking Aid Module C4014-11, Circuit VDB07 (VT/OG) & DLC C251-11
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-11, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to J4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

J4 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **PARKING AID** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test K: The Audio Control Module (ACM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Audio System/Navigation for schematic and connector information.

Normal Operation

The audio control module (ACM) communicate with the scan tool through the medium speed controller area network (MS-CAN) circuits VDB06 (GY/OG) and VDB07 (VT/OG).

Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the ACM. Voltage for the ACM is provided by circuits CBP02 (GN) and SBP11 (BU/RD). Circuit GD114 (BK/BU) provides ground.

The ACM shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ACM

PINPOINT TEST K: THE AUDIO CONTROL MODULE (ACM) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

K1 CHECK THE ACM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: ACM C290a (Base Audio/Audiophile) or C240a (THX® Audio/Navigation)
- Key in ON position.

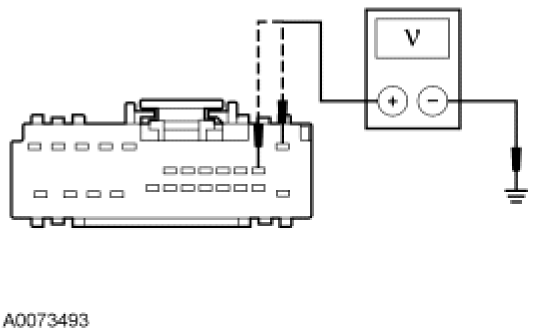

Fig. 45: Checking ACM Voltage Supply Circuits For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the base ACM C290a-1 (base audio/audiophile) or ACM C240a-1 (THX® audio/navigation), circuit SBP11 (BU/RD), harness side and ground; and between C290a-2 (base audio/audiophile) or C240a-2 (THX® audio/navigation), circuit CBP02 (GN), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to K2.

  NO : VERIFY the smart junction box (SJB) fuse 12 (7.5A) or fuse 18 (20A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

K2 CHECK THE ACM GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

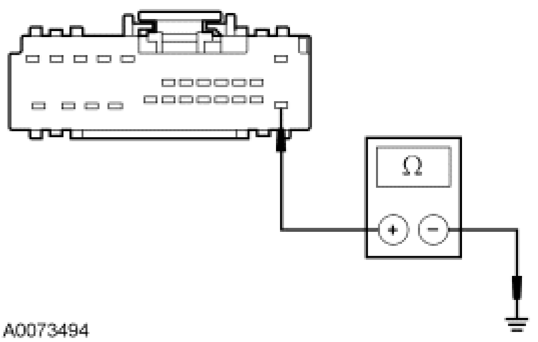

Fig. 46: Checking ACM Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the ACM C290a-13 (Base Audio/Audiophile) or the ACM C240a-13 (THX® Audio/Navigation), circuit GD114 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to K3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

K3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE ACM FOR AN OPEN

- Key in OFF position.

- Disconnect: ACM C290c (Base Audio/Audiophile) or C240c (THX® Audio/Navigation)

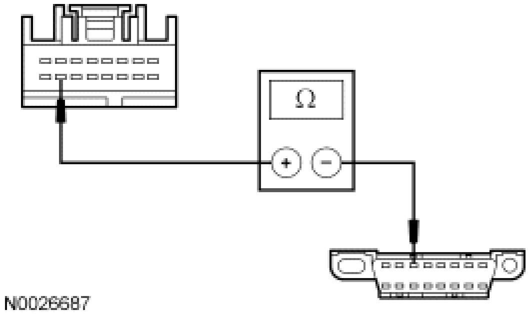

Fig. 47: Checking MS-CAN Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between C290c-15 (base audio/audiophile) or C240c-15 (THX® audio/navigation), circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

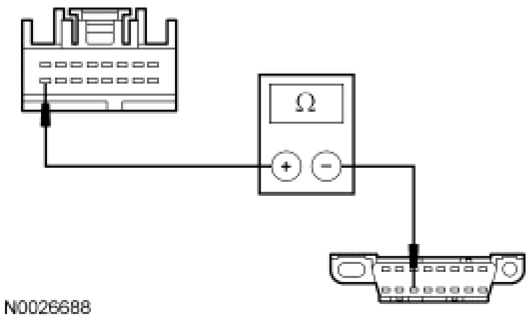

Fig. 48: Checking MS-CAN Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the base ACM C290c-16 or the audio digital signal processing (DSP) module ACM C240c-16 (THX® audio/navigation), circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to K4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

K4 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test L: The Audio Digital Signal Processing (DSP) Module Does Not Respond To The Scan Tool

Normal Operation

The audio digital signal processing (DSP) module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DSP module. Voltage for the DSP module amplifier is provided by circuits SBB20 (GN/RD) and SBB21 (GY/RD). Circuit GD148 (BK/YE) provides ground.

The DSP module shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DSP module

PINPOINT TEST L: PINPOINT TEST L: THE AUDIO DIGITAL SIGNAL PROCESSING (DSP) MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

L1 CHECK THE DSP MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: DSP Module C4326b
- Key in ON position.
- Measure the voltage between the DSP module, harness side and ground as follows:

Connector-Pin	Circuit
C4326b-9	SBB21 (GY/RD)
C4326b-10	SBB21 (GY/RD)
C4326b-11	SBB20 (GN/RD)
C4326b-12	SBB20 (GN/RD)

- **Are the voltages greater than 10 volts?**

  YES : Go to L2.

  NO : VERIFY the battery junction box (BJB) fuse 20 (20A) or fuse 21 (20A) are OK. If OK, REPAIR the circuit in question. CONNECT the PCM. CLEAR the DTCs. REPEAT the network test with the scan tool.

L2 CHECK THE DSP MODULE GROUND CIRCUITS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the DSP module amplifier, harness side and ground as follows:

Connector-Pin	Circuit
C4326b-22	GD148 (BK/YE)
C4326b-23	GD148 (BK/YE)
C4326b-24	GD148 (BK/YE)

- **Are the resistances less than 5 ohms?**

  YES : Go to L3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

L3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE DSP MODULE FOR AN OPEN

- Key in OFF position.
- Disconnect: DSP Module C4326c

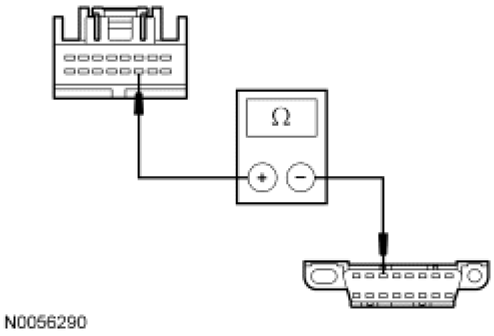

Fig. 49: Measuring Resistance Between DSP Module C4326c-11, Circuit VDB06 (GY/OG) & DLC C251-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DSP module C4326c-11, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

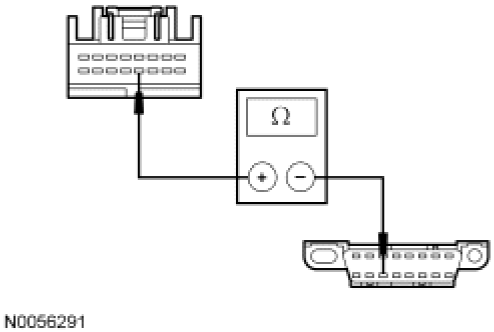

Fig. 50: Measuring Resistance Between DSP Module C4326c-12, Circuit VDB07 (VT/OG) & DLC C251-11
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DSP module C4326c-12, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to L4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

L4 CHECK FOR CORRECT DSP MODULE OPERATION

- Disconnect all the DSP module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DSP module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new DSP module. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test M: The Satellite Digital Audio Receiver System (SDARS) Module Does Not Respond To The Scan Tool

Normal Operation

The satellite digital audio receiver system (SDARS) module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the SDARS module. Voltage for the SDARS module is provided by circuit SBP15 (WH/RD). Circuit GD148 (BK/YE) provides ground.

The SDARS module shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- SDARS module

PINPOINT TEST M: THE SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS) MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

M1 CHECK THE SDARS MODULE VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: SDARS Module C4300

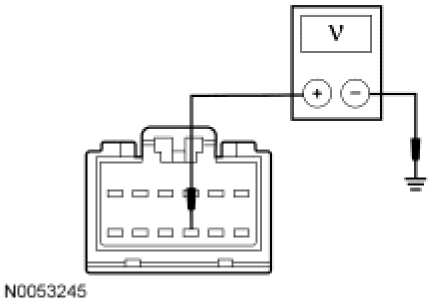

Fig. 51: Checking SDARS Module Voltage Supply Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the SDARS module C4300-9, circuit SBP15 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to M2.

  NO : VERIFY the smart junction box (SJB) fuse 20 (7.5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

M2 CHECK THE SDARS MODULE GROUND CIRCUIT FOR AN OPEN

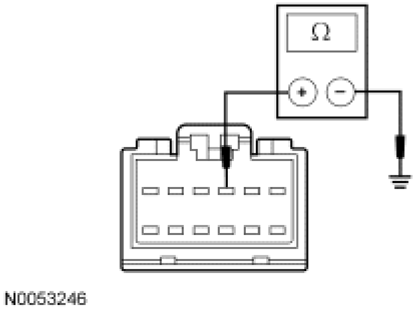

Fig. 52: Checking SDARS Module Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SDARS module C4300-3, circuit GD148 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to M3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

M3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE SDARS MODULE FOR AN OPEN

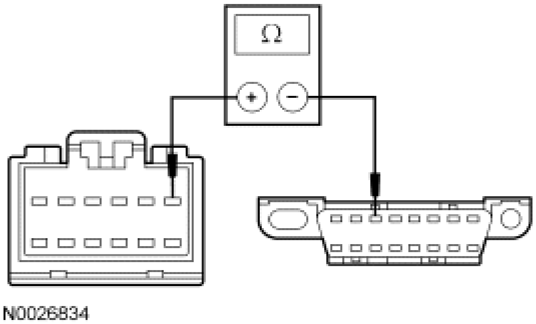

Fig. 53: Checking MS-CAN Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SDARS module C4300-1, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

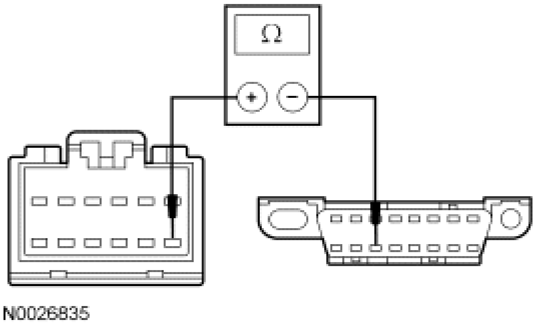

Fig. 54: Checking MS-CAN Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SDARS module C4300-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to M4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

M4 CHECK FOR CORRECT SDARS MODULE OPERATION

- Disconnect the SDARS module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the SDARS module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SDARS module. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CLEAR the DTCs. REPEAT the network test with the

scan tool.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test N: The Driver Door Module (DDM) Does Not Respond To The Scan Tool

Normal Operation

The driver door module (DDM) communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DDM. Voltage for the DDM is provided by circuit SBP15 (RD/WH). Circuit GD126 (BK/WH) provides ground.

The DDM shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DDM

PINPOINT TEST N: THE DRIVER DOOR MODULE (DDM) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

N1 CHECK THE DDM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: DDM C568b
- Key in ON position.

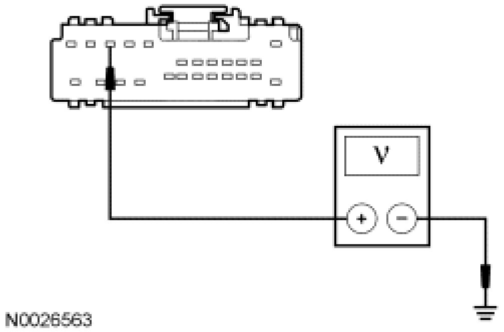

Fig. 55: Checking Circuit SBP15 (RD/WH) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DDM C568b -10, circuit SBP15 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to N2.

  NO : VERIFY the SJB fuse 20 (7.5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

N2 CHECK THE DDM GROUND CIRCUIT FOR AN OPEN

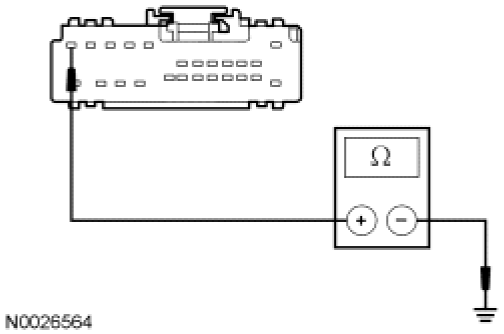

Fig. 56: Checking Circuit GD126 (BK/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DDM C568b-12, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to N3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

N3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE DDM FOR AN OPEN

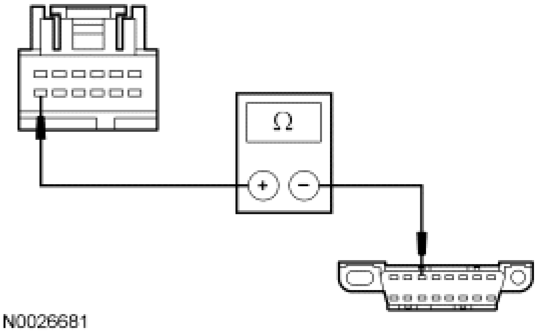

Fig. 57: Checking Medium Speed CAN Circuits Between DLC And DDM For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DDM C568a-12, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

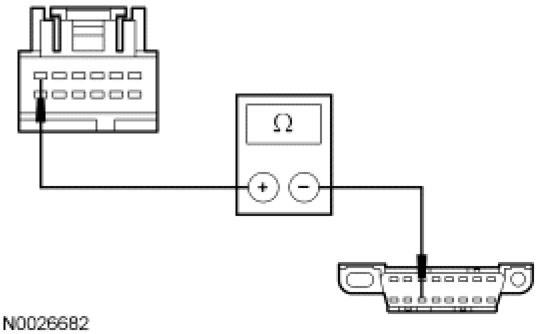

Fig. 58: Checking Medium Speed CAN Circuits Between DLC And DDM For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DDM C568a-6, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to N4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

N4 CHECK FOR CORRECT DDM OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES**

article. CLEAR the DTCs. REPEAT the network test with the scan tool.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test O: The Driver Seat Module (DSM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Memory Seats for schematic and connector information.

Normal Operation

The driver seat module (DSM) communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DSM. Voltage for the DSM is provided by circuit SBB15 (WH/RD). Circuit GD126 (BK/WH) provides ground.

The DSM shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DSM

PINPOINT TEST O: THE DRIVER SEAT MODULE (DSM) DOES NOT RESPOND TO THE SCAN TOOL

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

O1 CHECK THE VOLTAGE SUPPLY CIRCUIT SBB15 (WH/RD) FOR AN OPEN

- Key in OFF position.
- Disconnect: DSM C3299c
- Key in ON position.

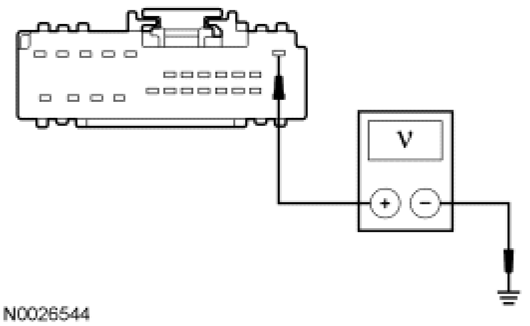

Fig. 59: Checking Voltage Supply Circuit SBB15 (WH/RD) For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DSM C3299c-1, circuit SBB15 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to O2.

  NO : VERIFY the battery junction box (BJB) fuse 15 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

O2 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Key in OFF position.

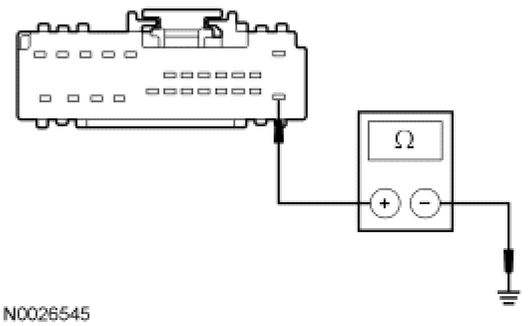

Fig. 60: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DSM C3299c-13, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

O3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE DSM FOR AN OPEN

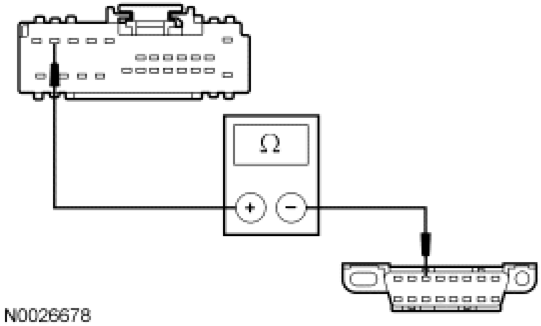

Fig. 61: Measuring Resistance Between DSM C3299C-11, Circuit VDB06 (GY/OG) & DLC C251-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DSM C3299c-11, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

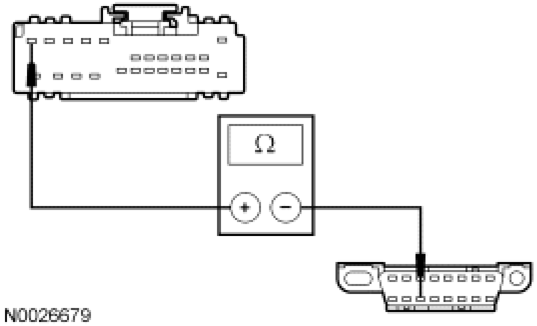

Fig. 62: Measuring Resistance Between DSM C3299C-12, Circuit VDB07 (VT/OG) & DLC C251-11
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DSM C3299c-12, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to O4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

O4 CHECK FOR CORRECT DSM OPERATION

- Disconnect all the DSM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect all the DSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test P: The Dual Climate Control Seat Module (DCSM) Does Not Respond To The Scan Tool

Normal Operation

The dual climate control seat module (DCSM) communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DCSM. Voltage for the DCSM is provided by circuits SBB11 (BU/RD) and SBB12 (GN/RD). Circuit GD139 (BK/YE) provides ground.

The DCSM shares the MS-CAN with the following modules:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DCSM

PINPOINT TEST P: PINPOINT TEST P: THE DUAL CLIMATE CONTROL SEAT MODULE (DCSM) DOES NOT RESPOND TO THE SCAN TOOL

WARNING: **Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: If a seat equipped with a supplemental restraint system (SRS) component is being serviced, the SRS must be depowered. Refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

P1 VERIFY VEHICLE EQUIPMENT - SEAT SIDE AIR BAGS

- Inspect the vehicle for seat side air bags.
- **Is the vehicle equipped with seat side air bags?**

  YES : Go to P2.

  NO : Go to P3.

P2 CHECK THE DCSM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN

- Key in OFF position.
- For vehicles with seat side air bags, carry out the following:
  - Depower the SRS. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
  - Disconnect the driver seat side air bag module C3226.
  - Connect the restraint system diagnostic tool (418-133) to the driver seat side air bag module C3226.
  - Disconnect the passenger seat side air bag module C3227.
  - Connect the restraint system diagnostic tool (418-133) to the passenger seat side air bag module C3227.
  - Connect the battery ground cable.
- Disconnect: DCSM C3305a
- Key in ON position.
- Measure the voltage between the DCSM, harness side and ground as follows:

Connector-Pin	Circuit
C3305a-E	SBB11 (BU/RD)
C3305a-F	SBB12 (GN/RD)

- **Are the voltages greater than 10 volts?**

  YES : Go to P4.

  NO : VERIFY the battery junction box (BJB) fuse 11 (30A) or fuse 12 (30A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

P3 CHECK THE DCSM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: DCSM C3305a
- Key in ON position.
- Measure the voltage between the DCSM, harness side and ground as follows:

Connector-Pin	Circuit
C3305a-E	SBB11 (BU/RD)
C3305a-F	SBB12 (GN/RD)

- **Are the voltages greater than 10 volts?**

  YES : Go to P4.

  NO : VERIFY the battery junction box (BJB) fuse 11 (30A) and fuse 12 (30A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

P4 CHECK THE DCSM GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

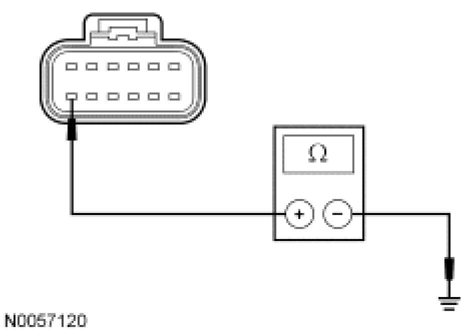

Fig. 63: Checking DCSM Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DCSM C3305a-M, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to P5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

P5 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC)

AND THE DCSM FOR AN OPEN

- Disconnect: DCSM C3305c

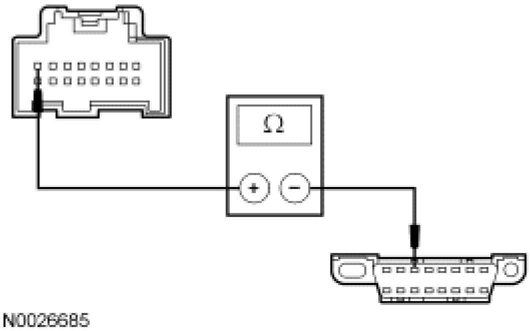

Fig. 64: Checking Medium Speed CAN Circuits Between DLC And Climate Controlled Seat Module For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DCSM C3305c-1, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

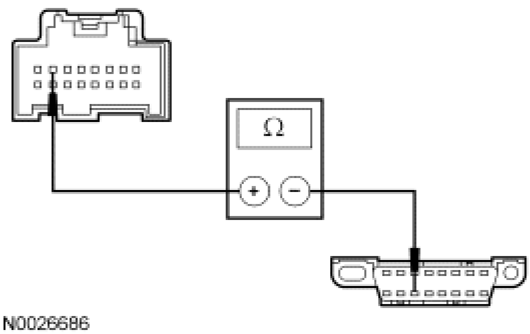

Fig. 65: Checking Medium Speed CAN Circuits Between DLC And Climate Controlled Seat Module For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DCSM C3305c-2, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to P6.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

P6 CHECK FOR CORRECT DCSM OPERATION

- Disconnect all the DCSM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect all the DCSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DCSM. REFER to **SEATING** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test Q: The Accessory Protocol Interface Module (APIM) Does Not Respond To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Normal Operation

The accessory protocol interface module (APIM) communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the HS-CAN connection to the APIM. Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the MS-CAN connection to the APIM. Voltage for the APIM is provided by circuit SBB13 (GY/RD) . Circuit GD148 (BK/YE) provides ground.

The APIM shares the HS-CAN with the PCM, the ABS module, the instrument cluster (IC), the occupant classification system module (OCSM), the transmission control module (TCM) and the restraints control module (RCM).

The APIM shares the MS-CAN with the audio control module (ACM), the parking aid module (PAM), the driver seat module (DSM), the driver door module (DDM), the dual climate control seat module (DCSM), the audio digital signal processing (DSP) module, the satellite digital audio receiver system (SDARS) module, the HVAC module, the instrument cluster (IC) and the smart junction box (SJB).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- APIM

PINPOINT TEST Q: THE ACCESSORY PROTOCOL INTERFACE MODULE (APIM) DOES NOT RESPOND TO THE SCAN TOOL

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Q1 CHECK THE APIM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

- Disconnect: APIM C3338
- Key in ON position.

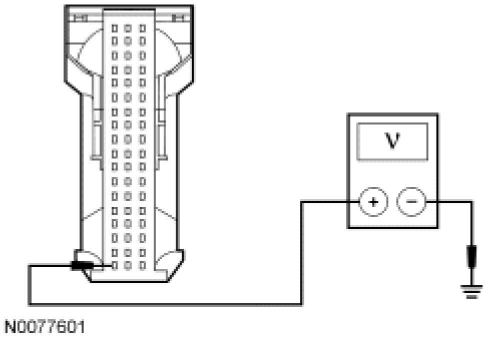

Fig. 66: Checking APIM Voltage Supply Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the APIM C3338-1, circuit SBB13 (GY/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to Q2.

NO : VERIFY the battery junction box (BJB) fuse 13 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

Q2 CHECK THE APIM GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

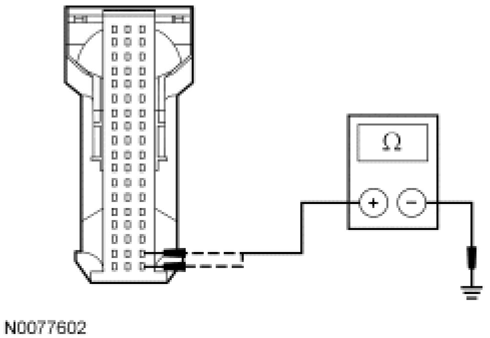

Fig. 67: Checking APIM Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the APIM C3338-37, circuit GD148 (BK/YE), harness side and ground; and between the APIM C3338-38, circuit GD148 (BK/YE), harness side and ground.
- **Are the resistances less than 5 ohms?**

YES : Go to Q3.

NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

Q3 CHECK THE HS-CAN CIRCUITS BETWEEN THE APIM AND THE DATA LINK CONNECTOR (DLC) FOR AN OPEN

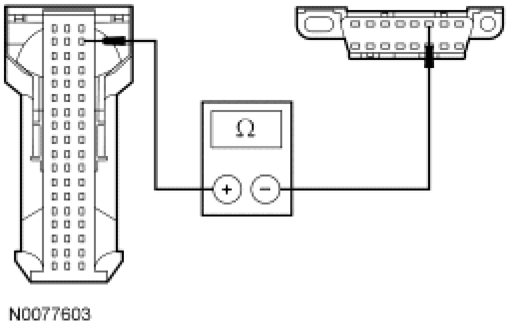

Fig. 68: Measuring Resistance Between APIM C3338-53, Circuit VDB04 (WH/BU) & DLC C251-6
Courtesy of FORD MOTOR CO.

- Measure the resistance between the APIM C3338-53, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

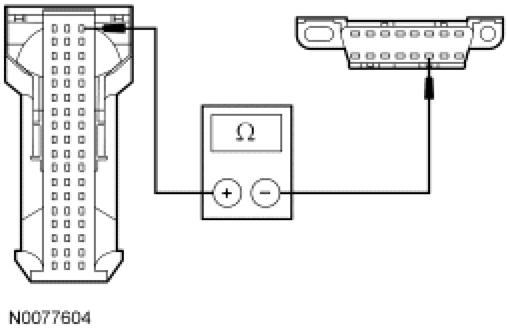

Fig. 69: Measuring Resistance Between APIM C3338-54, Circuit VDB05 (WH) & DLC C251-14
Courtesy of FORD MOTOR CO.

- Measure the resistance between the APIM C3338-54, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to Q4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

Q4 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE APIM FOR AN OPEN

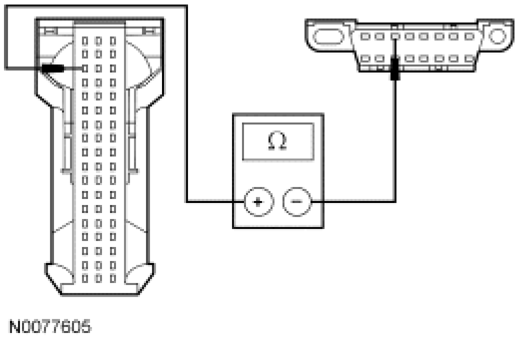

Fig. 70: Measuring Resistance Between APIM C3338-16, Circuit VDB06 (GY/OG) & DLC C251-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between the APIM C3338-16, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

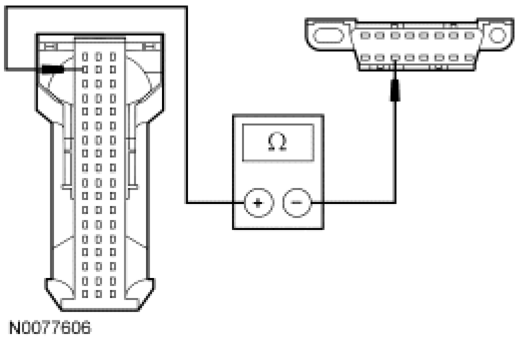

Fig. 71: Measuring Resistance Between APIM C3338-17, Circuit VDB07 (VT/OG) & DLC C251-11
Courtesy of FORD MOTOR CO.

- Measure the resistance between the APIM C3338-17, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to Q5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

Q5 CHECK FOR CORRECT APIM OPERATION

- Disconnect all the APIM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the APIM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test R: No Medium Speed Controller Area Network (MS-CAN) Communication, All Modules Are Not Responding

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Normal Operation

The MS-CAN uses an unshielded twisted pair cable, circuits VDB06 (GY/OG) and VDB07 (VT/OG).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB
- Instrument cluster (IC)
- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Parking aid module (PAM) (if equipped)
- Driver door module (DDM) (if equipped)
- Driver seat module (DSM) (if equipped)
- Dual climate control seat module (DCSM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)

PINPOINT TEST R: NO MEDIUM SPEED CONTROLLER AREA NETWORK (MS-CAN) COMMUNICATION, ALL MODULES ARE NOT RESPONDING

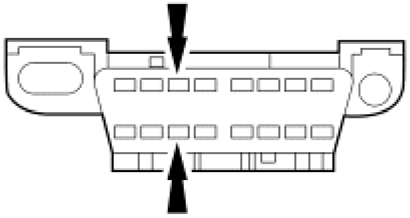
NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

R1 CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

- Key in OFF position.

- Disconnect the scan tool cable from the DLC.



N0053178

Fig. 72: Checking DLC Pins For Damage
Courtesy of FORD MOTOR CO.

- Inspect DLC pins 3 and 11 for damage.
- **Are DLC pins 3 and 11 OK?**

  YES : Go to R2.

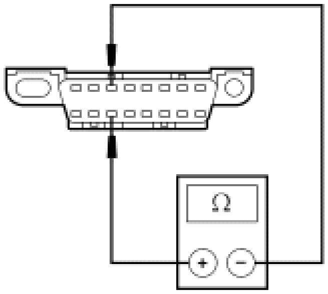
  NO : REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

R2 CHECK THE MS-CAN TERMINATION RESISTANCE

- Key in OFF position.

NOTE: Failure to disconnect the battery will result in false resistance readings.

- Disconnect the battery ground cable.



N0050701

Fig. 73: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance between 54 and 66 ohms?**

  YES : Go to R5.

NO : Go to R3.

R3 CHECK THE MS-CAN TERMINATION RESISTOR

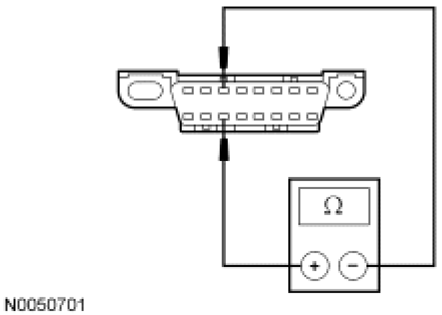


Fig. 74: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance between 108 and 132 ohms?**

YES : Go to R7.

NO : Go to R4.

R4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER

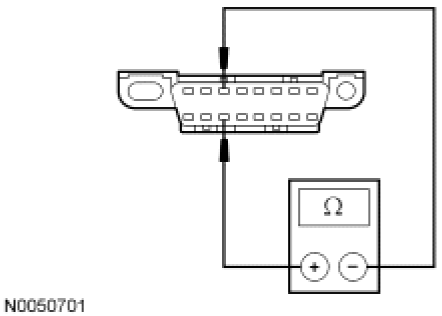

Fig. 75: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short
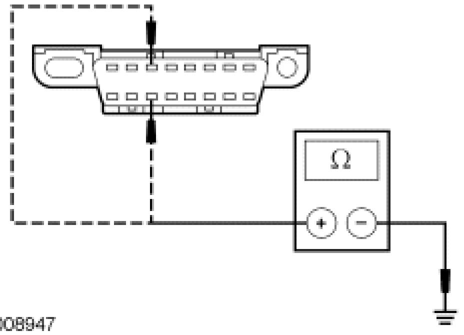
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to R9.

NO : Go to R7.

R5 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND



N0008947

Fig. 76: Checking Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

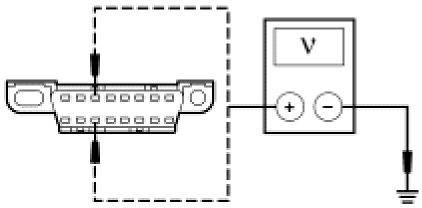
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R6.

  NO : Go to R28.

R6 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE

- Connect the battery ground cable.
- Key in ON position.



N0050702

Fig. 77: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.
- **Is the voltage greater than 6 volts?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : VERIFY all module fuses are OK. If OK, REPEAT the network test with the scan tool.

R7 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE SMART JUNCTION BOX (SJB) FOR AN OPEN

- Disconnect: SJB C2280c

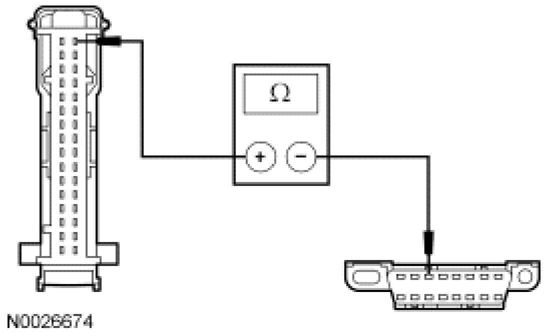


Fig. 78: Checking Medium Speed CAN Circuits Between DLC And SJB For Open (1 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-17, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

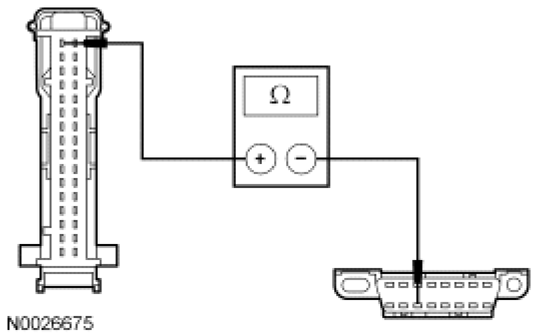

Fig. 79: Checking Medium Speed CAN Circuits Between DLC And SJB For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to R8.

  NO : REPAIR the circuit in question. CONNECT the battery ground cable. CONNECT the SJB. CLEAR the DTCs. REPEAT the network test with the scan tool.

R8 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE INSTRUMENT CLUSTER (IC) FOR AN OPEN

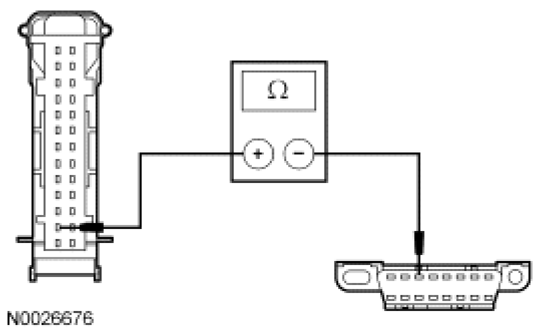

Fig. 80: Measuring Resistance Between IC C220-2, Circuit VDB06 (GY/OG) & DLC C251-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-2, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

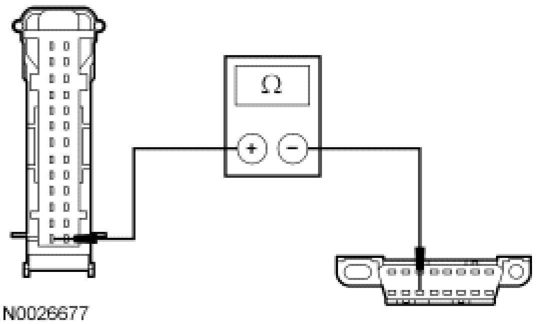

Fig. 81: Measuring Resistance Between IC C220-1, Circuit VDB07 (VT/OG) & DLC C251-11
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : VERIFY all module fuses are OK. If OK, CONNECT all modules. CONNECT the battery ground cable. REPEAT the network test with the scan tool.

  NO : REPAIR the circuit in question. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R9 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SJB DISCONNECTED

- Disconnect: SJB C2280d

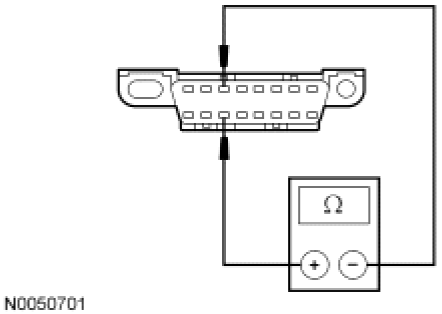

Fig. 82: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With SJB Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to R10.

  NO : Go to R47.

R10 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE IC DISCONNECTED

- Disconnect: IC C220

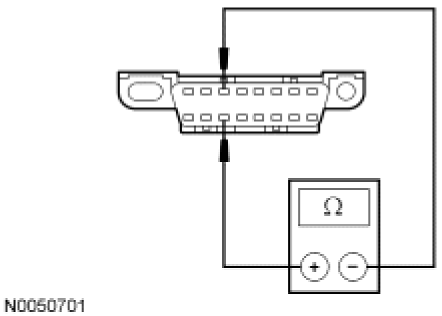

Fig. 83: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With IC Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R11.

  NO : Go to R48.

R11 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE AUDIO CONTROL MODULE (ACM) DISCONNECTED

- Disconnect: ACM C290c (Base Audio/Audiophile) or C240c (THX® Audio/Navigation)

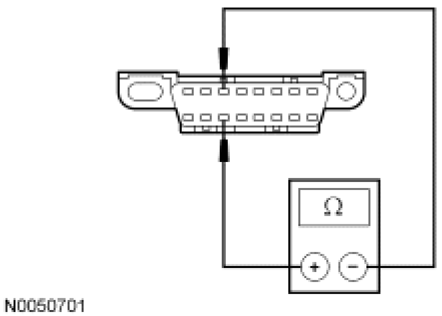

Fig. 84: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With Audio Control Module (ACM) Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the

DLC C251-11, circuit VDB07 (VT/OG), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to R12.

  NO : Go to R49.

R12 VERIFY VEHICLE EQUIPMENT - AUDIO DIGITAL SIGNAL PROCESSING (DSP) MODULE

- Inspect the vehicle for a DSP module.
- **Is the vehicle equipped with a DSP module?**

  YES : Go to R13.

  NO : Go to R14.

R13 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DSP MODULE DISCONNECTED

- Disconnect: DSP Module C4326c

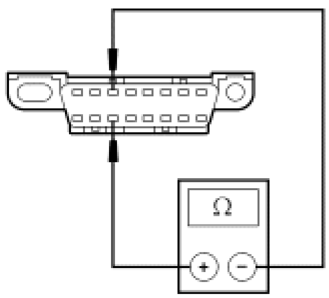

Fig. 85: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With DSP Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R14.

  NO : Go to R50.

R14 VERIFY VEHICLE EQUIPMENT - HEATING VENTILATION AIR CONDITIONING (HVAC) MODULE

- Inspect the vehicle for a HVAC module.
- **Is the vehicle equipped with a HVAC module?**

  YES : Go to R15.

  NO : Go to R16.

R15 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE HVAC MODULE DISCONNECTED

- Disconnect: HVAC Module C228a (Single-Zone) or C2356a (Dual-Zone)

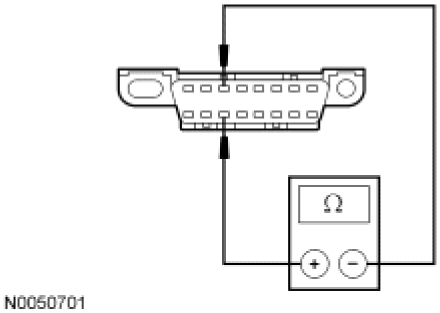

Fig. 86: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With HVAC Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R16.

  NO : Go to R51.

R16 VERIFY VEHICLE EQUIPMENT - PARKING AID MODULE (PAM)

- Inspect the vehicle for a PAM.
- **Is the vehicle equipped with a PAM?**

  YES : Go to R17.

  NO : Go to R18.

R17 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PAM DISCONNECTED

- Disconnect: PAM C4014

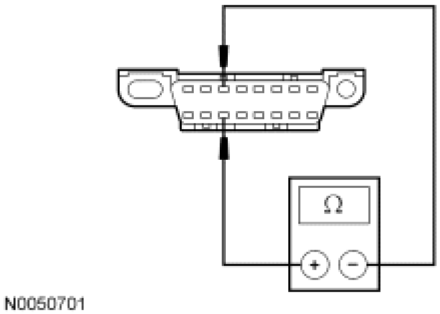

Fig. 87: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With PAM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to R18.

NO : Go to R52.

R18 VERIFY VEHICLE EQUIPMENT - DRIVER DOOR MODULE (DDM)

- Inspect the vehicle for a DDM.
- **Is the vehicle equipped with a DDM?**

YES : Go to R19.

NO : Go to R20.

R19 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DDM DISCONNECTED

- Disconnect: DDM C568a

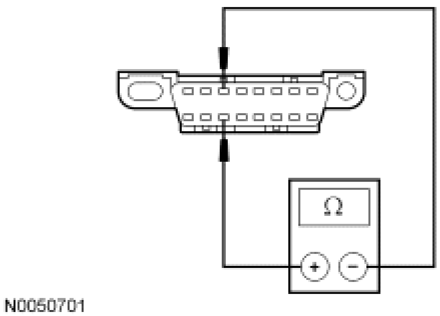

Fig. 88: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With DDM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to R20.

NO : Go to R53.

R20 VERIFY VEHICLE EQUIPMENT - DRIVER SEAT MODULE (DSM)

- Inspect the vehicle for a DSM.
- **Is the vehicle equipped with a DSM?**

YES : Go to R21.

NO : Go to R22.

R21 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DSM DISCONNECTED

- Disconnect: DSM C3299c

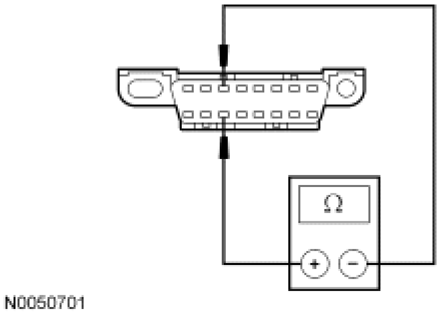

Fig. 89: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With DSM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R22.

  NO : Go to R54.

R22 VERIFY VEHICLE EQUIPMENT - DUAL CLIMATE CONTROL SEAT MODULE (DCSM)

- Inspect the vehicle for a DCSM.
- **Is the vehicle equipped with a DCSM?**

  YES : Go to R23.

  NO : Go to R24.

R23 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DCSM DISCONNECTED

- Disconnect: DCSM C3305c

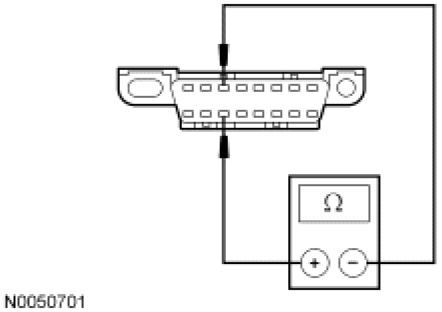

Fig. 90: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With DCSM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to R24.

  NO : Go to R55.

R24 VERIFY VEHICLE EQUIPMENT - SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS) MODULE

- Inspect the vehicle for a SDARS module.
- **Is the vehicle equipped with a SDARS module?**

  YES : Go to R25.

  NO : Go to R26.

R25 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SDARS MODULE DISCONNECTED

- Disconnect: SDARS Module C4300

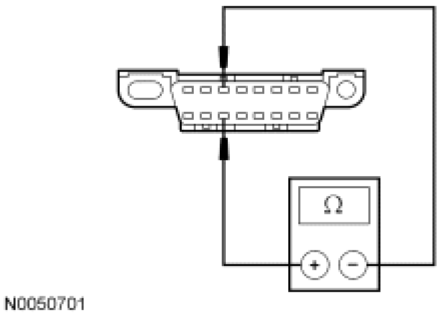

Fig. 91: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With SDARS Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R26.

  NO : Go to R56.

R26 VERIFY VEHICLE EQUIPMENT - ACCESSORY PROTOCOL INTERFACE MODULE (APIM)

- Inspect the vehicle for an APIM.
- **Is the vehicle equipped with an APIM?**

  YES : Go to R27.

  NO : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R27 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE APIM DISCONNECTED

- Disconnect: APIM C3338

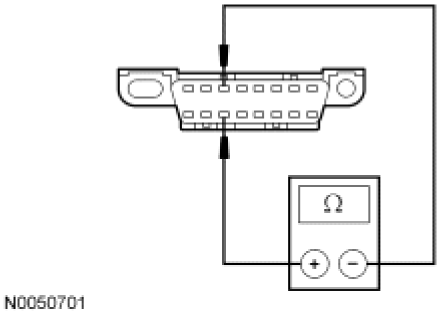

Fig. 92: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With APIM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : Go to R57.

R28 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SJB DISCONNECTED

- Disconnect: SJB C2280d

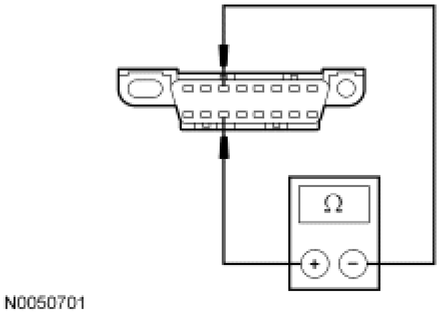

Fig. 93: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With SJB Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R47.

  NO : Go to R29.

R29 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE IC DISCONNECTED

- Disconnect: IC C220

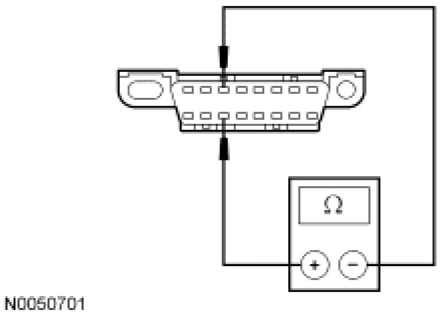

Fig. 94: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With IC Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R48.

  NO : Go to R30.

R30 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ACM DISCONNECTED

- Disconnect: ACM C290c (Base Audio/Audiophile) or C240c (THX® Audio/Navigation)

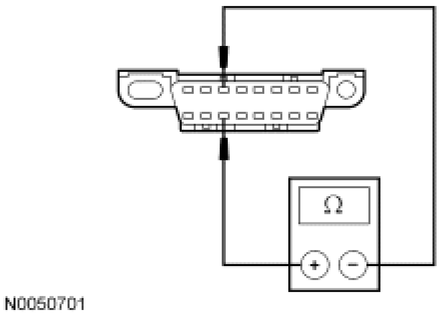

Fig. 95: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With ACM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R49.

  NO : Go to R31.

R31 VERIFY VEHICLE EQUIPMENT - DSP MODULE

- Inspect the vehicle for a DSP module.
- **Is the vehicle equipped with a DSP module?**

  YES : Go to R32.

  NO : Go to R33.

R32 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DSP MODULE DISCONNECTED

- Disconnect: DSP Module C4326c

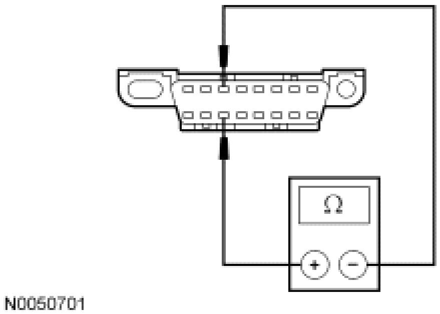

Fig. 96: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With DSP Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R50.

  NO : Go to R33.

R33 VERIFY VEHICLE EQUIPMENT - HVAC MODULE

- Inspect the vehicle for an HVAC module.
- **Is the vehicle equipped with an HVAC module?**

  YES : Go to R34.

  NO : Go to R35.

R34 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE HVAC MODULE DISCONNECTED

- Disconnect: HVAC Module C228a (Single-Zone) or C2356a (Dual-Zone)

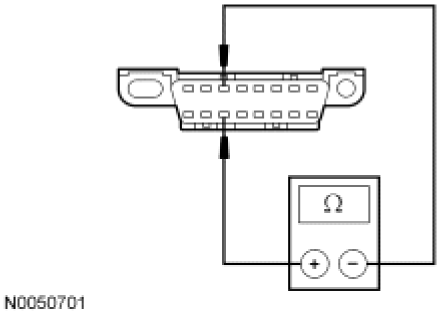

Fig. 97: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With HVAC Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R51.

  NO : Go to R35.

R35 VERIFY VEHICLE EQUIPMENT - PAM

- Inspect the vehicle for a PAM.
- **Is the vehicle equipped with a PAM?**

  YES : Go to R36.

  NO : Go to R37.

R36 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PAM DISCONNECTED

- Disconnect: PAM C4014

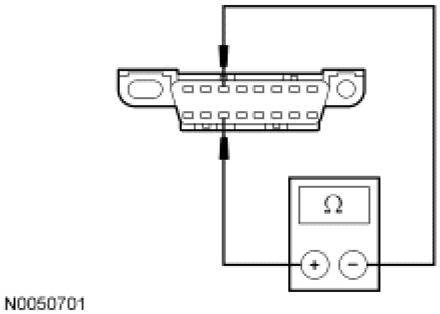

Fig. 98: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With PAM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

YES : Go to R52.

NO : Go to R37.

R37 VERIFY VEHICLE EQUIPMENT - DDM

- Inspect the vehicle for a DDM.
- **Is the vehicle equipped with a DDM?**

YES : Go to R38.

NO : Go to R39.

R38 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DDM DISCONNECTED

- Disconnect: DDM C568a

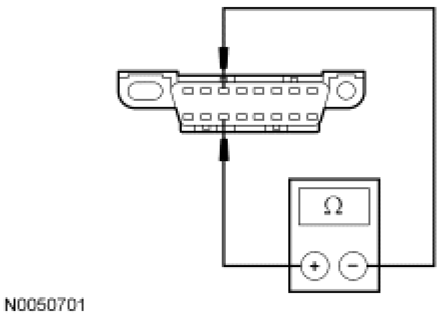

Fig. 99: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With DDM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

YES : Go to R53.

NO : Go to R39.

R39 VERIFY VEHICLE EQUIPMENT - DSM

- Inspect the vehicle for a DSM.
- **Is the vehicle equipped with a DSM?**

YES : Go to R40.

NO : Go to R41.

R40 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DSM DISCONNECTED

- Disconnect: DSM C3299c

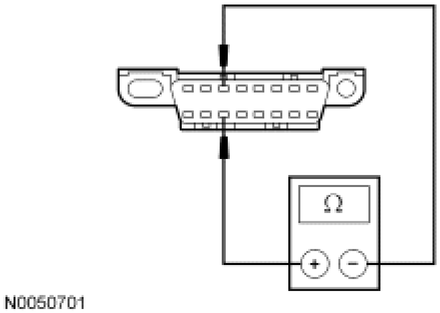

Fig. 100: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With DSM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R54.

  NO : Go to R41.

R41 VERIFY VEHICLE EQUIPMENT - DUAL CLIMATE CONTROL SEAT MODULE (DCSM)

- Inspect the vehicle for a DCSM.
- **Is the vehicle equipped with a DCSM?**

  YES : Go to R42.

  NO : Go to R43.

R42 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DCSM DISCONNECTED

- Disconnect: DCSM C3305c

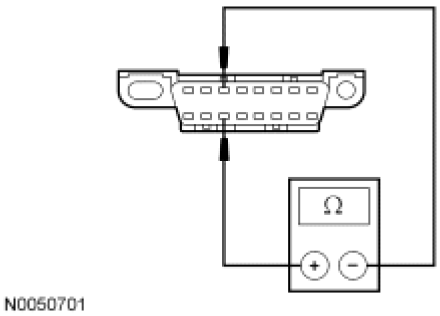

Fig. 101: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With DCSM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R55.

  NO : Go to R43.

R43 VERIFY VEHICLE EQUIPMENT - SDARS MODULE

- Inspect the vehicle for a SDARS module.
- **Is the vehicle equipped with a SDARS module?**

  YES : Go to R44.

  NO : Go to R45.

R44 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SDARS MODULE DISCONNECTED

- Disconnect: SDARS Module C4300

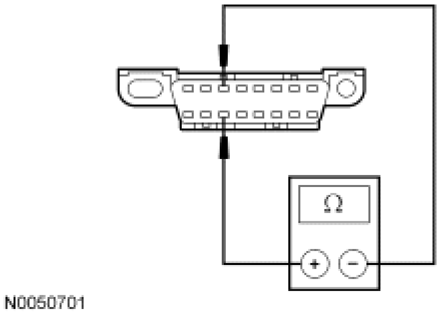

Fig. 102: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With SDARS Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R56.

  NO : Go to R45.

R45 VERIFY VEHICLE EQUIPMENT - APIM

- Inspect the vehicle for an APIM.
- **Is the vehicle equipped with an APIM?**

  YES : Go to R46.

  NO : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R46 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE APIM DISCONNECTED

- Disconnect: APIM C3338

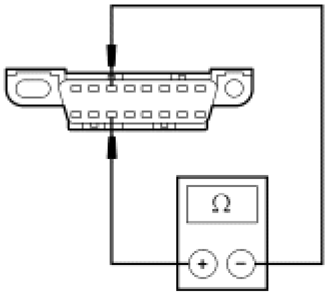

Fig. 103: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Ground With APIM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to R57.

  NO : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R47 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R48 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R49 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ACM. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R50 CHECK FOR CORRECT DSP MODULE OPERATION

- Disconnect all the DSP module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DSP module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSP module. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

R51 CHECK FOR CORRECT HEATING VENTILATION AIR CONDITIONING (HVAC) MODULE OPERATION

- Disconnect all the HVAC module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the HVAC module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R52 CHECK FOR CORRECT PAM OPERATION

- Disconnect all the PAM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PAM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **PARKING AID** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

R53 CHECK FOR CORRECT DDM OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT

the network test with the scan tool.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R54 CHECK FOR CORRECT DSM OPERATION

- Disconnect all the DSM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R55 CHECK FOR CORRECT DCSM OPERATION

- Disconnect all the DCSM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DCSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DCSM. REFER to **SEATING** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

R56 CHECK FOR CORRECT SDARS MODULE OPERATION

- Disconnect the SDARS module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins

- Connect the SDARS module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SDARS module. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

R57 CHECK FOR CORRECT APIM OPERATION

- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new APIM. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test S: Intermittent No Medium Speed Controller Area Network (MS-CAN) Communication, One Or More Modules Are Not Responding During Network Test

Normal Operation

The MS-CAN uses an unshielded twisted pair cable, circuits VDB06 (GY/OG) and VDB07 (VT/OG).

The following modules communicate on the MS-CAN:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate controlled seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)

- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

In the event that one of the 2 network circuits (HS-CAN + or HS-CAN -) becomes open to a module on the network, unreliable network communication to all modules on the network may result.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

PINPOINT TEST S: INTERMITTENT NO MEDIUM SPEED CONTROLLER AREA NETWORK (MS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

NOTE: **Various modules will set network DTCs during this test procedure. Clear the DTCs from all modules after the diagnostic procedure is complete.**

S1 CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE

- Key in OFF position.
- Disconnect the scan tool cable from the DLC.

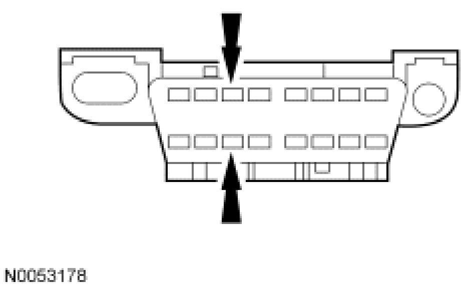

Fig. 104: Checking DLC Pins For Damage
Courtesy of FORD MOTOR CO.

- Inspect DLC pins 3 and 11 for damage.
- **Are DLC pins 3 and 11 OK?**

  YES : Go to S2.

  NO : REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

S2 CHECK THE MS-CAN TERMINATION RESISTANCE

NOTE: **Failure to disconnect the battery will result in false resistance readings.**

- Disconnect the battery ground cable.

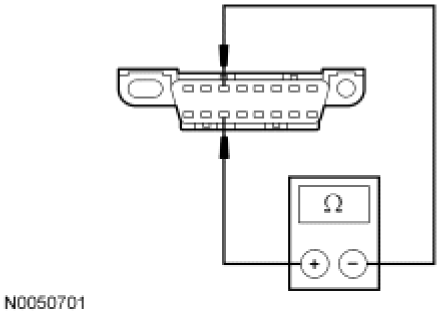

Fig. 105: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance between 54 and 66 ohms?**

  YES : Go to S3.

  NO : Go to **Pinpoint Test Q**.

S3 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND

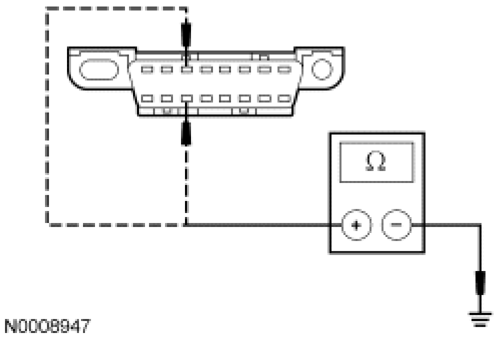

Fig. 106: Checking Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to S4.

  NO : Go to **Pinpoint Test Q**.

S4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE

- Connect the battery ground cable.
- Key in ON position.

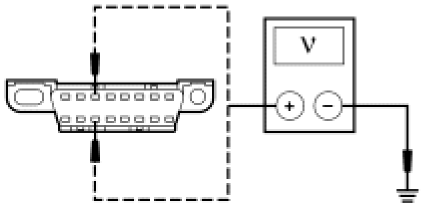

Fig. 107: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.
- **Is the voltage greater than 6 volts?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : Go to S5.

S5 VERIFY VEHICLE EQUIPMENT - DRIVER SEAT MODULE (DSM)

- Inspect the vehicle for a DSM.
- **Is the vehicle equipped with a DSM?**

  YES : Go to S6.

  NO : Go to S7.

S6 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DSM DISABLED

NOTE:	When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: BJB Fuse 15 (10A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. Go to **Pinpoint Test O**.

  NO : INSTALL the removed fuse. Go to S7.

S7 VERIFY VEHICLE EQUIPMENT - DRIVER DOOR MODULE (DDM) AND/OR SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS) MODULE

- Inspect the vehicle for a DDM and/or SDARS module.
- **Is the vehicle equipped with a DDM, SDARS module, or both?**

  YES : Go to S8.

  NO : Go to S10.

S8 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DDM AND/OR

SDARS MODULE DISABLED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: SJB Fuse 20 (7.5A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. For vehicles equipped with BOTH a DDM and SDARS module, go to S9.

  For vehicles equipped with a DDM only, go to **Pinpoint Test N**.

  For vehicles equipped with a SDARS module only, go to **Pinpoint Test M**.

  NO : INSTALL the removed fuse. Go to S10.

S9 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DDM DISCONNECTED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: DDM C568b
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : CONNECT the DDM. Go to **Pinpoint Test N**.

  NO : CONNECT the DDM. Go to **Pinpoint Test M**.

S10 VERIFY VEHICLE EQUIPMENT - HVAC MODULE

- Inspect the vehicle for a HVAC module.
- **Is the vehicle equipped with a HVAC module?**

  YES : Go to S11.

  NO : Go to S13.

S11 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE HVAC MODULE DISABLED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: SJB Fuse 13 (10A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. Go to **Pinpoint Test I**.

  NO : Go to S12.

S12 VERIFY VEHICLE EQUIPMENT - ACCESSORY PROTOCOL INTERFACE MODULE (APIM)

- Inspect the vehicle for an APIM.
- **Is the vehicle equipped with an APIM?**

  YES : Go to S13.

  NO : Go to S14.

S13 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISCONNECTED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: Battery Junction Box (BJB) Fuse 13 (10A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : Go to S14.

  NO : CONNECT the APIM. Go to **Pinpoint Test Q**.

S14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE INSTRUMENT CLUSTER (IC) DISCONNECTED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: IC C220
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : CONNECT the IC. Go to **Pinpoint Test G**.

  NO : Go to S15.

S15 VERIFY VEHICLE EQUIPMENT - DUAL CLIMATE CONTROLLED SEAT MODULE (DCSM)

- Inspect the vehicle for a DCSM.
- **Is the vehicle equipped with a DCSM?**

  YES : Go to S16.

  NO : Go to S17.

S16 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DCSM DISABLED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: BJB Fuses 11 (30A) and 12 (30A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuses. Go to **Pinpoint Test P**.

  NO : Go to S17.

S17 VERIFY VEHICLE EQUIPMENT - AUDIO DIGITAL SIGNAL PROCESSING (DSP) MODULE

- Inspect the vehicle for an audio DSP module.
- **Is the vehicle equipped with an audio DSP module?**

  YES : Go to S17.

  NO : Go to S18.

S18 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE AUDIO DSP MODULE DISABLED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: BJB Fuses 20 (20A) and 21 (20A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuses. Go to **Pinpoint Test L**.

  NO : Go to S19.

S19 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE SJB DISABLED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: BJB Fuse 19 (40A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. Go to **Pinpoint Test H**.

  NO : Go to S20.

S20 VERIFY VEHICLE EQUIPMENT - PARKING AID MODULE (PAM) AND/OR 4X4 CONTROL MODULE

- Inspect the vehicle for a PAM and/or 4X4 control module.
- **Is the vehicle equipped with a PAM and/or 4X4 control module?**

  YES : Go to S21.

  NO : Go to S23.

S21 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE PAM AND/OR 4X4 CONTROL MODULE DISABLED

NOTE:	**When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: SJB Fuse 28 (10A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. For vehicles equipped with BOTH a PAM and 4X4 control module, go to S22.

  For vehicles equipped with a PAM only, go to **Pinpoint Test J**.

  For vehicles equipped with a 4X4 control module only, go to **Pinpoint Test E**.

  NO : Go to S22.

S22 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE 4X4 CONTROL MODULE DISCONNECTED

NOTE:	**When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: 4X4 Control Module C3253
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

YES : CONNECT the 4X4 control module. Go to **Pinpoint Test E**.

NO : CONNECT the 4X4 control module. Go to **Pinpoint Test J**.

S23 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE AUDIO CONTROL MODULE (ACM) DISABLED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: SJB Fuse 12 (7.5A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. Go to **Pinpoint Test K**.

  NO : INSTALL the removed fuse. Go to S24.

S24 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ACM DISCONNECTED

NOTE: **When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: ACM C240c (Base Audio/Audiophile) or C290c (THX® Audio/Navigation)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : CONNECT the ACM. Go to **Pinpoint Test K**.

  NO : CONNECT the ACM. An intermittent fault is not present. Go to **Pinpoint Test Q**.

Pinpoint Test T: No High Speed Controller Area Network (HS-CAN) Communication, All Modules Are Not Responding

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Normal Operation

The HS-CAN uses an unshielded twisted pair cable, circuits VDB04 (WH/BU) and VDB05 (WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM

- ABS module
- Accessory protocol interface module (APIM) (if equipped)
- Transmission control module (TCM)
- 4X4 control module (if equipped)
- Instrument cluster (IC)
- Occupant classification system module (OCSM)
- Restraints control module (RCM)

PINPOINT TEST T: NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ALL MODULES ARE NOT RESPONDING

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

T1 CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

- Key in OFF position.
- Disconnect the scan tool cable from the DLC.

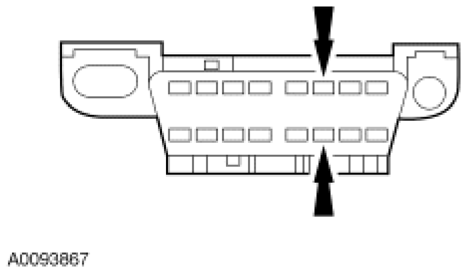

Fig. 108: Checking Data Link Connector (DLC) Pins For Damage
Courtesy of FORD MOTOR CO.

- Inspect DLC pins 6 and 14 for damage.
- **Are DLC pins 6 and 14 OK?**

  YES : Go to T2.

  NO : REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

T2 CHECK THE HS-CAN TERMINATION RESISTANCE

- Key in OFF position.

NOTE: Failure to disconnect the battery will result in false resistance readings.

- Disconnect the battery ground cable.

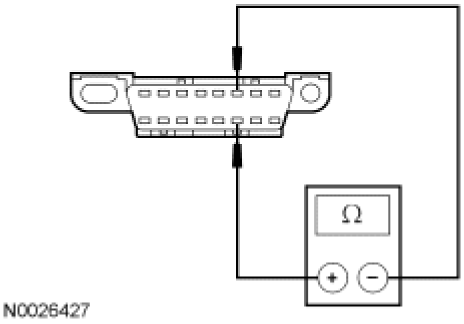

Fig. 109: Checking HS-CAN Termination Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance between 54 and 66 ohms?**

  YES : Go to T3.

  NO : Go to T5.

T3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND

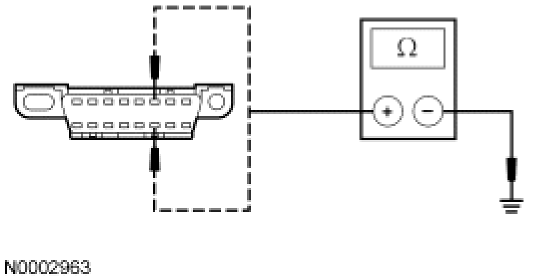

Fig. 110: Checking Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T4.

  NO : Go to T21.

T4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE

- Connect the battery ground cable.

- Key in ON position.

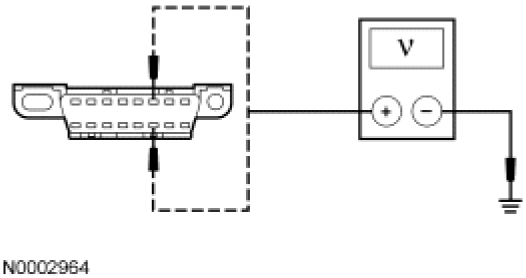

Fig. 111: Checking HS-CAN Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Is the voltage greater than 6 volts?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The CAN has tested within specifications. VERIFY the scan tool operation on a substitute vehicle, and REPEAT the network test on the suspect vehicle.

T5 CHECK THE HS-CAN TERMINATION RESISTOR

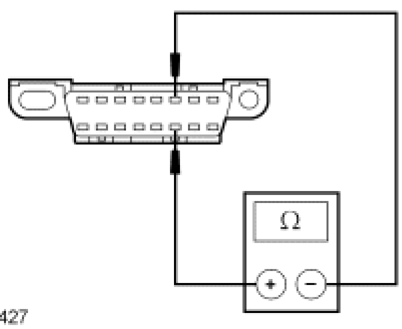

Fig. 112: Checking HS-CAN Termination Resistor
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance between 108 and 132 ohms?**

  YES : Go to T6.

  NO : Go to T9.

T6 CHECK THE HS-CAN TERMINATION RESISTOR WITH THE PCM DISCONNECTED

- Disconnect: PCM C175b

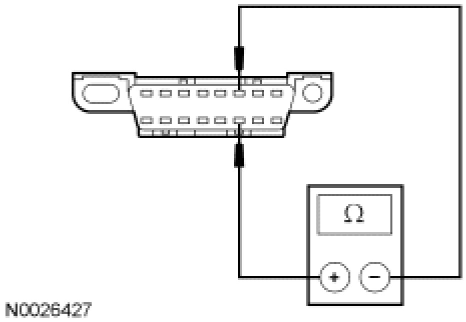

Fig. 113: Checking HS-CAN Termination Resistor With PCM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance between 108 and 132 ohms?**

  YES : Go to T7.

  NO : Go to T8.

T7 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN

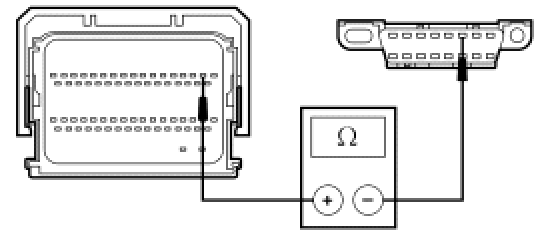

Fig. 114: Checking HS-CAN (+) Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

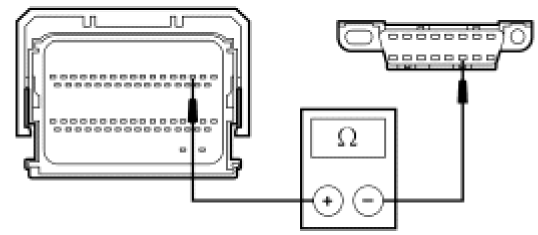

Fig. 115: Checking HS-CAN (-) Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to T31.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

T8 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE INSTRUMENT CLUSTER (IC) FOR AN OPEN

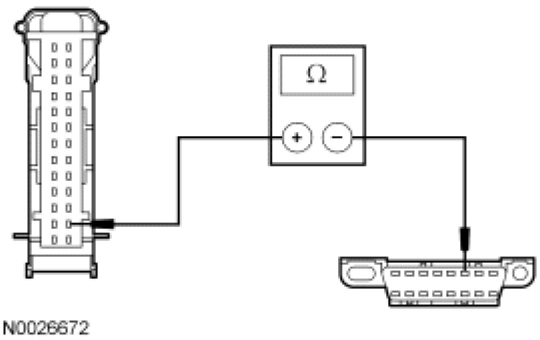

Fig. 116: Measuring Resistance Between IC C220-15, Circuit VDB04 (WH/BU) & DLC C251-6
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-15, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.

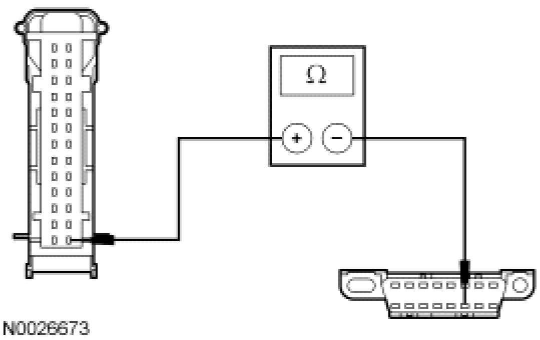

Fig. 117: Measuring Resistance Between IC C220-14, Circuit VDB05 (WH) & DLC C251-14
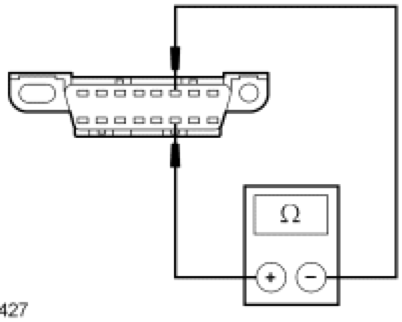
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-14, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to T35.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

T9 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER



N0026427

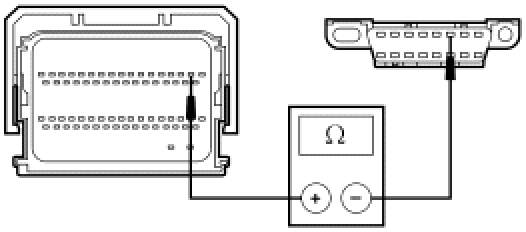
Fig. 118: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T11.

  NO : Go to T10.

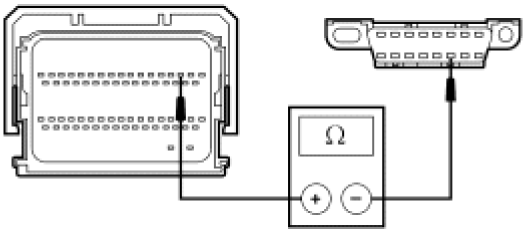
T10 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN



N0026577

Fig. 119: Checking HS-CAN (+) Circuit
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.



N0026578

Fig. 120: Checking HS-CAN (-) Circuit
Courtesy of FORD MOTOR CO.

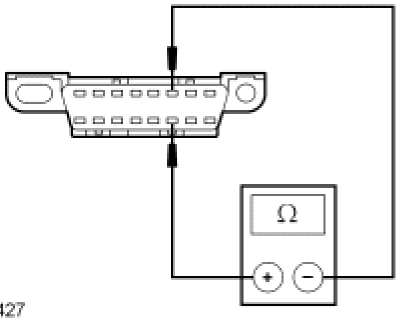
- Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : The CAN has tested within specifications. VERIFY the scan tool operation on a substitute vehicle, and REPEAT the network test on the suspect vehicle.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

T11 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PCM DISCONNECTED

- Disconnect: PCM C175b



N0026427

Fig. 121: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With PCM Disconnected
Courtesy of FORD MOTOR CO.

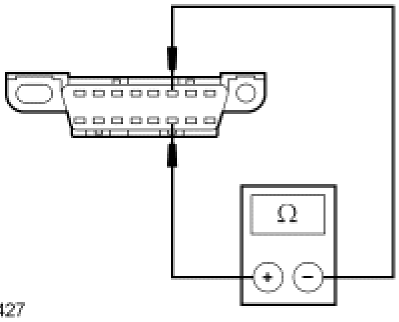
- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T12.

  NO : Go to T31.

T12 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ABS MODULE DISCONNECTED

- Disconnect: ABS Module C135



N0026427

Fig. 122: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With ABS

Module Disconnected
Courtesy of FORD MOTOR CO.

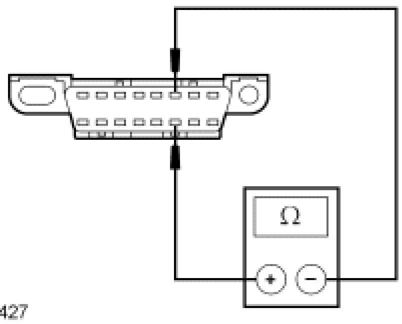
- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T13.

  NO : Go to T32.

T13 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE TRANSMISSION CONTROL MODULE (TCM) DISCONNECTED

- Disconnect: TCM C2352b (FNR5 Transaxle)
- Disconnect: TCM C1533 (6-Speed Transaxle)



N0026427

Fig. 123: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With Transmission Control Module (TCM) Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T14.

  NO : Go to T33.

T14 VERIFY VEHICLE EQUIPMENT - 4X4 CONTROL MODULE

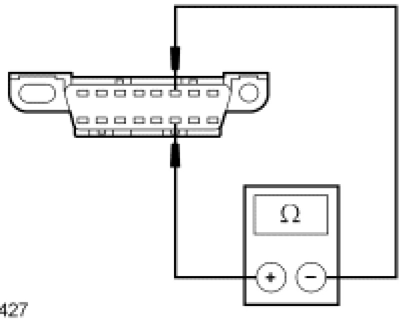
- Inspect the vehicle for a 4X4 control module.
- **Is the vehicle equipped with a 4X4 control module?**

  YES : Go to T15.

  NO : Go to T16.

T15 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE 4X4 CONTROL MODULE DISCONNECTED

- Disconnect: 4X4 Control Module C3253



N0026427

Fig. 124: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With 4X4 Control Module Disconnected
Courtesy of FORD MOTOR CO.

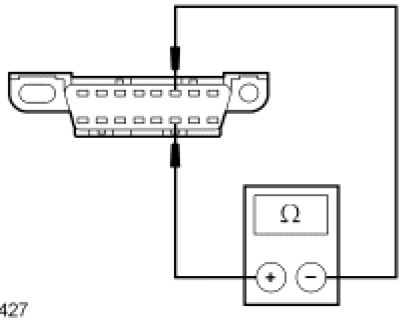
- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T16.

  NO : Go to T34.

T16 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE INSTRUMENT CLUSTER (IC) DISCONNECTED

- Disconnect: IC C220



N0026427

Fig. 125: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With Instrument Cluster (IC) Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T17.

  NO : Go to T35.

T17 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DISCONNECTED

- Disconnect: OCSM C3159

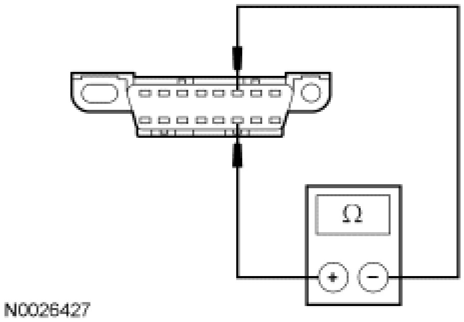


Fig. 126: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With Occupant Classification System Module (OCSM) Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T18.

  NO : Go to T36.

T18 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE RESTRAINTS CONTROL MODULE (RCM) DISCONNECTED

- Disconnect: RCM C310b

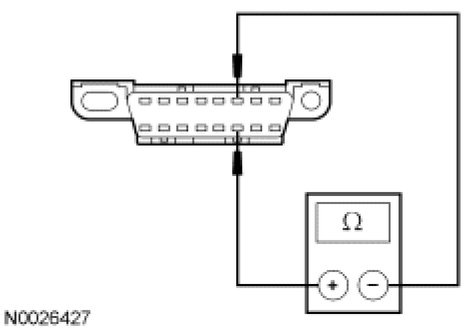

Fig. 127: Checking HS-CAN (+) & HS-CAN (-) Circuits For A Short Together With Restraints Control Module (RCM) Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T19.

  NO : Go to T37.

T19 VERIFY VEHICLE EQUIPMENT - ACCESSORY PROTOCOL INTERFACE MODULE (APIM)

- Inspect the vehicle for an APIM.

- **Is the vehicle equipped with an APIM?**

  YES : Go to T20.

  NO : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T20 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE APIM DISCONNECTED

- Disconnect: APIM C3338

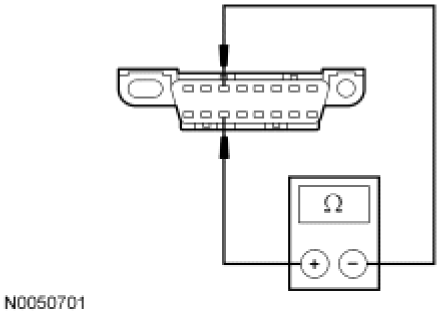

Fig. 128: Checking MS-CAN (+) & MS-CAN (-) Circuits For A Short Together With APIM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : Go to T38.

T21 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PCM DISCONNECTED

- Disconnect: PCM C175b

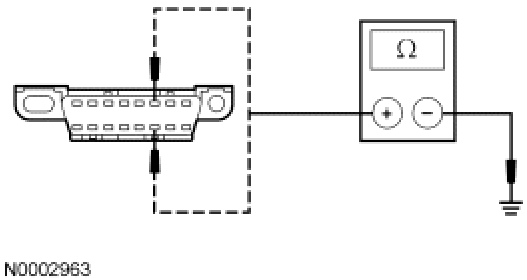

Fig. 129: Checking Circuits For A Short To Ground With PCM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T31.

  NO : Go to T22.

T22 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ABS MODULE DISCONNECTED

- Disconnect: ABS Module C135

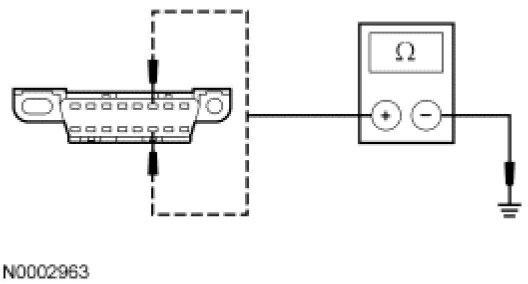

Fig. 130: Checking Circuits For A Short To Ground With ABS Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T32.

  NO : Go to T23.

T23 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE TCM DISCONNECTED

- Disconnect: TCM C2352b (FNR5 Transaxle)
- Disconnect: TCM C1533 (6-Speed Transaxle)

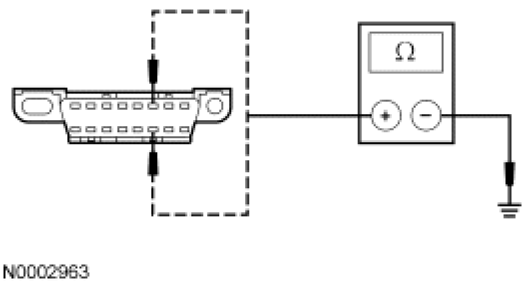

Fig. 131: Checking Circuits For A Short To Ground With TCM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T33.

  NO : Go to T24.

T24 VERIFY VEHICLE EQUIPMENT - 4X4 CONTROL MODULE

- Inspect the vehicle for a 4X4 control module.
- **Is the vehicle equipped with a 4X4 control module?**

  YES : Go to T25.

  NO : Go to T26.

T25 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE 4X4 CONTROL MODULE DISCONNECTED

- Disconnect: 4X4 Control Module C3253

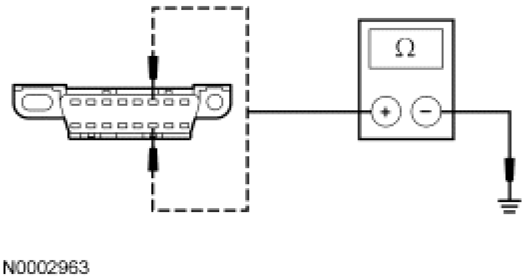

Fig. 132: Checking Circuits For A Short To Ground With 4X4 Control Module Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T34.

  NO : Go to T26.

T26 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE IC DISCONNECTED

- Disconnect: IC C220

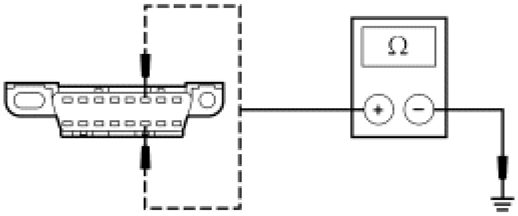

Fig. 133: Checking Circuits For A Short To Ground With IC Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T35.

  NO : Go to T27.

T27 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE OCSM DISCONNECTED

- Disconnect: OCSM C3159

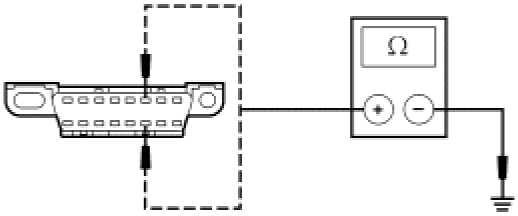

Fig. 134: Checking Circuits For A Short To Ground With OCSM Disconnected
Courtesy of FORD MOTOR CO.

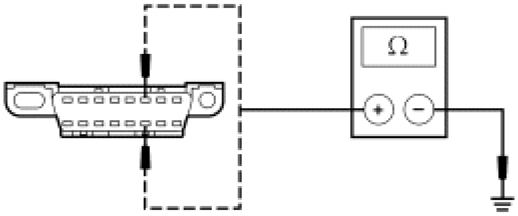
- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T36.

  NO : Go to T28.

T28 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE RCM DISCONNECTED

- Disconnect: RCM C310b



N0002963

Fig. 135: Checking Circuits For A Short To Ground With RCM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T37.

  NO : Go to T29.

T29 VERIFY VEHICLE EQUIPMENT - APIM

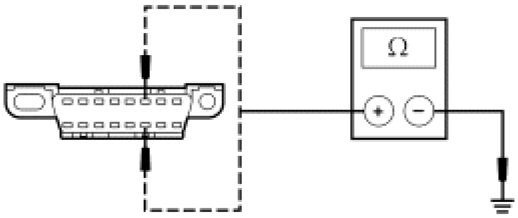
- Inspect the vehicle for an APIM.
- **Is the vehicle equipped with an APIM?**

  YES : Go to T30.

  NO : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T30 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE APIM DISCONNECTED

- Disconnect: APIM C3338



N0002963

Fig. 136: Checking Circuits For A Short To Ground With APIM Disconnected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to T38.

NO : REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T31 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T32 CHECK FOR CORRECT ABS MODULE OPERATION

- Disconnect the ABS module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the ABS module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **VEHICLE DYNAMIC SYSTEMS** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T33 CHECK FOR CORRECT TCM OPERATION

- Disconnect the TCM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the TCM connector and make sure it seats correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new TCM. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T34 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect the 4X4 control module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the 4X4 control module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T35 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T36 CHECK FOR CORRECT OCSM OPERATION

- Disconnect the OCSM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the OCSM connector and make sure it seats correctly.
- Verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new OCSM. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CONNECT the modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. CONNECT all modules. CONNECT the battery ground cable. The concern may have been caused by a loose or corroded connector. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the network test with the scan tool.

T37 CHECK FOR CORRECT RCM OPERATION

- Disconnect all the RCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the RCM connectors and make sure they seat correctly.
- Verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new RCM. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

T38 CHECK FOR CORRECT APIM OPERATION

- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new APIM. REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test U: Intermittent No High Speed Controller Area Network (HS-CAN) Communication, One Or More Modules Are Not Responding During Network Test

Normal Operation

An open circuit VDB04 (WH/BU) (HS-CAN +) or VDB05 (WH) (HS-CAN -) may cause intermittent or unreliable communication to all modules on the HS-CAN. In the event that one of the 2 network circuits (HS-CAN + or HS-CAN -) becomes open to a module on the network, unreliable network communication to all modules on the network may result.

The following modules communicate on the HS-CAN:

- Accessory protocol interface module (APIM) (if equipped)
- Audio control module (ACM)
- Audio digital signal processing (DSP) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Driver door module (DDM) (if equipped)
- Dual climate controlled seat module (DCSM) (if equipped)
- Heating ventilation air conditioning (HVAC) module (if equipped)
- Instrument cluster (IC)
- Parking aid module (PAM) (if equipped)
- Satellite digital audio receiver system (SDARS) module (if equipped)
- Smart junction box (SJB)

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

PINPOINT TEST U: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

NOTE: Various modules will set network DTCs during this test procedure. Clear the DTCs from all modules after the diagnostic procedure is complete.

U1 CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE

- Key in OFF position.
- Disconnect the scan tool cable from the DLC.

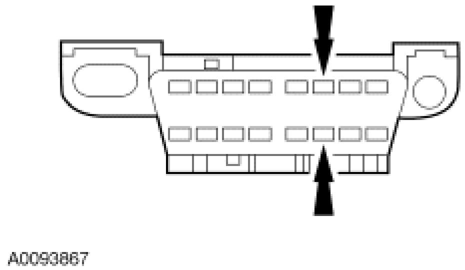


Fig. 137: Checking Data Link Connector (DLC) Pins For Damage
Courtesy of FORD MOTOR CO.

- Inspect DLC pins 6 and 14 for damage.
- **Are DLC pins 6 and 14 OK?**

  YES : Go to U2.

  NO : REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

U2 CHECK THE HS-CAN TERMINATION RESISTANCE

- Key in OFF position.

NOTE: Failure to disconnect the battery will result in false resistance readings.

- Disconnect the battery ground cable.

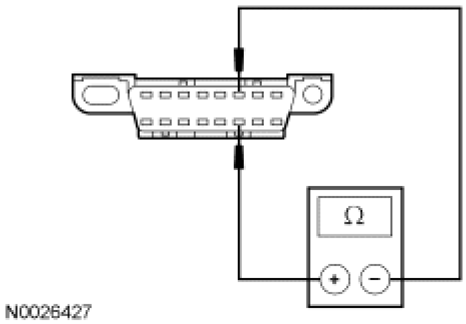

Fig. 138: Checking HS-CAN Termination Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.
- **Is the resistance between 54 and 66 ohms?**

  YES : Go to U3.

  NO : Go to **Pinpoint Test S**.

U3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND

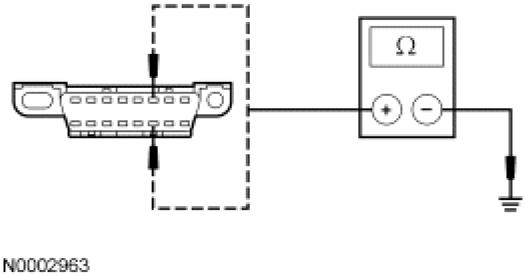

Fig. 139: Checking Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 1,000 ohms?**

  YES : Go to U4.

  NO : Go to **Pinpoint Test S**.

U4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE

- Connect the battery ground cable.
- Key in ON position.

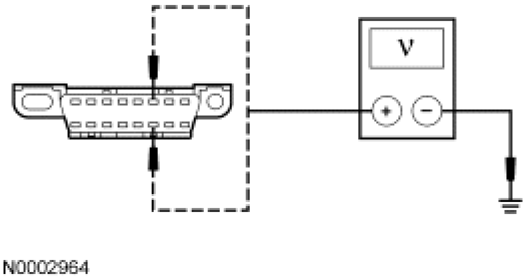

Fig. 140: Checking HS-CAN Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.
- **Is the voltage greater than 6 volts?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

  NO : Go to U5.

U5 CHECK FOR RESTORED COMMUNICATION WITH THE PCM DISABLED

NOTE:	**An integrated diagnostic system (IDS) session must be established prior to disabling the PCM in this test step. If the PCM has failed communication**

during multiple attempts to identify the vehicle, first identify the vehicle manually by entering a PCM part number, calibration number or tear tag when prompted by IDS.

NOTE: When a vehicle is manually identified by a PCM part number, calibration number or tear tag, the IDS will not automatically run a network test. The network test must be manually selected and run.

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: BJB Fuses 23 (10A), 26 (7.5A), 42 (15A (3.0L, 3.5L) or 47 (15A) (2.3L)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuses. Go to **Pinpoint Test A**.

  NO : INSTALL the removed fuses. Go to U6.

U6 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ABS MODULE AND 4X4 CONTROL MODULE (IF EQUIPPED) DISABLED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: SJB Fuses 28 (20A) and 20 (7.5A) (if equipped)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuses. If the vehicle is equipped with a 4X4 control module, go to U7. If the vehicle is not equipped with a 4X4 control module, go to **Pinpoint Test C**.

  NO : INSTALL the removed fuses. Go to U8.

U7 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ABS MODULE DISCONNECTED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: ABS Module C135
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.

- **Do all other modules pass the network test?**

  YES : CONNECT the ABS module. Go to **Pinpoint Test C**.

  NO : CONNECT the ABS module. Go to **Pinpoint Test E**.

U8 VERIFY VEHICLE EQUIPMENT - AUTOMATIC TRANSAXLE

- Inspect the vehicle for an automatic transaxle.
- **Is the vehicle equipped with an automatic transaxle?**

  YES : Go to U9.

  NO : Go to U10.

U9 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE TRANSMISSION CONTROL MODULE (TCM) DISABLED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: BJB Fuses 16 (15A) and 23 (10A) (FNR5 Transaxle Only) or Fuse 26 (7.5A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuses. Go to **Pinpoint Test B**.

  NO : INSTALL the removed fuses. Go to U10.

U10 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE INSTRUMENT CLUSTER (IC) DISABLED

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.

- Disconnect: SJB Fuses 13 (10A), 23 (7.5A) and 27 (7.5A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuses. Go to **Pinpoint Test G**.

  NO : INSTALL the removed fuses. Go to U11.

U11 VERIFY VEHICLE EQUIPMENT - ACCESSORY PROTOCOL INTERFACE MODULE (APIM)

- Inspect the vehicle for an APIM.
- **Is the vehicle equipped with an APIM?**

  YES : Go to U12.

  NO : Go to U13.

U12 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISCONNECTED

NOTE:	**When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: APIM C3338
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : CONNECT the APIM. Go to **Pinpoint Test Q**.

  NO : Go to U13.

U13 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RESTRAINTS CONTROL MODULE (RCM) DISABLED

NOTE:	**When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: SJB Fuse 25 (7.5A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. Go to **Pinpoint Test D**.

  NO : INSTALL the removed fuse. Go to U14.

U14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DISABLED

NOTE:	**When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results.**

- Disconnect: SJB Fuse 24 (7.5A)
- Enter the following diagnostic mode on the diagnostic tool: Network Test
- Repeat the network test.
- **Do all other modules pass the network test?**

  YES : INSTALL the removed fuse. Go to **Pinpoint Test F**.

  NO : INSTALL the removed fuse. An intermittent fault is not present. Go to **Pinpoint Test S**.

Pinpoint Test V: No Power To The Scan Tool

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Normal Operation

The scan tool is connected to the data link connector (DLC) to communicate with the high speed controller area network (HS-CAN) and the medium speed controller area network (MS-CAN) communications network. Voltage for the scan tool is provided by circuit SBP11 (BU/RD). Ground is provided by both circuits GD116 (BK/VT).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Scan tool

PINPOINT TEST V: NO POWER TO THE SCAN TOOL

V1 CHECK THE DLC PINS FOR DAMAGE

NOTE:	**Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

- Disconnect the scan tool cable from the DLC.

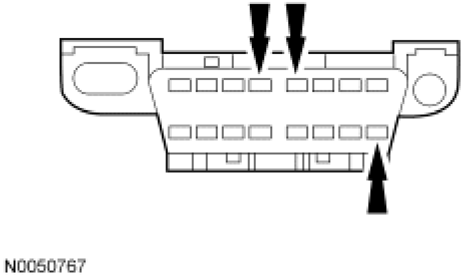

Fig. 141: Checking DLC Pins For Damage
Courtesy of FORD MOTOR CO.

- Inspect DLC pins 4, 5 and 16 for damage.
- **Are DLC pins 4, 5 and 16 OK?**

  YES : Go to V2.

  NO : REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

V2 CHECK THE DLC VOLTAGE SUPPLY CIRCUIT SBP11 (BU/RD) FOR AN OPEN

- Measure the voltage between the DLC C251-16, circuit SBP11 (BU/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to V3.

  NO : VERIFY the smart junction box (SJB) fuse 18 (20A) is OK. If OK, REPAIR the circuit. REPEAT the network test with the scan tool.

V3 CHECK THE DLC GROUND CIRCUITS GD116 (BK/VT) FOR AN OPEN

- Measure the resistance between the DLC C251-4, circuit GD116 (BK/VT), harness side and ground; and between the DLC C251-5, circuit GD116 (BK/VT), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : REPAIR the scan tool. REPEAT the network test with the scan tool.

  NO : REPAIR the circuit in question. REPEAT the network test with the scan tool.

Module Configuration - Fusion, Milan & MKZ

DIAGNOSTIC TESTS

MODULE CONFIGURATION

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Configurable modules accommodate a variety of vehicle options, eliminating the need for many unique modules for one vehicle line. These modules must be configured when replaced as part of a repair procedure.

Configurable modules should not be exchanged between vehicles since the settings are unique to each vehicle. Failure to configure a new module may result in improper operation and/or any of the following DTCs setting:

- B2477 - sets when a body/chassis module is not configured or is configured incorrectly.
- B2900 - sets when there is a VIN mismatch between the module with the B2900 and the PCM. The stored VIN in either module may be incorrect.
- P0602, P0605 and/or P1639 - sets when the PCM vehicle identification (VID) block is not configured.
- U0300 and/or U0301 - sets when the configuration between 2 or more modules do not match.
- U2050 and/or U2051 - sets when a valid strategy/calibration is not present.

The following are the 3 different methods of configuration:

- Programmable module installation (PMI)
- Module reprogramming ("flashing")
- Programmable parameters

Some modules do not support all 3 methods.

Definition of Terms

The following are definitions of configuration terms:

Programmable Module Installation (PMI)

PMI is a scan tool process which configures settings in a new module. Data used for the PMI process is automatically downloaded from the original module and stored when a scan tool session is started. If this data cannot be retrieved from the module being replaced, the scan tool may prompt for As-Built data entry or display a list of parameter values that need to be manually selected. Some modules are reprogrammed during PMI when a strategy/calibration update is available. Module reprogramming is carried out through the vehicle data link connector (DLC).

NOTE: **It is important that the scan tool identifies the vehicle and obtains configuration data prior to removing any modules. The new module must be able to communicate with the scan tool in order to carry out PMI.**

To carry out PMI, refer to Programmable Module Installation in this article.

Module Reprogramming

Module reprogramming (also referred to as "flashing") is a scan tool process which updates the strategy/calibration in a module. Module reprogramming is automatically carried out during PMI when a later strategy/calibration is available. Module reprogramming is carried out through the vehicle DLC.

Reprogramming a module with the same level of software will not improve module operation or repair a hardware failure.

NOTE: **Module reprogramming should be limited to circumstances where a published Technical Service Bulletin (TSB) procedure recommends doing so.**

NOTE: **A module cannot communicate with other modules on the communication network while being reprogrammed. Clear any network communication DTCs which may have been set in other modules during the reprogramming process.**

Accessory Protocol Interface Module (APIM) Programming

APIM programming is a process which updates the APIM consumer interface processor (CIP) and vehicle interface processor (VIP) software. The VIP programming updates the calibration files in the portion of the APIM which interfaces with the controller area network (CAN). The CIP programming updates calibration files in the portion of the APIM which interfaces with mobile phones and other customer devices.

APIM programming uses the vehicle communication module (VCM) to read and program the VIP software through the DLC. A web-based OASIS application is used to read and program the CIP software via a universal serial bus (USB) cable between the scan tool and vehicle USB port. Both the VCM and OASIS application must be running on the scan tool during APIM programming.

Programmable Parameters

Programmable parameters are customer preference items that may be modified by the dealer via scan tool or in some cases modified by the customer following a procedure listed in the vehicle Owner's Literature. While many configuration options may exist for a module, only a few of these options are programmable parameters.

Adaptive Learning and Calibration

Some modules require a separate learning procedure be carried out if replaced as part of a repair procedure. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

Vehicle Identification (VID) Block

Some PCMs contain a memory area called a vehicle identification (VID) block. The PCM VID block commonly stores powertrain configuration items such as VIN, tire size, axle ratio, and whether or not the vehicle is equipped with speed control.

As-Built Data

As-Built data is a VIN-specific module configuration record. During vehicle build, the configuration from all modules is downloaded and stored in the As-Built database. As-Built data will not reflect customer preference items that have been changed from the default state. These items will need to be changed using programmable parameters after the module is configured.

NOTE: It is not necessary to obtain As-Built data unless directed to do so by the scan tool. This data may be accessed from the technician service publication website.

BODY/CHASSIS MODULE ADDRESSES FOR AS-BUILT ENTRY

Module Name	Module Address
Accessory protocol interface module (APIM)	7D0
Audio control module (ACM)	727
Audio digital signal processing (DSP) module	783

Inspection and Verification

This section provides step-by-step module configuration procedures. Carry out the programmable module installation (PMI) procedure in this article when another workshop manual section directs to carry out configuration or when DTCs from the list below are present:

DTC CHART

DTC	Description	Source	Action
B2477	Module Configuration Failure	• Audio control module (ACM) • Audio digital signal processing (DSP) module • Driver seat module (DSM) • Dual climate control seat module (DCSM) • Instrument cluster (IC) • Occupant classification system module (OCSM)	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.

		• Parking aid module (PAM) • Restraints control module (RCM) • Satellite digital audio receiver system (SDARS) module • Smart junction box (SJB)	
B2477	Module Configuration Failure	• Accessory protocol interface module (APIM)	REFER to **Accessory Protocol Interface Module (APIM) Programming** in this article.
B2900	VIN mismatch	• 4X4 control module • ABS module • RCM	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.
P0602	Powertrain Control Module Programming Error	• PCM	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.
P0605	Internal Control Module Read Only Memory (ROM) Error	• PCM	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.
P1635	Tire/Axle Out of Acceptable Range	• 4X4 control module	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.
P1639	Vehicle ID Block Corrupted, Not Programmed	• PCM	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.
U0300	Internal Control Module Software Incompatibility	• PCM • RCM	CARRY OUT PMI. REFER to **Programmable Module Installation** in this article.

GENERAL PROCEDURES

PROGRAMMABLE MODULE INSTALLATION

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Connect the IDS and identify the vehicle as normal.
2. From the Tool box icon, select Module Programming and press the check mark.

3. Select Programmable Module Installation.
4. Select the module that is being replaced.
5. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
6. Install the new module and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. The IDS downloads the data into the new module and displays Module Configuration Complete.
9. Test module for correct operation.

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Install the new module.
2. Connect the IDS and identify the vehicle as normal.
3. From the Tool box icon, select Module Programming and press the check mark.
4. Select Programmable Module Installation.
5. Select the module that was replaced.
6. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. If the data is not available, the IDS displays a screen stating to contact the As-Built Data Center. Retrieve the data from the technician service publication website at this time and press the check mark.
9. Enter the module data and press the check mark.
10. The IDS downloads the data into the new module and displays Module Configuration Complete.
11. Test module for correct operation.

ACCESSORY PROTOCOL INTERFACE MODULE (APIM) PROGRAMMING

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
	Universal Serial Bus (USB) Male-A to Male-A Cable	CCMUSB2-AM-AM-10 or equivalent

 ST3051-A		

Accessory Protocol Interface Module (APIM) Programming Using the Integrated Diagnostic System (IDS)

NOTE: If a new accessory protocol interface module (APIM) is being installed, install the new APIM before carrying out the following procedure. For additional information, refer to INFORMATION AND ENTERTAINMENT SYSTEMS article.

1. Turn the audio control module (ACM) on.
2. Connect the scan tool to the data link connector (DLC).
3. Connect one end of the universal serial bus (USB) male-A to male-A cable to the scan tool.
4. Connect the other end of the USB male-A to male-A cable to the vehicle USB port.
5. From the technician service publication website, run OASIS using Quick Start or by manually entering the vehicle identification number (VIN).
6. From the OASIS tab, select the "Sync/APIM" bullet.
7. Select the "Read APIM" button to verify the current APIM vehicle interface processor (VIP) and consumer interface processor (CIP) software levels.

   NOTE: Do not disconnect the vehicle communication module (VCM) or USB cables during APIM programming.

8. Select the desired software level from the list of available software for programming then select the "Program APIM" button to begin the APIM programming process. Enter the APIM As-Built data if prompted.
   - When only the CIP is being programmed, select cancel when prompted whether or not to program the VIP.
   - When the VIP is programmed, the CIP will be programmed automatically.
9. The Sync/APIM application downloads the software into the APIM and displays "Programming has been completed successfully".
10. Test the audio system for correct operation.

Multifunction Electronic Modules - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Driver door module (DDM) nuts	3	27
Smart junction box (SJB) nuts	5	44

DESCRIPTION AND OPERATION

MODULE CONTROLLED FUNCTIONS

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

There are 3 multifunction electronic modules on this vehicle. They include the smart junction box (SJB), the driver door module (DDM) and the driver seat module (DSM).

Smart Junction Box (SJB)

The SJB is a combination of a multifunction electronic module and an interior fuse panel. It is located on the LH A-pillar, under the instrument panel. SJB functions control multiple vehicle systems, which include:

- Battery saver relay
- Brake shift interlock
- Delayed accessory
- Exterior lighting
- Global open (front windows only) (MKZ only, if equipped)
- Heated rear window
- Horn
- Interior lighting
- Moon roof (MKZ only, if equipped)
- Perimeter anti-theft
- Power locks
- Remote keyless entry (RKE)
- Tire pressure monitoring system (TPMS)
- Windshield wipers

Driver Door Module (DDM)

The DDM (if equipped), is located behind the LH front door panel. It controls the memory functions of the exterior driver memory mirror and, in conjunction with the driver seat module (DSM) (located under the driver seat), indirectly controls the memory seat functions. The DDM also controls the lock and unlock functions of the driver door lock actuator on vehicles with memory (seats and mirror) and receives lock/unlock input information from the door lock key cylinder switch and reset information from the driver door lock actuator.

Driver Seat Module (DSM)

The DSM (if equipped), controls the exterior passenger memory mirror and the memory seat functions.

DIAGNOSTIC TESTS

DIAGNOSTIC TROUBLE CODE (DTC) CHART

NOTE: **Most powertrain (P-code) DTCs are diagnosed in the Powertrain Control/Emissions Diagnosis (PC/ED) article. If the P-code retrieved is not listed below, refer to the Introduction - Gasoline Engines article to continue diagnostics.**

NOTE: **The smart junction box (SJB) is also known as the generic electronic module (GEM).**

DIAGNOSTIC TROUBLE CODE (DTC) CHART

DTC	Description	Source	Action
B1003	Mode Door Circuit Failure	Heating Ventilation Air Conditioning (HVAC) Module	REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
B1013	Occupant Classification System Calibration Fault	Occupant Classification System Module (OCSM)	REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article (late build vehicles only).
B1031	SDARS Satellite Antenna Open	Satellite Digital Audio Receiver System (SDARS) Module	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1032	SDARS Satellite Antenna Short	SDARS Module	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1038	Microphone Input Circuit Failure	Accessory Protocol Interface Module (APIM)	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B103B	Thermoelectric Driver	Dual Climate Control Seat	REFER to **SEATING** article.

	Overcurrent Low	Module (DCSM)	
B103C	Thermoelectric Driver Open Load	DCSM	REFER to **SEATING** article.
B103D	Blower Driver Overtemperature	DCSM	REFER to **SEATING** article.
B106A	TPMS Sensor Pressure Range Bit Incorrect State	Smart Junction Box (SJB)	REFER to **WHEELS AND TIRES** article.
B106B	Tire Pressure Sensor Low Battery	SJB	REFER to **WHEELS AND TIRES** article.
B1111	Driver Thermal Electric Device Control Overtemperature Fault	DCSM	REFER to **SEATING** article.
B1113	Passenger Thermal Electric Device Control Overtemperature Fault	DCSM	REFER to **SEATING** article.
B1117	Audio Steering Wheel Button Stuck	APIM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1117	Audio Steering Wheel Button Stuck	Audio Control Module (ACM)	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1119	Audio Disc DVD Player Thermal Shutdown	ACM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B111B	Passenger Thermoelectric Driver Overcurrent Low	DCSM	REFER to **SEATING** article.
B111C	Passenger Thermoelectric Driver Open Load	DCSM	REFER to **SEATING** article.
B111D	Passenger Blower Driver Overtemperature	DCSM	REFER to **SEATING** article.
B1136	Audio Steering Wheel Switch #2 Circuit Failure	ACM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1136	Audio Steering Wheel Switch #2 Circuit Failure	APIM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1137	Data Not Programmed	Instrument Cluster (IC)	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1138	Memory Full	IC	The SJB has 4 integrated key head transmitter (IKT) keys stored in memory and cannot program any more IKTs into the SJB memory. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1138	Memory Full	SJB	The SJB has 4 integrated key head transmitter (IKT) keys stored in memory and cannot program any more IKTs into the SJB memory. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

B1139	Invalid Transmitter Identification Code	IC	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1139	Invalid Transmitter Identification Code	SJB	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1140	Map Disk Invalid	ACM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1158	Subwoofer #2 Open	ACM	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1158	Subwoofer #2 Open	Audio Digital Signal Processing (DSP) Module	REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
B1200	Climate Control Push-button Circuit Failure	HVAC Module	REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
B1202	Fuel Sender Circuit Open	IC	REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
B1204	Fuel Sender Circuit Short to Ground	IC	REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
B1205	EIC Switch-1 Assembly Circuit Failure	IC	REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
B1209	EIC Switch-2 Assembly Circuit Failure	IC	REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
B1213	Anti-Theft Number of Programmed Keys Is Below Minimum	IC	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1231	Event Threshold Exceeded	OCSM	REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
B1231	Event Threshold Exceeded	Restraints Control Module (RCM)	REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
B1234	Mirror Switch Invalid Code	Driver Door Module (DDM)	REFER to **REAR VIEW MIRRORS** article.
B1247	Panel Dim Switch Circuit Open	SJB	REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article.
B1251	Air Temperature Internal Sensor Circuit Open	HVAC Module	REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
B1253	Air Temperature Internal Sensor Circuit Short to	HVAC Module	REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION**

	Ground		**AND DIAGNOSTICS** article.
B1255	Air Temperature External Sensor Circuit Open	HVAC Module	REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
B1257	Air Temperature External Sensor Circuit Short to Ground	HVAC Module	REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
B1299	Power Supply Sensor Circuit Short to Ground	Parking Aid Module (PAM)	REFER to **PARKING AID** article.
B1309	Power Door Lock Circuit Short to Ground	SJB	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1317	Battery Voltage High	4X4 Control Module	REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.

DRIVER DOOR MODULE (DDM)

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The driver door module (DDM) is on the controller area network (CAN) communication network. In order to support several vehicle subsystems, the module supports communications between various modules and also supports scan tool communications.

The DDM controls the driver memory power exterior mirror. This feature allows the driver to program personalized mirror positions. Once the driver stores a mirror position, the driver can recall the setting by pressing the corresponding memory switch or by using a programmed remote keyless entry (RKE) transmitter.

Refer to **REAR VIEW MIRRORS** article. The DDM also controls the lock/unlock functions of the driver door lock actuator and receives lock/unlock input information from the door lock key cylinder switch and reset information from the driver door lock actuator on vehicles with memory.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Smart junction box (SJB) fuse 20 (7.5A) • Wiring, terminals or connectors • Driver door module (DDM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power to The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the DDM.
9. If the DTCs retrieved are related to the concern, go to **Diagnostic Trouble Code (DTC) Chart**.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the driver door module (DDM)	• Fuse • Wiring, terminals or connectors • DDM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.

DRIVER SEAT MODULE (DSM)

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

The driver seat module (DSM) is on the controller area network (CAN) communication network. To support several vehicle subsystems, the module permits intermodule and scan tool communications.

The DSM controls the memory driver seat and the passenger memory power exterior mirror. This passenger memory power exterior mirror feature allows the driver to program personalized mirror positions. Once the driver stores a memory position, the driver can recall the setting by pressing the corresponding memory switch or by using a programmed remote keyless entry (RKE) transmitter. Refer to **SEATING** article.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Battery junction box (BJB) fuses: ○ 15 (10A) ○ 32 (30A) • Wiring, terminals or connectors • Driver seat module (DSM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power to The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM.
9. If the DTCs retrieved are related to the concern, go to **Diagnostic Trouble Code (DTC) Chart**.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

REMOVAL AND INSTALLATION

DRIVER DOOR MODULE (DDM)

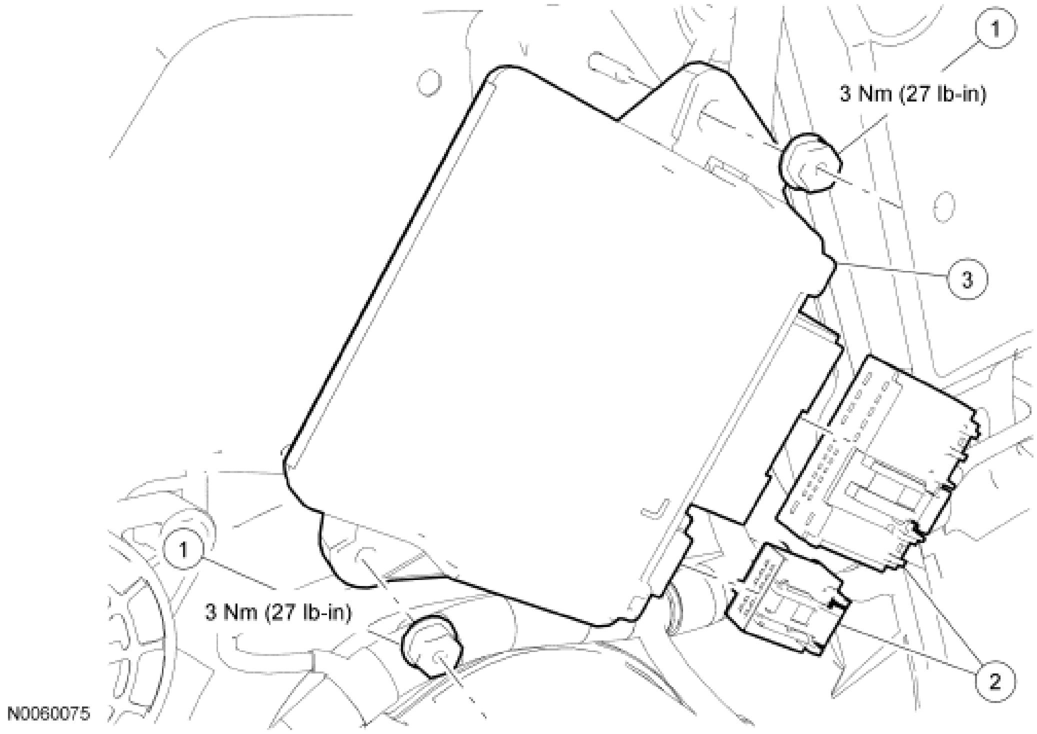

Fig. 1: Exploded View Of Driver Door Module (DDM) With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Driver door module (DDM) nuts (2 required)
2	-	DDM electrical connectors (part of 14631)
3	13C791	DDM

REMOVAL AND INSTALLATION

NOTE: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to the appropriate scan tool. This information needs to be downloaded into the new module once installed. For additional information, refer to MODULE CONFIGURATION article.

1. Upload the module configuration information from the driver door module (DDM) into the scan tool. For additional information, refer to **MODULE CONFIGURATION** article.
2. Remove the driver door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Remove the 2 nuts.

- To install, tighten to 3 Nm (27 lb-in).

4. Disconnect the 2 electrical connectors and remove the DDM.
5. To install, reverse the removal procedure.
   - Download the DDM configuration from the scan tool into the new DDM. For additional information, refer to **MODULE CONFIGURATION** article.

DRIVER SEAT MODULE (DSM)

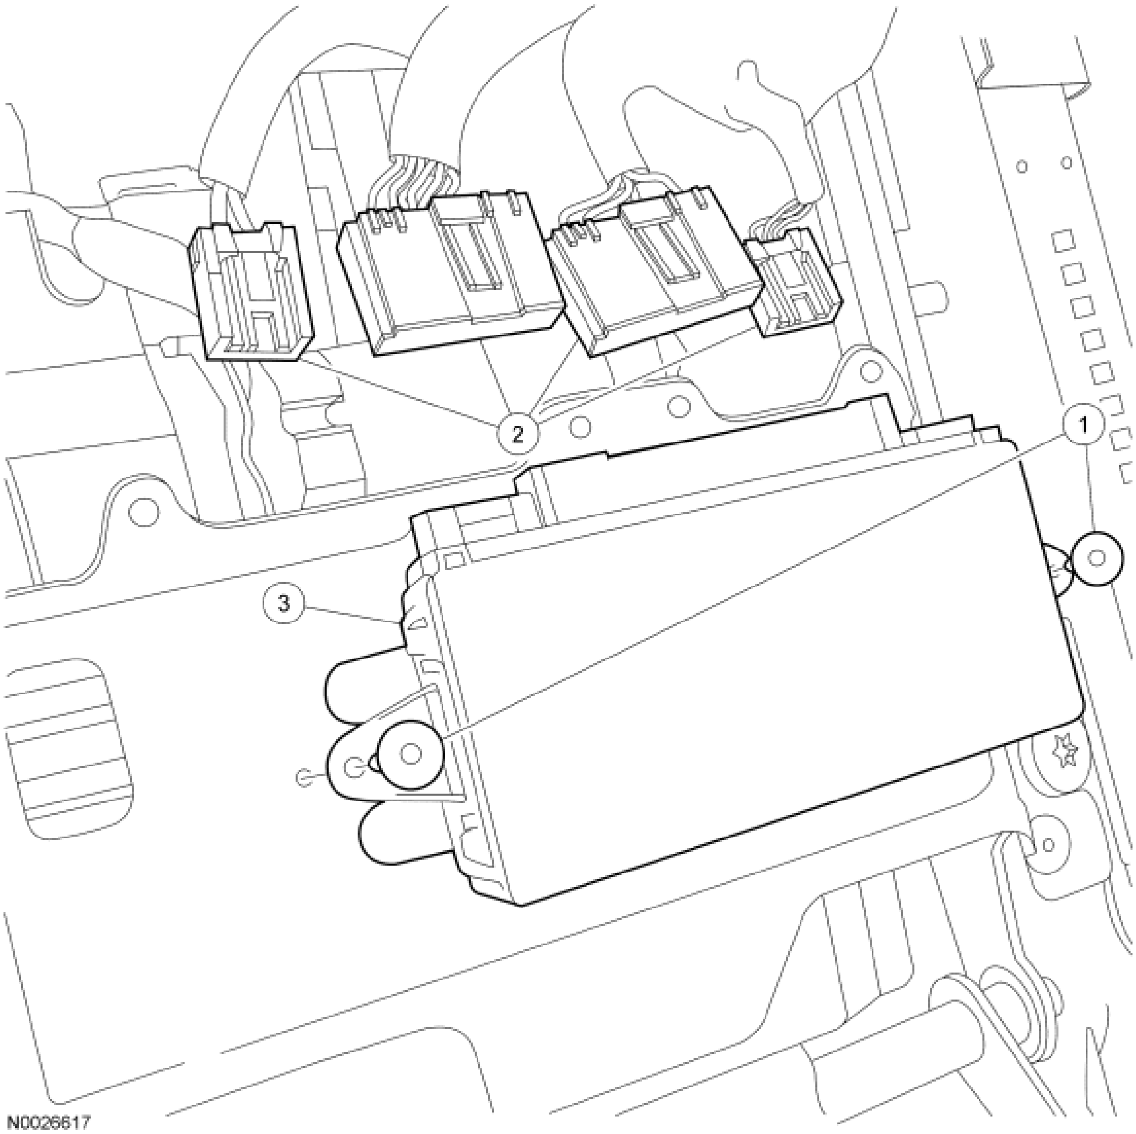

Fig. 2: Exploded View Of Driver Seat Module (DSM)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Driver seat module (DSM) rivets (2 required)

2	-	DSM electrical connectors (part of 14A699)
3	13C789	DSM

REMOVAL AND INSTALLATION

NOTE: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to the appropriate scan tool. This information needs to be downloaded into the new module once installed. For additional information, refer to MODULE CONFIGURATION article.

1. Upload the module configuration information from the driver seat module (DSM) into the scan tool. For additional information, refer to **MODULE CONFIGURATION** article.
2. Disconnect the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the driver seat. For additional information, refer to **SEATING** article.
4. Drill out the 2 rivets.
5. Disconnect the 4 electrical connectors and remove the DSM.
6. To install, reverse the removal procedure.
   - Download the DSM configuration from the scan tool into the new DSM. For additional information, refer to **MODULE CONFIGURATION** article.

SMART JUNCTION BOX (SJB)

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

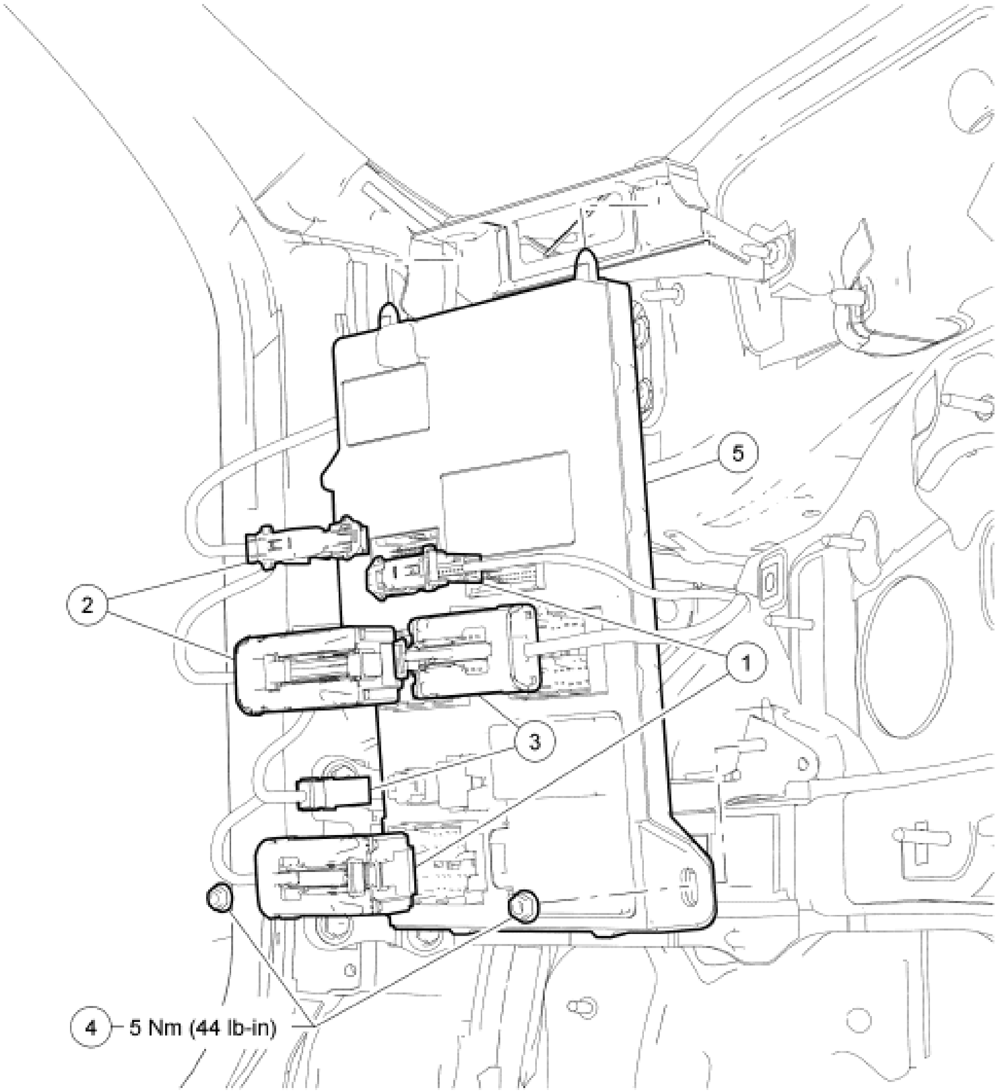

Fig. 3: Exploded View Of Smart Junction Box (SJB) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Smart junction box (SJB) electrical connectors (part of 14401)
2	-	SJB electrical connectors (part of 14A005)
3	-	SJB electrical connectors (part of 14290)
4	-	SJB nuts (2 required)
5	-	SJB

REMOVAL

NOTE: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage to the module may result.

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to a scan tool. This information must be downloaded into the new SJB after installation. For additional information, refer to <u>MODULE CONFIGURATION</u> article.

NOTE: The tire pressure monitoring system (TPMS) functionality is integral to the SJB.

NOTE: This step is only necessary if the SJB is being replaced.

NOTE: A new SJB is delivered in a "manufacturing mode" with 7 pre-set DTCs. A successful configuration of the SJB, then a successful TPMS sensor training, then a successful self-test including the clearing of all DTCs is required in order to clear the 7 pre-set manufacturing mode DTCs. The 7 manufacturing mode DTCs are:

- **B106D (Tire Pressure Monitor System [TPMS] Initiators Not Configured) This DTC is present when the SJB is not configured, even on applications that are not equipped with initiators.**
- **B2477 (Module Configuration Failure)**
- **B2868 (Left Front Tire Pressure Sensor Fault)**
- **B2869 (Right Front Tire Pressure Sensor Fault)**
- **B2870 (Right Rear Tire Pressure Sensor Fault)**
- **B2871 (Left Rear Tire Pressure Sensor Fault)**
- **C2780 (ECU in Manufacturer Sub-State)**

1. Upload the module configuration information from the SJB into the scan tool. For additional information, refer to **<u>MODULE CONFIGURATION</u>** article.
2. Disconnect the 6 electrical connectors.
3. Remove the 2 nuts and the SJB.

INSTALLATION

1. Position the SJB and install the 2 nuts.
   - Tighten to 5 Nm (44 lb-in).

NOTE: If the SJB is not being replaced, this is the last step that is necessary.

2. Connect the 6 electrical connectors.

NOTE: When successful, this step provides the calibration necessary for the SJB operation and clears the DTCs B106D and B2477. The clearing of these DTCs indicates the calibration data has been successfully downloaded to

the SJB.

NOTE: **If the PMI procedure was not followed when a new SJB was installed, the remote keyless entry (RKE) function (from the integrated key head transmitter [IKT]) of the SJB must be programmed, or the IKT RKE functions will be inoperative. IKTs can be programmed to the new SJB by cycling each IKT key to the ON position for a minimum of 6 seconds. If a new instrument cluster was installed, the IKT keys must be programmed to the new instrument cluster. For additional information, refer to ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) article.**

3. Download the SJB configuration information from the scan tool to the SJB. For additional information, refer to **MODULE CONFIGURATION** article.

NOTE: **When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the SJB has recognized the tire pressure sensors during the training procedure.**

4. Train the tire pressure sensors. For additional information, refer to **WHEELS AND TIRES** article.

NOTE: **DTC C2780 will not clear if any other DTCs are present in the SJB.**

5. Carry out the SJB on-demand self-test by clearing the DTCs and then retrieving the DTCs to confirm all DTCs have been cleared.

2008 ACCESSORIES & BODY, CAB

Parking Aid - Fusion, Milan & MKZ

SPECIFICATIONS

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Azimuth system check object position 1 (P1) and position 5 (P5), distance from sensor	30 cm (12 in) rear
Azimuth system check object position 2 (P2) and position 4 (P4), distance from sensor	91 cm (36 in) rear
Azimuth system check object position 3 (P3), distance from sensor	152 cm (60 in) rear

DESCRIPTION AND OPERATION

PARKING AID

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The parking aid system calculates the distance to an object around the rear of the vehicle by the use of 4 ultrasonic sensors. The parking aid system detects objects behind the vehicle when the REVERSE (R) gear is selected.

The parking aid system consists of:

- Parking aid sensors (located in the rear bumper cover)
- Parking aid module (PAM) (located behind the LH rear seat trim panel)
- Parking aid speaker (located under the left side of the parcel shelf)
- Parking aid disable feature (integral to the instrument cluster message center)

DIAGNOSTIC TESTS

PARKING AID

Special Tools

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R0057 or equivalent

 ST1137-A		
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The parking aid sensors detect objects approximately 1.6 m (5.3 ft) from the rear of the vehicle, 50 cm (1.6 ft) from the rear side of the vehicle, and 16 cm (6 in) above the ground. The parking aid module (PAM) calculates the distance to an object within the 170 degree semicircular azimuth area around the rear of the vehicle. A variable warning tone is generated from a parking aid speaker attached to the PAM. The parking aid speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 25 cm (10 in) of the sensors, the warning tone becomes continuous.

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid system is disabled if a fault is detected in 1 of the 4 sensors, the parking aid speaker, or the PAM. This is indicated by the parking aid disabled warning in the message center.

The PAM is on the medium speed controller area network (MS-CAN) and can be diagnosed with a scan tool. The PAM communicates with the scan tool, the SJB, the audio control module (ACM) and the instrument cluster (IC). The following chart describes network messages used by the parking aid module:

NOTE: Both the medium speed controller area network (MS-CAN) and the high speed controller area network (HS-CAN) are used for intermodule communication. A gateway message is transferred from one network to another network through the instrument cluster (IC). Refer to MODULE COMMUNICATIONS NETWORK article for network communication information.

PARKING AID MODULE (PAM) NETWORK COMMUNICATION MESSAGES

Broadcast Message	Originating Module	Network Type	Receiving Module
Ignition switch position	IC	MS-CAN	PAM
Parking air audio volume cutback command	PAM	MS-CAN	ACM
Parking aid enabled status	IC	MS-CAN	PAM
Parking aid system status	PAM	MS-CAN	IC
Transmission selector (PRNDL) range	TCM	HS-CAN	IC
Transmission selector (PRNDL) range (gateway)	IC	MS-CAN	PAM
Vehicle speed	PCM	HS-CAN	IC
Vehicle speed (gateway)	IC	MS-CAN	PAM

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Smart junction box (SJB) fuse 28 (10A) • Wiring, terminals or connectors • Parking aid module (PAM) • Parking aid sensors • Parking aid speaker

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PAM.

NOTE: Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the parking aid module (PAM)	• Fuse • Wiring, terminals or connectors • PAM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The parking aid is inoperative/does not operate correctly	• Parking aid sensors alignment • PAM • Rear bumper cover	• Go to **Pinpoint Test A**.
• Continuous or intermittent tone when no obstacles or fault codes are present (certain obstacles may appear "stealthy" to the system, depending on geometric shape, size and material)	• Dirty or iced over parking aid sensor (s)	• CLEAN the rear bumper and sensors with high-pressure water.
	• Parking aid sensor bezel(s) or parking aid sensor(s) locked into the rear bumper cover incorrectly • Parking aid sensors are not aligned correctly	• REMOVE and correctly INSTALL the parking aid sensor(s) and or bezel(s) as necessary. REFER to **Parking Aid Sensor**.
	• Parking aid sensor (s) • PAM	• CARRY OUT the azimuth system check and elevation system check. REFER to **Azimuth System Check** and **Elevation System Check**.

• The audio control module (ACM) volume does not decrease when the transmission is selected to reverse and the reverse sensing system is enabled	• Wiring, terminals or connectors • PAM	• Go to **Pinpoint Test I**.

Pinpoint Tests

Pinpoint Test A: The Parking Aid Is Inoperative/Does Not Operate Correctly

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid module (PAM) receives reverse gear input from the instrument cluster (IC) through the medium speed controller area network (MS-CAN). Voltage is supplied to the parking aid sensors from the PAM on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The parking aid module (PAM) receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG). The system can be disabled through the message center which is part of the IC.

This pinpoint test is intended to diagnose the following:

- Rear bumper cover
- Parking aid sensors alignment
- PAM

PINPOINT TEST A: THE PARKING AID IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are any PAM DTCs recorded?**

  YES : REFER to **DTC Charts**.

  NO : Go to A2.

A2 CHECK THE PARKING AID SENSORS FOR CORRECT ALIGNMENT

NOTE: If the vehicle was in a rear end collision, the parking aid sensors may not be aligned correctly.

- Check the bumper for correct alignment.
- Carry out the azimuth system check. Refer to **Azimuth System Check**.

- Carry out the elevation system check. Refer to **Elevation System Check**.
- **Does the parking aid system pass both system checks?**

  YES : Go to A3 .

  NO : REALIGN or INSTALL a new bumper cover. REFER to **BUMPERS** article. If the vehicle was in a rear end collision, further body work may be required to bring the parking aid sensors into correct alignment.

A3 CHECK FOR CORRECT REVERSE GEAR INPUT

- Apply the parking brake.
- Key in ON position.
- Select REVERSE.
- Enter the following diagnostic mode on the diagnostic tool: PAM DataLogger
- Monitor the PAM TRANSGR PID.
- **Does the PID indicate YES (transmission in reverse)?**

  YES : Go to A4.

  NO : INSTALL a new PAM. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

A4 CHECK THE MESSAGE CENTER FOR PARKING AID DISABLE OPERATION

- While observing the instrument cluster (IC) message center, disable and enable the parking aid system.
- **Does the message center display PARK AID OFF when the parking aid system is disabled, and display PARK AID ON when the parking aid system is enabled?**

  YES : Go to A5.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

A5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTCs C1700, C1703, C1706 And C1709 - Parking Aid Sensor Circuit Failure or Blockage

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).

DTC Description	Fault Trigger Conditions
C1700 - Left Rear Sensor Circuit Failure or Blockage	A continuous and on-demand DTC that sets when any of the left rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
C1703 - Right Rear Sensor Circuit Failure or Blockage	A continuous and on-demand DTC that sets when any of the right rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
C1706 - Left Rear Center Sensor Circuit Failure	A continuous and on-demand DTC that sets when any of the left rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.
C1709 - Right Rear Center Sensor Circuit Failure	A continuous and on-demand DTC that sets when any of the right rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST B: DTCs C1700, C1703, C1706 AND C1709 - PARKING AID SENSOR CIRCUIT FAILURE OR BLOCKAGE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are multiple DTCs recorded?**

  YES : Go to B2.

NO : For DTCs C1700, C1703, C1706 or C1709, go to B3.

For all other DTCs, REFER to **DTC Charts**.

B2 CHECK THE BUMPER WIRING HARNESS

- Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
- **Is the bumper wiring harness OK?**

  YES : Go to B3.

  NO : REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE SENSOR CIRCUITRY FOR OPENS

- Key in OFF position.
- Disconnect: Suspect Parking Aid Sensor C4009, C4010, C4011 or C4012
- Disconnect: PAM C4014
- Measure the resistance between the PAM C4014, harness side and the suspect parking aid sensor, harness side as follows:

DTC	Rear Sensor	PAM Connector-Pin	Sensor Connector-Pin	Circuit
C1700	LH outer	C4014-9	C4009-1	LMP07 (BU/WH)
C1700	LH outer	C4014-15	C4009-2	VMP15 (YE/GN)
C1700	LH outer	C4014-12	C4009-3	RMP07 (GN/WH)
C1703	RH outer	C4014-9	C4011-1	LMP07 (BU/WH)
C1703	RH outer	C4014-16	C4011-2	VMP17 (YE/OG)
C1703	RH outer	C4014-12	C4011-3	RMP07 (GN/WH)
C1706	LH inner	C4014-9	C4010-1	LMP07 (BU/WH)
C1706	LH inner	C4014-14	C4010-2	VMP14 (WH/OG)
C1706	LH inner	C4014-12	C4010-3	RMP07 (GN/WH)
C1709	RH inner	C4014-9	C4012-1	LMP07 (BU/WH)
C1709	RH inner	C4014-13	C4012-2	VMP16 (YE/GY)
C1709	RH inner	C4014-12	C4012-3	RMP07 (GN/WH)

- **Are the resistances less than 5 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO GROUND

- Measure the resistance between the suspect parking aid sensor, harness side and ground as follows:

DTC	Rear Sensor	Connector-Pin	Circuit
C1700	LH outer	C4009-2	VMP15 (YE/GN)
C1703	RH outer	C4011-2	VMP17 (YE/OG)
C1706	LH inner	C4010-2	VMP14 (WH/OG)
